## Integrated 5-Port 10/100 QoS Switch

## Features

- Integrated Switch with Five MACs and Five Fast Ethernet Transceivers Fully Compliant to IEEE 802.3u Standard
- Shared Memory Based Switch Fabric with fully Nonblocking Configuration
- 10BASE-T, 100BASE-TX and 100BASE-FX Modes (FX in Ports 4 and 5)
- Dual MII Configuration: MII-Switch (MAC or PHY Mode MII) and MII-P5 (PHY Mode MII)
- VLAN ID Tag/Untag Options, Per-Port Basis
- Enable/Disable Option for Huge Frame Size Up to 1916 Bytes Per Frame
- Broadcast Storm Protection with Percent Control - Global and Per-Port Basis
- Optimization for Fiber-to-Copper MediA Conversion
- Full-Chip Hardware Power-Down Support (Register Configuration not Saved)
- Per-Port-Based Software Power-Save on PHY (Idle Link Detection, Register Configuration Preserved)
- QoS/CoS Packets Prioritization Supports: Per Port, 802.1p and DiffServ-Based
- 802.1p/q Tag Insertion or Removal on a Per-Port Basis (Egress)
- Port-Based VLAN Support
- MDC and MDI/O Interface Support to Access the MII PHY Control Registers (Not All Control Registers)
- MII Local Loopback Support
- On-Chip 64Kbyte Memory for Frame Buffering (Not Shared with 1K Unicast Address Table)
- 1.4Gbps High Performance Memory Bandwidth
- Wire-Speed Reception and Transmission
- Integrated Look-Up Engine with Dedicated 1K Unicast MAC Addresses
- Automatic Address Learning, Address Aging and Address Migration
- Full-Duplex IEEE 802.3x and Half-Duplex Back Pressure Flow Control
- The Design is Optimized for Unmanaged Switch Solution where the Configuration is Done Through I/O Strapping and EEPROM Programming in $I^{2} \mathrm{C}$
- Comprehensive LED Support
- 7-Wire SNI Support for Legacy MAC Interface
- Automatic MDI/MDI-X Crossover for Plug-andPlay
- Disable Automatic MDI/MDI-X Option
- Low Power
- Core: 1.8 V
- Digital I/O: 3.3 V
- Analog I/O: 2.5 V or 3.3 V
- $0.18 \mu \mathrm{~m}$ CMOS Technology
- Commercial Temperature Range: $0^{\circ} \mathrm{C}$ to $+70^{\circ} \mathrm{C}$
- Available in a 128 -Pin PQFP Package

## Applications

- Broadband Gateway/Firewall/VPN
- Integrated DSL or Cable Modem Multi-Port Router
- Wireless LAN Access Point Plus Gateway
- Home Networking Expansion
- Standalone 10/100 Switch
- Hotel/Campus/MxU Gateway
- Enterprise VoIP Gateway/Phone
- FTTx Customer Premise Equipment
- Media Converter

## TO OUR VALUED CUSTOMERS

It is our intention to provide our valued customers with the best documentation possible to ensure successful use of your Microchip products. To this end, we will continue to improve our publications to better suit your needs. Our publications will be refined and enhanced as new volumes and updates are introduced.
If you have any questions or comments regarding this publication, please contact the Marketing Communications Department via E-mail at docerrors@microchip.com. We welcome your feedback.

## Most Current Data Sheet

To obtain the most up-to-date version of this data sheet, please register at our Worldwide Web site at: http://www.microchip.com
You can determine the version of a data sheet by examining its literature number found on the bottom outside corner of any page. The last character of the literature number is the version number, (e.g., DS30000000A is version A of document DS30000000).

## Errata

An errata sheet, describing minor operational differences from the data sheet and recommended workarounds, may exist for current devices. As device/documentation issues become known to us, we will publish an errata sheet. The errata will specify the revision of silicon and revision of document to which it applies.
To determine if an errata sheet exists for a particular device, please check with one of the following:

- Microchip's Worldwide Web site; http://www.microchip.com
- Your local Microchip sales office (see last page)

When contacting a sales office, please specify which device, revision of silicon and data sheet (include -literature number) you are using.

## Customer Notification System

## KSZ8995XA

### 1.0 INTRODUCTION

### 1.1 General Description

The KS8995XA is a highly integrated Layer-2 quality of service (QoS) switch with optimized bill of materials (BOM) cost for low port count, cost-sensitive 10/100Mbps switch systems. It also provides an extensive feature set including three different QoS priority schemes, a dual MII interface for BOM cost reduction, rate limiting to offload CPU tasks, software and hardware power-down, a MDC/MDIO control interface and port mirroring/monitoring to effectively address both current and emerging Fast Ethernet applications.

The KS8995XA contains five 10/100 transceivers with patented mixed-signal low-power technology, five media access control (MAC) units, a high-speed non-blocking switch fabric, a dedicated address lookup engine, and an on-chip frame buffer memory.

### 3.0 FUNCTIONAL DESCRIPTION

The KS8995XA contains five 10/100 physical layer transceivers and five media access control (MAC) units with an integrated Layer 2 switch. The device runs in three modes. The first mode is as a five-port integrated switch. The second is as a five-port switch with the fifth port decoupled from the physical port. In this mode access to the fifth MAC is provided through a media independent interface (MII). This is useful for implementing an integrated broadband router. The third mode uses the dual MII feature to recover the use of the fifth PHY. This allows the additional broadband gateway configuration, where the fifth PHY may be accessed through the MII-P5 port.
The KS8995XA is optimized for an unmanaged design in which the configuration is achieved through I/O strapping or EEPROM programming at system reset time.
On the media side, the KS8995XA supports IEEE 802.3 10BASE-T, 100BASE-TX on all ports, and 100BASE-FX on ports 4 and 5 . The KS8995XA can be used as two separate media converters.

Physical signal transmission and reception are enhanced through the use of patented analog circuitry that makes the design more efficient and allows for lower power consumption and smaller chip die size.
The major enhancements from the KS8995E to the KS8995XA are support for programmable rate limiting, a dual MII interface, MDC/MDIO control interface for IEEE 802.3-defined register configuration (not all the registers), per-port broadcast storm protection, local loopback and lower power consumption.
The KS8995XA is pin-compatible to the managed switch, the KS8995M.

### 3.1 Physical Layer Transceiver

### 3.1.1 100BASE-TX TRANSMIT

The 100BASE-TX transmit function performs parallel-to-serial conversion, 4B/5B coding, scrambling, NRZ-to-NRZI conversion, MLT3 encoding and transmission. The circuit starts with a parallel-to-serial conversion, which converts the MII data from the MAC into a 125 MHz serial bit stream. The data and control stream is then converted into 4B/5B coding and followed by a scrambler. The serialized data is further converted from NRZ to NRZI format, and then transmitted in MLT3 current output. The output current is set by an external $1 \% 3.01 \mathrm{k} \Omega$ resistor for the $1: 1$ transformer ratio. It has a typical rise/fall time of 4 ns and complies with the ANSI TP-PMD standard regarding amplitude balance, overshoot, and timing jitter. The wave-shaped 10BASE-T output is also incorporated into the 100BASE-TX transmitter.

### 3.1.2 100BASE-TX RECEIVE

The 100BASE-TX receiver function performs adaptive equalization, DC restoration, MLT3-to-NRZI conversion, data and clock recovery, NRZI-to-NRZ conversion, de-scrambling, 4B/5B decoding, and serial-to-parallel conversion. The receiving side starts with the equalization filter to compensate for inter-symbol interference (ISI) over the twisted pair cable. Because the amplitude loss and phase distortion is a function of the cable length, the equalizer must adjust its characteristics to optimize performance. In this design, the variable equalizer makes an initial estimation based on comparisons of incoming signal strength against some known cable characteristics, and then tunes itself for optimization. This is an ongoing process and self-adjusts against environmental changes such as temperature variations.
The equalized signal goes through a DC restoration and data conversion block. The DC restoration circuit is used to compensate for the effect of baseline wander and to improve the dynamic range. The differential data conversion circuit converts the MLT3 format back to NRZI. The slicing threshold is also adaptive.
The clock recovery circuit extracts the 125 MHz clock from the edges of the NRZI signal. This recovered clock is then used to convert the NRZI signal into the NRZ format. This signal is sent through the de-scrambler followed by the 4B/ 5B decoder. Finally, the NRZ serial data is converted to the MII format and provided as the input data to the MAC.

