

HX8631/HX8632/HX8634

470 μ A, 6MHz, Rail-to-Rail I/O CMOS Operational Amplifier

PRODUCT DESCRIPTION

The HX8631(single), HX8632(dual), and HX8634 (quad) are low noise, low voltage, and low power power operational amplifiers, that can be designed into a wide range of applications. The HX8631/2/4 have a high gain-bandwidth product of 6MHz, a slew rate of 3.7V/ μ s, and a quiescent current of 470 μ A/amplifier at 5V.

The HX8631/2/4 are designed to provide optimal performance in low voltage and low noise systems. They provide rail-to-rail output swing into heavy loads. The input common-mode voltage range includes ground, and the maximum input offset voltage are 3.5mV for HX8631/2/4. They are specified over the extended industrial temperature range (-40°C to +85°C). The operating range is from 2.5V to 5.5V.

The single version, HX8631, is available in SC70-5, and SOT23-5 packages. The dual version HX8632 is available in SO-8 and MSOP-8 packages. The quad version HX8634 is available in SO-16 and TSSOP-16 packages.

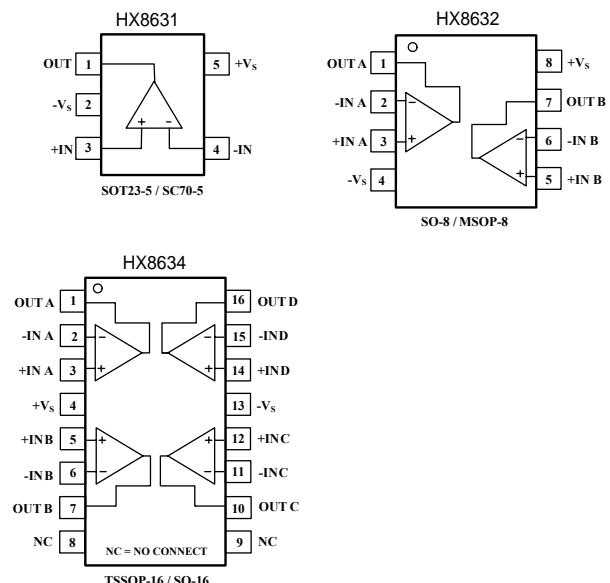

APPLICATIONS

- Sensors
- Audio
- Active Filters
- A/D Converters
- Communications
- Test Equipment
- Cellular and Cordless Phones
- Laptops and PDAs
- Photodiode Amplification
- Battery-Powered Instrumentation

FEATURES

- Low Cost
- Rail-to-Rail Input and Output
0.8mV Typical V_{OS}
- High Gain-Bandwidth Product: 6MHz
- High Slew Rate: 3.7V/ μ s
- Settling Time to 0.1% with 2V Step: 2.1 μ s
- Overload Recovery Time: 0.9 μ s
- Low Noise : 12 nV/ \sqrt{Hz}
- Operates on 2.5 V to 5.5V Supplies
- Input Voltage Range = - 0.1 V to +5.6 V with $V_S = 5.5$ V
- Low Power
470 μ A/Amplifier Typical Supply Current
- Small Packaging
HX8631 Available in SC70-5, SOT23-5
HX8632 Available in MSOP-8 and SO-8
HX8634 Available in TSSOP-16 and SO-16

PIN CONFIGURATIONS (Top View)

ORDERING INFORMATION

DEVICE	Package Type	MARKING	Packing	Packing Qty

ABSOLUTE MAXIMUM RATINGS

Supply Voltage, V+ to V-	7.5 V
Common-Mode Input Voltage (-V _S) - 0.5 V to (+V _S) +0.5V	
Storage Temperature Range.....	-65°C to +150°C
Junction Temperature.....	160°C
Operating Temperature Range.....	-40°C to +85 °C
Package Thermal Resistance @ T _A = 25°C	
SC70-5, θ _{JA}	333°C/W
SOT23-5, θ _{JA}	190°C/W
SO-8, θ _{JA}	125°C/W
MSOP-8, θ _{JA}	216°C/W
SO-16, θ _{JA}	82°C/W
TSSOP-16, θ _{JA}	105°C/W
Lead Temperature Range (Soldering 10 sec)	260°C
ESD Susceptibility	
HBM.....	1500V
MM.....	400V

NOTES

1. Stresses above those listed under Absolute Maximum Ratings may cause permanent damage to the device. This is a stress rating only; functional operation of the device at these or any other conditions above those indicated in the operational section of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

CAUTION

This integrated circuit can be damaged by ESD. Shengbang Micro-electronics recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage. ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

ELECTRICAL CHARACTERISTICS : $V_S = +5V$

(At $T_A = +25^\circ C$, $V_{CM} = V_S/2$, $R_L = 600\Omega$, unless otherwise noted)

