

### GENERAL DESCRIPTION

The 74LV1T08 is a single level translating 2-input AND gate that is designed for 1.6V to 5.5V  $V_{CC}$  operation. The input is designed with a low threshold circuit to match 1.8V input logic at  $V_{CC} = 3.3V$  and can be used in 1.8V to 3.3V level up translation. In addition, the 5V tolerant input pins enable level down translation (for example, 3.3V to 2.5V output at  $V_{CC} = 2.5V$ ). The output level is referenced to the supply voltage and supports 1.8V, 2.5V, 3.3V and 5.0V CMOS levels. The wide  $V_{CC}$  range allows the generation of output levels to connect to controllers or processors.

## OVERSTRESS CAUTION

1. Stresses beyond those listed in Absolute Maximum Ratings may cause permanent damage to the device. Exposure to absolute maximum rating conditions for extended periods may affect reliability. Functional operation of the device at any conditions beyond those indicated in the Recommended Operating Conditions section is not implied.
2. The input and output voltage ratings may be exceeded if the input and output clamp current ratings are observed.
3. This value is limited to 7V maximum.
4. The performance capability of a high-performance integrated circuit in conjunction with its thermal environment can create junction temperatures which are detrimental to reliability.

## ESD SENSITIVITY CAUTION

This integrated circuit can be damaged if ESD protections are not considered carefully. SGMICRO recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage. ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because even small parametric changes could cause the device not to meet the published specifications.

$$P_D = C_{PD} \times V_{CC}^2 \times f_i \times N + \Sigma(C_L \times V_{CC}^2 \times f_o)$$
 where:  
 f<sub>i</sub> = Input frequency in MHz.  
 f<sub>o</sub> = Output frequency in MHz.  
 C<sub>L</sub> = Output load capacitance in pF.  
 V<sub>CC</sub> = Supply voltage in Volts.  
 N = Number of inputs switching.  
 Σ(C<sub>L</sub> × V<sub>CC</sub><sup>2</sup> × f<sub>o</sub>) = Sum of the outputs.