### 3.1.3 PLL CLOCK SYNTHESIZER

The KS8995XA generates $125 \mathrm{MHz}, 42 \mathrm{MHz}, 25 \mathrm{MHz}$, and 10 MHz clocks for system timing. Internal clocks are generated from an external 25 MHz crystal.

### 3.1.4 SCRAMBLER/DE-SCRAMBLER (100BASE-TX ONLY)

The purpose of the scrambler is to spread the power spectrum of the signal to reduce electromagnetic interference (EMI) and baseline wander. Transmitted data is scrambled through the use of an 11-bit wide linear feedback shift register (LFSR). The scrambler generates a 2047-bit non-repetitive sequence, and the receiver then de-scrambles the incoming data stream using the same sequence as at the transmitter.

### 3.1.5 100BASE-FX OPERATION

100BASE-FX operation is similar to 100BASE-TX operation with the differences being that the scrambler/de-scrambler and MLT3 encoder/decoder are bypassed on transmission and reception. In 100BASE-FX mode, the auto negotiation feature is bypassed since there is no standard that supports fiber auto negotiation.

### 3.1.6 100BASE-FX SIGNAL DETECTION

The physical port runs in 100BASE-FX mode if FXSDx $>0.6 \mathrm{~V}$ for ports 4 and 5 only. This signal is internally referenced to 1.25 V . The fiber module interface should be set by a voltage divider such that FXSDx ' H ' is above this 1.25 V reference, indicating signal detect, and FXSDx ' $L$ ' is below the 1.25 V reference to indicate no signal. When FXSDx is below 0.6 V then 100BASE-FX mode is disabled.

### 3.1.7 100BASE-FX FAR-END FAULT

Far end fault occurs when the signal detection is logically false from the receive fiber module. When this occurs, the transmission side signals the other end of the link by sending 841 's followed by a zero in the idle period between frames. The far end fault may be disabled through register settings.

### 3.1.8 10BASE-T TRANSMIT

The output 10BASE-T driver is incorporated into the 100BASE-T driver to allow transmission with the same magnetic. They are internally wave-shaped and pre-emphasized into outputs with a typical 2.3 V amplitude. The harmonic contents are at least 27 dB below the fundamental when driven by an all-ones Manchester-encoded signal.

### 3.1.9 10BASE-T RECEIVE

On the receive side, input buffers and level detecting squelch circuits are employed. A differential input receiver circuit and a phase-locked loop (PLL) perform the decoding function. The Manchester-encoded data stream is separated into clock signal and NRZ data. A squelch circuit rejects signals with levels less than 400 mV or with short pulse widths to prevent noise at the RXP-or-RXM input from falsely triggering the decoder. When the input exceeds the squelch limit, the PLL locks onto the incoming signal and the KS8995XA decodes a data frame. The receiver clock is maintained active during idle periods in between data reception.

### 3.1.10 POWER MANAGEMENT

The KS8995XA features a per-port power down mode. To save power, the user can power down ports that are not in use by setting the port control registers or MII control registers. In addition, there is a full-chip power down mode. When activated, the entire chip will be shut down.

### 3.1.11 MDI/MDI-X AUTO CROSSOVER

The KS8995XA supports MDI/MDI-X auto crossover. This facilitates the use of either a straight connection CAT- 5 cable or a crossover CAT-5 cable. The auto-sense function will detect remote transmit and receive pairs, and correctly assign the transmit and receive pairs from the KS8995XA device. This feature can be highly useful when end users are unaware of cable types and can also save on an additional uplink configuration connection. The auto-crossover feature may be disabled through the port control registers.

### 3.1.12 AUTO-NEGOTIATION

The KSZ8995XA conforms to the auto-negotiation protocol as described by the 802.3 committee. Auto-negotiation allows unshielded twisted pair (UTP) link partners to select the best common mode of operation. In auto-negotiation, the link partners advertise capabilities across the link to each other. If auto-negotiation is not supported or the link partner to the KS8995XA is forced to bypass auto-negotiation, then the mode is set by observing the signal at the receiver. This is known as parallel mode because while the transmitter is sending auto-negotiation advertisements, the receiver is listening for advertisements or a fixed signal protocol.
The flow for the link set up is depicted in Figure 3-1.

FIGURE 3-1: AUTO-NEGOTIATION

### 3.2 Switch Core

### 3.2.1 ADDRESS LOOKUP

The internal lookup table stores MAC addresses and their associated information. It contains a 1 K unicast address table plus switching information. The KS8995XA is guaranteed to learn 1K addresses and distinguishes itself from hashbased lookup tables which, depending on the operating environment and probabilities, may not guarantee the absolute number of addresses it can learn.

### 3.2.2 LEARNING

The internal lookup engine updates its table with a new entry if the following conditions are met:

- The received packet's source address (SA) does not exist in the lookup table.
- The received packet is good; the packet has no receiving errors and is of legal length.

The lookup engine inserts the qualified SA into the table, along with the port number and time stamp. If the table is full, the last entry of the table is deleted to make room for the new entry.

### 3.2.3 MIGRATION

The internal lookup engine also monitors whether a station has moved. If a station has moved, it will update the table accordingly. Migration happens when the following conditions are met:

- The received packet's SA is in the table, but the associated source port information is different.
- The received packet is good; the packet has no receiving errors and is of legal length.

The lookup engine will update the existing record in the table with the new source port information.

### 3.2.4 AGING

The lookup engine will update the time stamp information of a record whenever the corresponding SA appears. The time stamp is used in the aging process. If a record is not updated for a period of time, the lookup engine will remove the record from the table. The lookup engine constantly performs the aging process and will continuously remove aging records. The aging period is $300 \pm 75$ seconds. This feature can be enabled or disabled through register 3 or by external pull-up or pull-down resistors on LED[5][2]. See Register 3 section in Table 4-2.

### 3.2.5 SWITCHING ENGINE

The KS8995XA features a high performance switching engine to move data to and from the MAC's packet buffers. It operates in store and forward mode, while the efficient switching mechanism reduces overall latency.
The KS8995XA has a 64kB internal frame buffer. This resource is shared between all five ports. The buffer sharing mode can be programmed through Register 2. See Register 2 section in Table 4-2 In one mode, ports are allowed to use any free buffers in the buffer pool.
In the second mode, each port is only allowed to use $1 / 5$ of the total buffer pool. There are a total of 512 buffers available. Each buffer is sized at 128B.

### 3.2.6 MAC OPERATION

The KS8995XA strictly abides by IEEE 802.3 standards to maximize compatibility.

### 3.2.6.1 Inter Packet Gap (IPG)

If a frame is successfully transmitted, the 96 bits time IPG is measured between the two consecutive MTXEN. If the current packet is experiencing collision, the 96 bits time IPG is measured from MCRS and the next MTXEN.

### 3.2.6.2 Back-Off Algorithm

The KS8995XA implements the IEEE 802.3 standard for the binary exponential back-off algorithm, and optional "aggressive mode" back-off. After 16 collisions, the packet is optionally dropped depending on the chip configuration in Global Register 3 (0x03).

### 3.2.6.3 Late Collision

If a transmit packet experiences collisions after 512 bit times of the transmission, the packet is dropped.

### 3.2.6.4 Illegal Frames

The KS8995XA discards frames less than 64 bytes and can be programmed to accept frames up to 1536 bytes in Register 4. For special applications, the KS8995XA can also be programmed to accept frames up to 1916 bytes in Register 4. Since the KS8995XA supports VLAN tags, the maximum sizing is adjusted when these tags are present.