APPLICATION NOTES

Driving Capacitive Loads

The HX863x can directly drive 1000pF in unity-gain without oscillation. The unity-gain follower (buffer) is the most sensitive configuration to capacitive loading. Direct capacitive loading reduces the phase margin of amplifiers and this results in ringing or even oscillation. Applications that require greater capacitive drive capability should use an isolation resistor between the output and the capacitive load like the circuit in Figure 1. The isolation resistor R_{ISO} and the load capacitor C_L form a zero to increase stability. The bigger the R_{ISO} resistor value, the more stable V_{OUT} will be. Note that this method results in a loss of gain accuracy because R_{ISO} forms a voltage divider with the R_{LOAD} .

Figure 1. Indirectly Driving Heavy Capacitive Load

An improvement circuit is shown in Figure 2. It provides DC accuracy as well as AC stability. R_F provides the DC accuracy by connecting the inverting signal with the output. C_F and R_{ISO} serve to counteract the loss of phase margin by feeding the high frequency component of the output signal back to the amplifier's inverting input, thereby preserving phase margin in the overall feedback loop.

Figure 2. Indirectly Driving Heavy Capacitive Load with DC Accuracy

For no-buffer configuration, there are two other ways to increase the phase margin: (a) by increasing the amplifier's gain or (b) by placing a capacitor in parallel with the feedback resistor to counteract the parasitic capacitance associated with inverting node.

Power-Supply Bypassing and Layout

The HX863x family operates from either a single +2.5V to +5.5V supply or dual $\pm 1.25V$ to $\pm 2.75V$ supplies. For single-supply operation, bypass the power supply V_{DD} with a 0.1 μF ceramic capacitor which should be placed close to the V_{DD} pin. For dual-supply operation, both the V_{DD} and the V_{SS} supplies should be bypassed to ground with separate 0.1 μF ceramic capacitors. 2.2 μF tantalum capacitor can be added for better performance.

Good PC board layout techniques optimize performance by decreasing the amount of stray capacitance at the op amp's inputs and output. To decrease stray capacitance, minimize trace lengths and widths by placing external components as close to the device as possible. Use surface-mount components whenever possible.

For the operational amplifier, soldering the part to the board directly is strongly recommended. Try to keep the high frequency big current loop area small to minimize the EMI (electromagnetic interfacing).

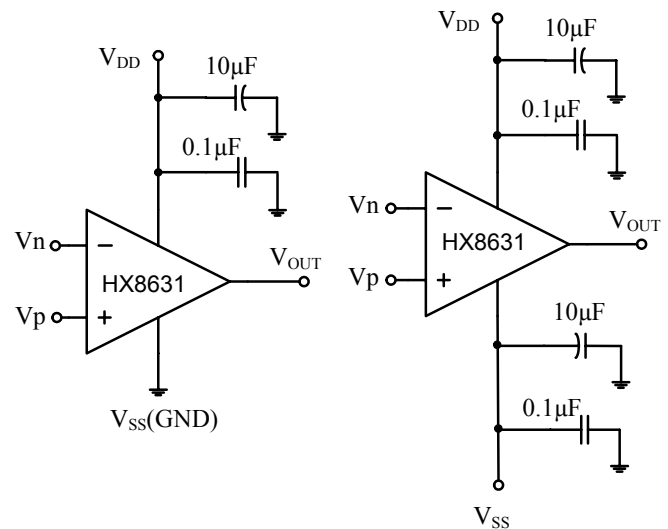

Figure 3. Amplifier with Bypass Capacitors

Grounding

A ground plane layer is important for HX863x circuit design. The length of the current path speed currents in an inductive ground return will create an unwanted voltage noise. Broad ground plane areas will reduce the parasitic inductance.

Input-to-Output Coupling

To minimize capacitive coupling, the input and output signal traces should not be parallel. This helps reduce unwanted positive feedback.

Typical Application Circuits

Differential Amplifier

The circuit shown in Figure 4 performs the difference function. If the resistors ratios are equal ($R4 / R3 = R2 / R1$), then $V_{OUT} = (Vp - Vn) \times R2 / R1 + Vref$.

Figure 4. Differential Amplifier

Instrumentation Amplifier

The circuit in Figure 5 performs the same function as that in Figure 4 but with the high input impedance.

Figure 5. Instrumentation Amplifier

Low Pass Active Filter

The low pass filter shown in Figure 6 has a DC gain of $(-R2/R1)$ and the -3dB corner frequency is $1/2\pi R2C$. Make sure the filter is within the bandwidth of the amplifier. The Large values of feedback resistors can couple with parasitic capacitance and cause undesired effects such as ringing or oscillation in high-speed amplifiers. Keep resistors value as low as possible and consistent with output loading consideration.