### 3.2.6.5 Flow Control

The KS8995XA supports standard $802.3 x$ flow control frames on both transmit and receive sides.
On the receive side, if the KSZ8995XA receives a pause control frame, the KS8995XA will not transmit the next normal frame until the timer, specified in the pause control frame, expires. If another pause frame is received before the current timer expires, the timer will be updated with the new value in the second pause frame. During this period (being flow controlled), only flow control packets from the KS8995XA will be transmitted.
On the transmit side, the KS8995XA has intelligent and efficient ways to determine when to invoke flow control. The flow control is based on availability of the system resources, including available buffers, available transmit queues and available receive queues.

## KSZ8995XA

The KS8995XA will flow control a port, which just received a packet, if the destination port resource is being used up. The KS8995XA will issue a flow control frame (XOFF), containing the maximum pause time defined in IEEE standard $802.3 x$. Once the resource is freed up, the KS8995XA will send out the other flow control frame (XON) with zero pause time to turn off the flow control (turn on transmission to the port). A hysteresis feature is provided to prevent the flow control mechanism from being activated and deactivated too many times.
The KS8995XA will flow control all ports if the receive queue becomes full.

### 3.2.6.6 Half-Duplex Backpressure

A half-duplex backpressure option (Note: not in IEEE 802.3 standards) is also provided. The activation and deactivation conditions are the same as the above in full-duplex mode. If backpressure is required, the KS8995XA will send preambles to defer the other stations' transmission (carrier sense deference). To avoid jabber and excessive deference defined in 802.3 standard, after a certain time it will discontinue the carrier sense but it will raise the carrier sense quickly. This short silent time (no carrier sense) is to prevent other stations from sending out packets and keeps other stations in carrier sense deferred state. If the port has packets to send during a backpressure situation, the carrier sense type back pressure will be interrupted and those packets will be transmitted instead. If there are no more packets to send, carrier sense type backpressure will be active again until switch resources free up. If a collision occurs, the binary exponential back-off algorithm is skipped and carrier sense is generated immediately, reducing the chance of further colliding and maintaining carrier sense to prevent reception of packets.
To ensure no packet loss in 10 BASE-T or 100 BASE-TX half-duplex modes, the user must enable the following:

- Aggressive backoff (register 3, bit 0)
- No excessive collision drop (register 4, bit 3)
- Back pressure (register 4, bit 5)

These bits are not set as defaults because this is not the IEEE standard.

### 3.2.6.7 Broadcast Storm Protection

The KS8995XA has an intelligent option to protect the switch system from receiving too many broadcast packets. Broadcast packets will be forwarded to all ports except the source port, and thus use too many switch resources (bandwidth and available space in transmit queues). The KS8995XA has the option to include "multicast packets" for storm control. The broadcast storm rate parameters are programmed globally, and can be enabled or disabled on a per port basis. The rate is based on a 50 ms interval for 100BT and a 500 ms interval for 10BT. At the beginning of each interval, the counter is cleared to zero, and the rate limit mechanism starts to count the number of bytes during the interval. The rate definition is described in Register 6 and Register 7. The default setting for registers 6 and 7 is $0 \times 4 \mathrm{~A}$, which is 74 decimal. This is equal to a rate of $1 \%$, calculated as follows:
148,800 frames $/ \mathrm{sec} \times 50 \mathrm{~ms} /$ interval $\times 1 \%=74$ frames/interval (approx.) $=0 \times 4$

### 3.2.7 MII INTERFACE OPERATION

The media independent interface (MII) is specified by the IEEE 802.3 committee and provides a common interface between physical layer and MAC layer devices. The KS8995XA provides two such interfaces. The MII-P5 interface is used to connect to the fifth PHY, whereas the MII-SW interface is used to connect to the fifth MAC. Each of these MII interfaces contains two distinct groups of signals, one for transmission and the other for receiving. The table below describes the signals used in the MII-P5 interface.
The MII-P5 interface operates in PHY mode only, while the MII-SW interface operates in either MAC mode or PHY mode. These interfaces are nibble-wide data interfaces and therefore run at $1 / 4$ the network bit rate (not encoded). Additional signals on the transmit side indicate when data is valid or when an error occurs during transmission. Likewise, the receive side has indicators that convey when the data is valid and without physical layer errors. For half-duplex operation, there is a signal that indicates a collision has occurred during transmission.
Note that the signal MRXER is not provided on the MII-SW interface for PHY mode operation and the signal MTXER is not provided on the MII-SW interface for MAC mode operation. Normally MRXER would indicate a receive error coming from the physical layer device. MTXER would indicate a transmit error from the MAC device. These signals are not appropriate for this configuration. For PHY mode operation, if the device interfacing with the KS8995XA has an MRXER pin, it should be tied low. For MAC mode operation, if the device interfacing with the KS8995XA has an MTXER pin, it should be tied low.

TABLE 3-1: MII - P5 SIGNALS (PHY MODE)

| MII Signal | Description | KsZ8995XA Signal |
| :---: | :---: | :---: |
| MTXEN | Transmit Enable | PMTXEN |
| MTXER | Transmit Error | PMTXER |
| MTXD3 | Transmit Data Bit 3 | PMTXD[3] |
| MTXD2 | Transmit Data Bit 2 | PMTXD[2] |
| MTXD1 | Transmit Data Bit 1 | PMTXD[1] |
| MTXD0 | Transmit Data Bit 0 | PMTXD[0] |
| MTXC | Transmit Clock | PMTXC |
| MCOL | Collision Detection | PCOL |
| MCRS | Carrier Sense | PCRS |
| MRXDV | Receive Data Valid | PMRXDV |
| MRXER | Receive Error | PMRXER |
| MRXD3 | Receive Data Bit 3 | PMRXD[3] |
| MRXD2 | Receive Data Bit 2 | PMRXD[1] |

| MCRS | SCRS | Carrier Sense | MCRS | SCRS |
| MRXDV | SMRXDV | Receive Data Valid | MRXDV | SMTXEN |
| MRXER | Not Used | Receive Error | MRXER | SMTXER |
| MRXD3 | SMRXD[3] | Receive Data Bit 3 | MRXD3 | SMTXD[3] |
| MRXD2 | SMRXD[2] | Receive Data Bit 2 | MRXD2 | SMTXD[2] |
| MRXD1 | SMRXD[1] | Receive Data Bit 1 | MRXD1 | SMTXD[1] |
| MRXD0 | SMRXD[0] | Receive Data Bit 0 | MRXD0 | SMTXD[0] |
| MRXC | SMRXC | Receive Clock | MRXC | SMTXC |

### 3.2.8 SNI INTERFACE OPERATION

The serial network interface (SNI) is compatible with some controllers used for network layer protocol processing. This interface can be directly connected to these types of devices. The signals are divided into two groups, one for transmission and the other for reception. The signals involved are described in the table below.

## TABLE 3-3: SNI SIGNALS

| SNI Signal | Description | KSZ8995XA PHY Signal |
| :---: | :---: | :---: |
| TXEN | Transmit enable | SMTXEN |
| TXD | Serial transmit data | SMTXD[0] |
| TXC | Transmit clock | SMTXC |
| COL | Collision detection | SCOL |
| CRS | Carrier sense | SMRXDV |
| RXD | Serial receive data | SMRXD[0] |
| RXC | Receive clock | SMRXC |

The SNI interface is a bit wide data interface and, therefore, runs at the network bit rate (not encoded). An additional signal on the transmit side indicates when data is valid. Similarly, the receive side has an indicator that conveys when the data is valid.
For half-duplex operation, the SCOL signal is used to indicate that a collision has occurred during transmission.

### 3.3 Advanced Functionality

### 3.3.1 QOS SUPPORT

The KS8995XA is a QoS switch, meaning that is it able to identify selected packets on its ingress ports, prioritize them, and service the packets according to their priority on the egress ports. In this way, the KS8995XA can provide statistically better service to the high priority packets that are latency sensitive, or require higher bandwidth. The KS8995XA supports ingress QoS classification using three different mechanisms: port-based priority, 802.1 p tag-based priority, and DSCP priority for IPv4 packets.
Port-based priority is useful when the user wants to give a device on a given port high priority. For example in Figure 7, port 1 is given high priority because it is connected to an IP phone and port 4 is given lower priority because it is connected to a computer whose data traffic may be less sensitive to network congestion. Each port on the KS8995XA can be set as high or low priority with an EEPROM. The port priority is set in bit 4 of registers $0 \times 10,0 \times 20,0 \times 30,0 \times 40,0 \times 50$ for ports $1,2,3,4$ and 5 , respectively. Port-based priority is overridden by the OR'ed result of the 802.1 p and DSCP priorities if they are all enabled at the same time.

FIGURE 3-2: PORT-BASED PRIORITY

The KS8995XA can classify tagged packets using the 802.1 p tag-based priority. In this prioritization scheme, the user can enable the 802.1 p classification on a per port basis in bit 5 of registers $0 \times 10,0 \times 20,0 \times 30,0 \times 40$ and $0 \times 50$ for ports $1,2,3,4$, and 5 , respectively. Then the user specifies the 802.1 p base priority in register $0 x 02$, bits [6-4]. When a tagged packet is received, the KS8995XA examines the 3 bit 802.1 p priority field shown in Figure 3-3. These 3 bits are compared against the base priority. The prioritization policy is as follows:

## TABLE 3-4: 802.1P PRIORITY

|  |  |
| :---: | :---: |
| 802.1 p Priority $\geq$ Base Priority | High |
| 802.1 p Priority <Base Priority | Low |

FIGURE 3-3: 802.3 TAGGED PACKET

FIGURE 3-4: IPV4 PACKET

In order to support QoS from end-to-end in a network, the KS8995XA can also classify packets based on the IPv4 DiffServ field shown in Figure 3-4.
The DiffServ field consists of 6 bits, which can be used to specify 64 code points. The KS8995XA provides 64 bits (DSCP[63:0]) in 8 registers ( $0 \times 60$ to $0 \times 67$ ), in which the user specifies the priority of each of the 64 code points. The DiffServ classification is enabled on a per port basis in bit 6 of registers $0 \times 10,0 \times 20,0 \times 30,0 \times 40$ and $0 \times 50$ for ports 1,2 , 3,4 , and 5 , respectively. If the DiffServ classification is enabled on a port, the KS8995XA will decode the IPv4 DiffServ field and look at the user defined code point bit to determine if the packet is high priority or low priority. If the code point is a ' 1 ', the packet is high priority. If the code point is ' 0 ', the packet is low priority.

## KSZ8995XA

TABLE 3-5: DIFFSERV CODE POINT

| DiffServ Field (Binary) | Code Point | KS8995X (Reg. and Bit) |
| :---: | :---: | :---: |
| 000000 | DSCP[0] | $0 \times 67$, bit 0 |
| 000001 | DSCP[1] | $0 \times 67$, bit 1 |
| 000010 | DSCP[2] | $0 \times 67$, bit 2 |
| 000011 | DSCP[3] | $0 \times 67$, bit 3 |
| 000100 | DSCP[4] | $0 \times 67$, bit 4 |
| $\bullet$ | $\bullet$ | $\bullet$ |
| $\cdot$ | $\bullet$ | $\bullet$ |
| 111011 | DSCP[59] | $0 \times 60$, bit 3 |
| 111100 | DSCP[60] | $0 \times 60$, bit 4 |
| 111101 | DSCP[61] | $0 \times 60$, bit 5 |
| 111110 | DSCP[62] | $0 \times 60$, bit 6 |
| 111111 | DSCP[63] | $0 x 60$, bit 7 |

Once classification of the packets has been determined either by port-based priority, 802.1p tag-based priority or DiffServ priority, they are placed in either the high or low priority queue on the egress port. The user can enable the egress priority queues on a per port basis by setting bit 0 of registers $0 \times 10,0 \times 20,0 \times 30,0 \times 40$, and $0 \times 50$ for ports $1,2,3,4$ and 5 , respectively. If the egress priority queue for a given port is not set, the port will treat all packets as if they are the same priority, even though packets are classified on their ingress ports. If the egress priority queue for a given port is enabled, packets are serviced based on the user programmable egress policy. The priority scheme selection is set in register $0 \times 05$ bits[3-2] as shown in Table 3-6.
TABLE 3-6: TRANSMIT PRIORITY RATIO

| Register 0x05, bit 3 | Register 0x05, bit 2 | Egress Priority Scheme |
| :---: | :---: | :---: |
| 0 | 0 | Always deliver high priority packets first |
| 0 | 1 | Deliver high/low priority packets at a ratio of $10 / 1$ |
| 1 | 0 | Deliver high/low priority packets at a ratio of $5 / 1$ |
| 1 | 1 | Deliver high/low priority packets at a ratio of $2 / 1$ |

The KS8995XA offers support for port-based, 802.1p tag-based, and IPv4 DiffServ priority, as well as programmable egress policies. These KS8995XA QoS features enable identifying, classifying and forwarding packets based on their priority. The system designer is able to use this device to build network elements that give more control over system resources, priority service to mission critical applications, and can be integrated into the next generation of multimedia networks.

### 3.3.2 RATE LIMIT SUPPORT

KS8995XA supports hardware rate limiting on "receive" and "transmit" independently on a per port basis. It also supports rate limiting in a priority or non-priority environment. The rate limit starts from OKbps and goes up to the line rate in steps of 32 Kbps . The KS8995XA uses one second as an interval. At the beginning of each interval, the counter is cleared to zero, and the rate limit mechanism starts to count the number of bytes during this interval.
For receive, if the number of bytes exceeds the programmed limit, the switch will stop receiving packets on the port until the "one second" interval expires. There is an option provided for flow control to prevent packet loss. If the rate limit is programmed greater than or equal to 128 Kbps and the byte counter is 8 K bytes below the limit, the flow control will be triggered. If the rate limit is programmed lower than 128 Kbps and the byte counter is 2 K bytes below the limit, the flow control will be triggered.

For transmit, if the number of bytes exceeds the programmed limit, the switch will stop transmitting packets on the port until the "one second" interval expires.
If priority is enabled, the KS8995XA can support different rate controls for both high priority and low priority packets. This can be programmed through Registers 21-27.

### 3.4 Configuration Interface

The KS8995XA functions as an unmanaged switch. If no EEPROM exists, the KS8995XA will operate from its default and strap-in settings.

### 3.4.1 $\quad I^{2} \mathrm{C}$ MASTER SERIAL BUS CONFIGURATION

If a 2-wire EEPROM exists, the KS8995XA can perform more advanced features like broadcast storm protection and rate control. The EEPROM should have the entire valid configuration data from register 0 to register 109 defined in the memory map, except the status registers. The configuration access time ( $\mathrm{t}_{\text {prgm }}$ ) is less than 15 ms as shown in Figure 3-5.

FIGURE 3-5: EEPROM CONFIGURATION TIMING DIAGRAM

To configure the KS8995XA with a pre-configured EEPROM use the following steps:

- At the board level, connect pin 110 on the KS8995XA to the SCL pin on the EEPROM. Connect pin 111 on the KS8995XA to the SDA pin on the EEPROM.
- Be sure the board-level reset signal is connected to the KS8995XA reset signal on pin 115 (RST_N).
- Program the contents of the EEPROM before placing it on the board with the desired configuration data. Note that the first byte in the EEPROM must be " 95 " for the loading to occur properly. If this value is not correct, all other data will be ignored.
- Place EEPROM on the board and power up the board. Assert the active-low board level reset to RST_N on the KS8995XA. After the reset is de-asserted, the KS8995XA will begin reading configuration data from the EEPROM. The configuration access time ( $\mathrm{t}_{\text {prgm }}$ ) is less than 15 ms .
Note: For proper operation, make sure pin 47 (PWRDN_N) is not asserted during the reset operation.

### 3.5 MII Management Interface (MIIM)

A standard MIIM interface is provided for all five PHY devices in the KS8995XA. An external device with MDC/MDIO capability is able to read PHY status or to configure PHY settings. For details on the MIIM interface standard, please reference the IEEE 802.3 specification (section 22.2.4.5). The MIIM interface does not have access to all the configuration registers in the KS8995XA. It can only access the standard MII registers. See Section 4.3, "MIIM Registers".

## KSZ8995XA

### 4.0 REGISTER MAP

TABLE 4-1: REGISTER MAP

| Offset |  | Description |
| :---: | :---: | :--- |
| Decimal | Hex |  |
| $0-1$ | $0 \times 00-0 \times 01$ | Chip ID Registers |
| $2-11$ | $0 \times 02-0 \times 0 B$ | Global Control Registers |
| $12-15$ | $0 \times 0 \mathrm{C}-0 \times 0 \mathrm{~F}$ | Reserved |
| $16-29$ | $0 \times 10-0 \times 1 \mathrm{D}$ | Port 1 Control Registers |
| $30-31$ | $0 \times 1 \mathrm{E}-0 \times 2 \mathrm{~F}$ | Port 1 Status Registers |
| $32-45$ | $0 \times 20-0 \times 2 \mathrm{D}$ | Port 2 Control Registers |
| $46-47$ | $0 \times 2 \mathrm{E}-0 \times 2 \mathrm{~F}$ | Port 2 Status Registers |
| $48-61$ | $0 \times 30-0 \times 3 \mathrm{D}$ | Port 3 Control Registers |
| $62-63$ | $0 \times 3 \mathrm{E}-0 \times 3 \mathrm{~F}$ | Port 3 Status Registers |
| $64-77$ | $0 \times 40-0 \times 4 \mathrm{D}$ | Port 4 Control Registers |
| $78-79$ | $0 \times 4 \mathrm{E}-0 \times 4 \mathrm{~F}$ | Port 4 Status Registers |
| $80-93$ | $0 \times 50-0 \times 5 \mathrm{D}$ | Port 5 Control Registers |
| $94-95$ | $0 \times 5 \mathrm{E}-0 \times 5 \mathrm{~F}$ | Port 5 Status Registers |
| $96-103$ | $0 \times 60-0 \times 67$ | TOS Priority Control Registers |
| $104-109$ | $0 \times 68-0 \times 6 \mathrm{D}$ | MAC Address Registers |

### 4.1 Global Registers

## TABLE 4-2: REGISTER DESCRIPTIONS

| Address | Name | Description | Mode | Default |
| :---: | :---: | :---: | :---: | :---: |
| Register 0 (0x00): Chip IDO |  |  |  |  |
| 7-0 | Family ID | Chip family | RO | 0x95 |
| Register 1 (0x01): Chip ID1/Start Switch |  |  |  |  |
| 7-4 | Chip ID | 0x0 is assigned to 95 series. (95XA) | RO | 0x0 |
| 3-1 | Revision ID | Revision ID | RO | Based on real chip revision, 0x02=B2, 0x03=B3, $0 \times 04=B 4,0 \times 05=B 5$, etc. |
| 0 | Start Switch | The chip starts automatically after trying to read the external EEPROM. If EEPROM does not exist, the chip will use default values for all internal registers. If EEPROM is present, the contents in the EEPROM will be checked. The switch will check: (1) Register $0=0 \times 95$, (2) Register 1 [7:4] = $0 \times 0$. If this check is OK, the contents in the EEPROM will override chip register default values. | RW | 0x0 |
| Register 2 (0x02): Global Control 0 |  |  |  |  |
| 7 | Reserved | Reserved | R/W | 0x0 |
| 6-4 | 802.1p Base Priority | Used to classify priority for incoming 802.1q packets. "User priority" is compared against this value $\geq$ : classified as high priority <: classified as low priority | R/W | 0x4 |

## TABLE 4-2: REGISTER DESCRIPTIONS (CONTINUED)

| Address | Name | Description | Mode | Default |
| :---: | :--- | :--- | :--- | :--- |
| 3 | Enable PHY MII | 1 = Enable PHY MII interface (note: if not enabled, <br> the switch will tri-state all outputs.) | R/W | Pin LED[5][1] strap <br> option. Pull-down (0): iso- <br> late. Pull-up (1): Enable. <br> Note: LED[5][1] has <br> internal pull-up. |
| 2 | Buffer Share <br> Mode | 1 = Buffer pool is shared by all ports. A port can <br> use more buffer when other ports are not busy. <br> $0=$ A port is only allowed to use 1/5 of the <br> buffer pool. | R/W |  |
| 1 | UNH Mode | $1=$ The switch will drop packets with 0x8808 in T/L <br> filed, or DA=01-80-C2-00-00-01. <br> $0=$ The switch will drop packets qualified as "flow <br> control" packets. | R/W | 0x1 |

Note 1: 148,800 frames $/ \mathrm{sec} \times 50 \mathrm{~ms} /$ interval $\times 1 \%=74$ frames $/$ interval (approx.) $=0 \times 4 \mathrm{~A}$

The following registers are used to enable features that are assigned on a per port basis. The register bit assignments are the same for all ports, but the address for each port is different, as indicated.

TABLE 4-3: PORT REGISTERS (REGISTERS 16-95)

| Bit | Name | R/W | Description | Default |
| :---: | :---: | :---: | :---: | :---: |
| Register 16 (0x10): Port 1 Control 0 <br> Register 32 (0x20): Port 2 Control 0 <br> Register 48 (0x30): Port 3 Control 0 <br> Register 64 (0x40): Port 4 Control 0 <br> Register 80 (0x50): Port 5 Control 0 |  |  |  |  |
| 7 | Broadcast Storm Protection Enable | R/W | 1 = Enable broadcast storm protection for ingress packets on the port <br> 0 = Disable broadcast storm protection | 0 |
| 6 | DiffServ Priority Classification Enable | R/W | 1 = Enable DiffServ priority classification for ingress packets on the port <br> 0 = Disable DiffServ function | 0 |
| 5 | 802.1p Priority Classification Enable | R/W | 1 = Enable 802.1p priority classification for ingress packets on the port 0 = Disable 802.1p | 0 |
| 4 | Port-based Priority Classification Enable | R/W | 1 = Ingress packets on the port will be classified as high priority if "DiffServ" or " 802.1 p" classification is not enabled or fails to classify. <br> $0=$ Ingress packets on port will be classified as low priority if "DiffServ" or "802.1p" classification is not enabled or fails to classify. <br> Note: "DiffServ", "802.1p" and port priority can be enabled at the same time. The OR'ed result of 802.1p and DSCP overwrites the port priority. | 0 |
| 3 | Reserved | R/W | Reserved | 0 |
| 2 | Tag Insertion | R/W | 1 = When packets are output on the port, the switch will add $802.1 \mathrm{p} / \mathrm{q}$ tags to packets without $802.1 \mathrm{p} / \mathrm{q}$ tags when received. The switch will not add tags to packets already tagged. The tag inserted is the ingress port's "port VID". <br> $0=$ Disable tag insertion | 0 |
| 1 | Tag Removal | R/W | $1=$ When packets are output on the port, the switch will remove 802.1 p/q tags from packets with $802.1 \mathrm{p} / \mathrm{q}$ tags when received. The switch will not modify packets received without tags. <br> 0 = Disable tag removal | 0 |
| 0 | Priority Enable | R/W | 1 = The port output queue is split into high and low priority queues. <br> $0=$ Single output queue on the port. There is no priority differentiation even though packets are classified into high or low priority. | 0 |

TABLE 4-3: PORT REGISTERS (REGISTERS 16-95) (CONTINUED)

| Bit | Name | R/W | Description | Default |
| :---: | :---: | :---: | :---: | :---: |
| Register 17 (0x11): Port 1 Control 1 <br> Register 33 (0x21): Port 2 Control 1 <br> Register 49 (0x31): Port 3 Control 1 <br> Register 65 (0x41): Port 4 Control 1 <br> Register 81 (0x51): Port 5 Control 1 |  |  |  |  |
| 7 | Sniffer Port | R/W | 1 = Port is designated as sniffer port and will transmit packets that are monitored. <br> $0=$ Port is a normal port | 0 |
| 6 | Receive Sniff | R/W | 1 = All packets received on the port will be marked as "monitored packets" and forwarded to the designated "sniffer port" <br> $0=$ No receive monitoring | 0 |
| 5 | Transmit Sniff | R/W | 1 = All packets transmitted on the port will be marked as "monitored packets" and forwarded to the designated "sniffer port" <br> $0=$ No transmit monitoring | 0 |
| 4-0 | Port VLAN Membership | R/W | Define the port's Port VLAN membership. Bit 4 stands for port 5, bit 3 for port 4...bit 0 for port 1. The port can only communicate within the membership. A ' 1 ' includes a port in the membership, a ' 0 ' excludes a port from membership. | 0x1f |
| Register 18 (0x12): Port 1 Control 2 <br> Register 34 (0x22): Port 2 Control 2 <br> Register 50 (0x32): Port 3 Control 2 <br> Register 66 (0x42): Port 4 Control 2 <br> Register 82 (0x52): Port 5 Control 2 |  |  |  |  |
| 7 | Reserved | - | Reserved | 0 |
| 6 | Reserved | R/W | Reserved | 0 |
| 5 | Discard Non-PVID Packets | R/W | 1 = The switch will discard packets whose VID does not match ingress port default VID. <br> $0=$ No packets will be discarded | 0 |
| 4 | Force Flow Control | R/W | 1, will always enable $R x$ and Tx flow control on the port, regardless of AN result. <br> 0 , the flow control is enabled based on AN result. <br> Note: Setting a port for both half-duplex and forced flow control is an illegal configuration. For half-duplex enable back pressure. | 0 For port 4 only, there is a special configuration pin to set the default, Pin PCOL strap option. Pulldown (0): No force flow control. Pullup (1): Force flow control. <br> Note: PCOL has internal pull-down. |

TABLE 4-3: PORT REGISTERS (REGISTERS 16-95) (CONTINUED)

| Bit | Name | R/W | Description | Default |
| :---: | :---: | :---: | :---: | :---: |
| 3 | Back Pressure Enable | R/W | 1 = Enable port's half-duplex back pressure <br> 0 = Disable port's half-duplex back pressure | Pin PMRXD2 strap option. Pull-down (0): disable back pressure. Pull-up(1): enable back pressure. <br> Note: <br> PMRXD2 has internal pulldown. |
| 2 | Transmit Enable | R/W | 1 = Enable packet transmission on the port <br> $0=$ Disable packet transmission on the port | 1 |
| 1 | Receive Enable | R/W | 1 = Enable packet reception on the port <br> $0=$ Disable packet reception on the port | 1 |
| 0 | Learning Disable | R/W | 1 = Disable switch address learning capability <br> 0 = Enable switch address learning | 0 |
| Register 19 (0x13): Port 1 Control 3 <br> Register 35 (0x23): Port 2 Control 3 <br> Register 51 (0x33): Port 3 Control 3 <br> Register 67 (0x43): Port 4 Control 3 <br> Register 83 (0x53): Port 5 Control 3 |  |  |  |  |
| 7-0 | Default Tag [15:8] | R/W | Port's default tag, containing 7-5 = User priority bits 4 = CFI bit 3-0 = VID[11:8] | 0 |
| Register 20 (0x14): Port 1 Control 4 <br> Register 36 (0x24): Port 2 Control 4 <br> Register 52 (0x34): Port 3 Control 4 <br> Register 68 (0x44): Port 4 Control 4 <br> Register 84 (0x54): Port 5 Control 4 |  |  |  |  |
| 7-0 | Default Tag [7:0] | R/W | Default port 1's tag, containing: 7-0: VID[7:0] | 1 |
| Note: Registers 19 and 20 (and those corresponding to other ports) serve two purposes: Associated with the ingress untagged packets, and used for egress tagging. Default VID for the ingress untagged or null-VID-tagged packets, and used for address lookup. |  |  |  |  |
| Register 21 (0x15): Port 1 Control 5 <br> Register 37 (0x25): Port 2 Control 5 <br> Register 53 (0x35): Port 3 Control 5 <br> Register 69 (0x45): Port 4 Control 5 <br> Register 85 (0x55): Port 5 Control 5 |  |  |  |  |
| 7-0 | Transmit High Priority Rate Control [7:0] | R/W | This register along with port control 7, bits [3:0] form a 12 -bits field to determine how many " 32 Kbps " high priority blocks can be transmitted in a unit of 4 Kbytes in a one second period). | 0 |

TABLE 4-3: PORT REGISTERS (REGISTERS 16-95) (CONTINUED)

## KSZ8995XA

### 4.2 Advanced Control Registers (Registers 96-109)

The IPv4 Type of Service (TOS) Priority Control Registers implement a fully decoded, 64-bit Differentiated Services Code Point (DSCP) register set that is used to determine priority from the 6-bit TOS field in the IP header. The most significant 6 bits of the TOS field are fully decoded into 64 possibilities, and the singular code that results is compared against the corresponding bits in the DSCP register to determine the priority. If the register bit is a 1 , the priority is high; if it is a 0 , the priority is low.

TABLE 4-4: ADVANCED CONTROL REGISTERS (REGISTERS 96-109)

| Bit | Name | Mode | Description | Default |
| :---: | :---: | :---: | :---: | :---: |
| Register 96 (0x60): TOS Priority Control Register 0 |  |  |  |  |
| 7-0 | DSCP[63:56] | R/W | - | 0000_0000 |
| Register 97 (0x61): TOS Priority Control Register 1 |  |  |  |  |
| 7-0 | DSCP[55:48] | R/W | - | 0000_0000 |
| Register 98 (0x62): TOS Priority Control Register 2 |  |  |  |  |
| 7-0 | DSCP[47:40] | R/W | - | 0000_0000 |
| Register 99 (0x63): TOS Priority Control Register 3 |  |  |  |  |
| 7-0 | DSCP[39:32] | R/W | - | 0000_0000 |
| Register 100 (0x64): TOS Priority Control Register 4 |  |  |  |  |
| 7-0 | DSCP[31:24] | R/W | - | 0000_0000 |
| Register 101 (0x65): TOS Priority Control Register 5 |  |  |  |  |
| 7-0 | DSCP[23:16] | R/W | - | 0000_0000 |
| Register 102 (0x66): TOS Priority Control Register 6 |  |  |  |  |
| 7-0 | DSCP[15:8] | R/W | - | 0000_0000 |
| Register 103 (0x67): TOS Priority Control Register 7 |  |  |  |  |
| 7-0 | DSCP[7:0] | R/W | - | 0000_0000 |
| Registers 104 to 109 define the switching engine's MAC address. This 48-bit address is used as the SA in MAC pause control frames. |  |  |  |  |
| Register 104 (0x68): MAC Address Register 0 |  |  |  |  |
| 7-0 | MACA[47:40] | R/W | - | $0 \times 00$ |
| Register 105 (0x69): MAC Address Register 1 |  |  |  |  |
| 7-0 | MACA[39:32] | R/W | - | 0x10 |
| Register 106 (0x6A): MAC Address Register 2 |  |  |  |  |
| 7-0 | MACA[31:24] | R/W | - | $0 \times A 1$ |
| Register 107 (0x6B): MAC Address Register 3 |  |  |  |  |
| 7-0 | MACA[23:16] | R/W | - | 0xff |
| Register 108 (0x6C): MAC Address Register 4 |  |  |  |  |
| 7-0 | MACA[15:8] | R/W | - | 0xff |
| Register 109 (0x6D): MAC Address Register 5 |  |  |  |  |
| 7-0 | MACA[7:0] | R/W | - | 0xff |

### 4.3 MIIM Registers

The "PHYAD" defined by IEEE is assigned as " $0 \times 1$ " for port 1 , " $0 \times 2$ " for port 2 , " $0 \times 3$ " for port 3 , " $0 \times 4$ " for port 4 , " $0 \times 5$ " for port 5 . The "REGAD" supported are $0,1,2,3,4,5$.

## TABLE 4-5: REGISTER DESCRIPTIONS

| Address | Name | Mode | Description | Default |
| :---: | :---: | :---: | :---: | :---: |
| Register 0: MII Control |  |  |  |  |
| 15 | Soft Reset | RO | $\begin{aligned} & \hline 1=\text { PHY soft reset } \\ & 0=\text { Normal operation } \end{aligned}$ | 0 |
| 14 | Loopback | W | $\begin{aligned} & 1=\text { Loopback mode (loop back at MAC) } \\ & 0=\text { Normal operation } \end{aligned}$ | 0 |

### 5.0 OPERATIONAL CHARACTERISTICS

### 5.1 Absolute Maximum Ratings*

Supply Voltage
( $\mathrm{V}_{\text {DDAR }}, \mathrm{V}_{\text {DDAP }}, \mathrm{V}_{\mathrm{DDC}}$ ) ........................................................................................................................... -0.5 V to +2.4 V
( $\mathrm{V}_{\text {DDAT }}, \mathrm{V}_{\text {DDIO }}$ ) ....................................................................................................................................... 0.5 V to +4.0 V
Input Voltage (All inputs) ........................................................................................................................ 0.5 V to +4.0 V
Output Voltage (All outputs) ..................................................................................................................... -0.5 V to +4.0 V
Lead Temperature (soldering, 10s) ...................................................................................................................... $+270^{\circ} \mathrm{C}$
Storage Temperature ( $\mathrm{T}_{\mathrm{S}}$ )................................................................................................................... $-55^{\circ} \mathrm{C}$ to $+150^{\circ} \mathrm{C}$
*Exceeding the absolute maximum rating may damage the device. Stresses greater than the absolute maximum rating may cause permanent damage to the device. Operation of the device at these or any other conditions above those specified in the operating sections of this specification is not implied. Maximum conditions for extended periods may affect reliability.

### 5.2 Operating Ratings**

Supply Voltage

$\left(\mathrm{V}_{\text {DDAT }}\right) \ldots \ldots \ldots . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . ~ 3 . ~ 3 ~ 15 V ~ t o ~+3.45 V ~ o r ~+2.4 V ~ t o ~+2.6 V ~$
( $\mathrm{V}_{\text {DDIO }}$ ) ............................................................................................................................................ +3.15 V to +3.45 V
Ambient Operating Temperature $\left(\mathrm{T}_{\mathrm{A}}\right)$
$\qquad$
Package Thermal Resistance (Note 1)
PQFP ( $\theta_{\mathrm{JA}}$ ) No air flow. $42.91^{\circ} \mathrm{C} / \mathrm{W}$

PQFP ( $\theta_{\mathrm{Jc}}$ ) No air flow $19.6^{\circ} \mathrm{C} / \mathrm{W}$
${ }^{* *}$ The device is not guaranteed to function outside its operating ratings. Unused inputs must always be tied to an appropriate logic voltage level (ground to $\mathrm{V}_{\mathrm{DD}}$ ).

Note 1: No heat spreader in package. The thermal junction to ambient $\left(\theta_{\mathrm{JA}}\right)$ and the thermal junction to case $\left(\theta_{\mathrm{JC}}\right)$ are under air velocity $0 \mathrm{~m} / \mathrm{s}$.

### 6.0 ELECTRICAL CHARACTERISTICS Note 1, Note 2

## TABLE 6-1: ELECTRICAL CHARACTERISTICS

| Parameters | Symbol | Min. | Typ. | Max. | Units | Condition |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 100BASE-TX Operation (All Ports @ 100\% Utilization) |  |  |  |  |  |  |
| 100BASE-TX (Transmitter) | $\mathrm{I}_{\mathrm{DX}}$ | - | 20 | 28 | mA | $V_{\text {DDAT }}$ |
| 100BASE-TX (Digital Core/PLL+ Analog Rx) | $\mathrm{I}_{\text {DDC }}$ | - | 157 | 230 | mA | $\mathrm{V}_{\mathrm{DDC}}, \mathrm{V}_{\text {DDAP }}, \mathrm{V}_{\text {DDAR }}$ |
| 100BASE-TX (Digital IO) | $\mathrm{I}_{\text {DDIO }}$ | - | 17 | 30 | mA | $\mathrm{V}_{\text {DDIO }}$ |
| 10BASE-TX Operation (All Ports 100\% Utilization) |  |  |  |  |  |  |
| 10BASE-T (Transmitter) | $I_{D X}$ | - | 15 | 25 | mA | $\mathrm{V}_{\text {DDAT }}$ |
| 10BASE-T (Digital Core + Analog Rx) | $\mathrm{I}_{\text {DDC }}$ | - | 102 | 180 | mA | $\mathrm{V}_{\text {DDC }}, \mathrm{V}_{\text {DDAP }}$ |
| 10BASE-T (Digital IO) | $\mathrm{I}_{\text {DIIO }}$ | - | 6 | 15 | mA | $\mathrm{V}_{\text {DDIO }}$ |
| Auto-Negotiation Mode |  |  |  |  |  |  |
| 10BASE-T (Transmitter) | $\mathrm{I}_{\mathrm{DX}}$ | - | 25 | 40 | mA | $\mathrm{V}_{\text {DDAT }}$ |
| 10BASE-T (Digital Core + Analog Rx) | $\mathrm{I}_{\text {DDC }}$ | - | 108 | 180 | mA | $\mathrm{V}_{\text {DDC }}, \mathrm{V}_{\text {DDAP }}$ |
| 10BASE-T (Digital IO) | $\mathrm{I}_{\text {DDIO }}$ | - | 17 | 20 | mA | $\mathrm{V}_{\text {DDIO }}$ |
| TTL Inputs |  |  |  |  |  |  |
| Input High Voltage | $\mathrm{V}_{\mathrm{IH}}$ | +2.0 | - | - | V | - |
| Input Low Voltage | $\mathrm{V}_{\text {IL }}$ | - | - | +0.8 | V | - |
| Input Current (Excluding Pull-up/Pull-down) | $\mathrm{I}_{\text {IN }}$ | -10 | - | 10 | $\mu \mathrm{A}$ | $\mathrm{V}_{\text {IN }}=\mathrm{GND} \sim \mathrm{V}_{\text {DDIO }}$ |
| TTL Outputs |  |  |  |  |  |  |
| Output High Voltage | $\mathrm{V}_{\mathrm{OH}}$ | +2.4 | - | - | V | $\mathrm{I}_{\mathrm{OH}}=-8 \mathrm{~mA}$ |
| Output Low Voltage | $\mathrm{V}_{\mathrm{OL}}$ | - | - | +0.4 | V | $\mathrm{I}_{\mathrm{OL}}=8 \mathrm{~mA}$ |
| Output Tri-State Leakage | $\mid l_{\text {Oz }}$ | - | - | 10 | $\mu \mathrm{A}$ | $\mathrm{V}_{\text {IN }}=\mathrm{GND} \sim \mathrm{V}_{\text {DDIO }}$ |
| 100BASE-TX Transmit (measured differentially after 1:1 transformer) |  |  |  |  |  |  |
| Peak Differential Output Voltage | $\mathrm{V}_{\mathrm{O}}$ | 0.95 | - | 1.05 | V | $100 \Omega$ termination on the differential output. |
| Output Voltage Imbalance | $\mathrm{V}_{\text {IMB }}$ | - | - | 2 | \% | $100 \Omega$ termination on the differential output. |
| Rise/Fall Time |  | 3 | - | 5 | ns | - |
| Rise/Fall Time Imbalance | $t_{r} \mu_{\mathrm{f}}$ | 0 | - | 0.5 | ns | - |
| Duty Cycle Distortion | - | - | - | $\pm 0.5$ | ns | - |
| Overshoot | - | - | - | 5 | \% | - |
| Reference Voltage of $\mathrm{ISET}^{\text {S }}$ | $\mathrm{V}_{\text {SET }}$ | - | 0.5 | - | V | - |
| Output Jitter | - | - | 0.7 | 1.4 | ns | Peak-to-peak |
| 10BASE-T Receive |  |  |  |  |  |  |
| Squelch Threshold | $\mathrm{V}_{\text {SQ }}$ | - | 400 | - | mV | 5 MHz square wave |
| 10BASE-T Transmit (measured differentially after 1:1 transformer) |  |  |  |  |  |  |
| Peak Differential Output Voltage | $V_{P}$ | - | 2.3 | - | V | $100 \Omega$ termination on the differential output |
| Jitter Added | - | - | - | $\pm 3.5$ | ns | $100 \Omega$ termination on the differential output |
| Rise/Fall Time | $\mathrm{t}_{\mathrm{r}} / \mathrm{t}_{\mathrm{f}}$ | - | 28 | - | ns | - |

Note 1: Specification for packaged product only. A single port's transformer consumes an additional about 40 mA for 100Base-TX and 59 mA for 10Base-T.
2: Measurements were taken with operating ratings.

### 7.0 TIMING SPECIFICATIONS

### 7.1 EEPROM Timing

FIGURE 7-1: EEPROM INTERFACE INPUT TIMING DIAGRAM
Receive Timing

FIGURE 7-2:

## EEPROM INTERFACE OUTPUT TIMING DIAGRAM

TABLE 7-1: EEPROM TIMING PARAMETERS

| Symbol | Parameter | Min. | Typ. | Max. | Units |
| :--- | :--- | :---: | :---: | :---: | :---: |
| $\mathrm{t}_{\mathrm{cyc} 1}$ | Clock cycle | - | 16384 | - | ns |
| $\mathrm{t}_{\mathrm{s} 1}$ | Setup time | 20 | - | - | ns |
| $\mathrm{t}_{\mathrm{h} 1}$ | Hold time | 20 | - | - | ns |
| $\mathrm{t}_{\mathrm{ov} 1}$ | Output valid | 4096 | 4112 | 4128 | ns |

### 7.2 SNI Timing

FIGURE 7-3: SNI INPUT TIMING

FIGURE 7-4:
SNI OUTPUT TIMING

TABLE 7-2: SNI TIMING PARAMETERS

| Parameter | Description | Min. | Typ. | Max. | Units |
| :--- | :--- | :---: | :---: | :---: | :---: |
| $\mathrm{t}_{\mathrm{cyc} 2}$ | Clock cycle | - | 100 | - | ns |
| $\mathrm{t}_{\mathrm{s} 2}$ | Setup time | 10 | - | - | ns |
| $\mathrm{t}_{\mathrm{h} 2}$ | Hold time | 0 | - | - | ns |
| $\mathrm{t}_{\mathrm{ov} 2}$ | Output valid | 0 | 3 | 6 | ns |

### 7.3 MII Received Timing

FIGURE 7-5: MII RECEIVED TIMING - FOR 100BASE-T

TABLE 7-3: MII RECEIVED TIMING PARAMETERS

| Parameter | Description | Min. | Typ. | Max. | Units |
| :--- | :--- | :---: | :---: | :---: | :---: |
| $\mathrm{t}_{\mathrm{P}}$ | RXC period | - | 40 | - | ns |
| $\mathrm{t}_{\mathrm{WL}}$ | RXC pulse width | 20 | - | - | ns |
| $\mathrm{t}_{\mathrm{WH}}$ | RXC pulse width | 20 | - | - | ns |
| $\mathrm{t}_{\text {SU }}$ | RXD [3:0], RXDV set-up to rising edge of RXC | - | 20 | - | ns |
| $\mathrm{t}_{\text {HD }}$ | RXD [3:0], RXDV hold from rising edge of RXC | - | 20 | - | ns |
| $\mathrm{t}_{\text {RLAT }}$ | CRS to RXD latency, 4B or 5B aligned | - | 60 | - | ns |

### 7.4 MII Transmitted Timing

FIGURE 7-6: MII TRANSMITTED TIMING - FOR 100BASE-T

TABLE 7-4: MII TRANSMITTED TIMING PARAMETERS

| Parameter | Description | Min. | Typ. | Max. | Units |
| :--- | :--- | :---: | :---: | :---: | :---: |
| $\mathrm{t}_{\text {SU1 }}$ | TXD [3:0] set-up to TXC high | 10 | - | - | ns |
| $\mathrm{t}_{\text {SU2 }}$ | TXEN set-up to TXC high | 10 | - | - | ns |
| $\mathrm{t}_{\text {HD1 }}$ | TXD [3:0] hold after TXC high | 0 | - | - | ns |
| $\mathrm{t}_{\mathrm{HD2}}$ | TXER hold after TXC high | 0 | - | - | ns |
| $\mathrm{t}_{\mathrm{CRS} 1}$ | TXEN high to CRS asserted latency | 0 | 40 | - | ns |
| $\mathrm{t}_{\mathrm{CRS} 2}$ | TXEN low to CRS de-asserted latency | - | 40 | - | ns |

### 7.5 Reset Timing

FIGURE 7-7: RESET TIMING

TABLE 7-5: RESET TIMING PARAMETERS

| Parameter | Description | Min. | Typ. | Max. | Units |
| :--- | :--- | :---: | :---: | :---: | :---: |
| $\mathrm{t}_{\mathrm{SR}}$ | Stable supply voltages to reset high | 10 | - | - | ms |
| $\mathrm{t}_{\mathrm{CS}}$ | Configuration set-up time | 50 | - | - | ns |
| $\mathrm{t}_{\mathrm{CH}}$ | Configuration hold time | 50 | - | - | ns |
| $\mathrm{t}_{\mathrm{RC}}$ | Reset to strap-in pin output | 50 | - | - | ns |

### 8.0 RESET CIRCUIT

Microchip recommends the following discrete reset circuit as shown in Table 8-1 when powering up the KS8895XA device. For the application where the reset circuit signal comes from another device (e.g., CPU, FPGA, etc), we recommend the reset circuit as shown in Table 8-2.

FIGURE 8-1: RECOMMENDED RESET CIRCUIT

FIGURE 8-2: RECOMMENDED CIRCUIT FOR INTERFACING WITH CPU/FPGA RESET

At power-on-reset, R, C, and D1 provide the necessary ramp rise time to reset the device. The reset out from CPU/ FPGA provides warm reset after power up. It is also recommended to power up the VDD core voltage earlier than VDDIO voltage. At worst case, the both VDD core and VDDIO voltages should come up at the same time.

### 9.0 SELECTION OF ISOLATION TRANSFORMER Note 1

One simple 1:1 isolation transformer is needed at the line interface. An isolation transformer with integrated commonmode choke is recommended for exceeding FCC requirements. The following table gives recommended transformer characteristics.
Table 9-1 lists recommended transformer characteristics.
TABLE 9-1: TRANSFORMER SELECTION CRITERIA

| Parameter | Value | Test Conditions |
| :---: | :---: | :---: |
| Turns Ratio | $1 \mathrm{CT}: 1 \mathrm{CT}$ | - |
| Open-Circuit Inductance (min.) | $350 \mu \mathrm{H}$ | $100 \mathrm{mV}, 100 \mathrm{kHz}, 8 \mathrm{~mA}$ |
| Leakage Inductance (max.) | $0.4 \mu \mathrm{H}$ | $1 \mathrm{MHz}(\mathrm{min})$. |
| Interwinding Capacitance (max.) | 12 pF | - |
| D.C. Resistance (max.) | $0.9 \Omega$ | - |
| Insertion Loss (max.) | 1.0 dB | 0 MHz to 65 MHz |
| HIPOT (min.) | $1500 \mathrm{~V}_{\text {RMS }}$ | - |

Note 1: The IEEE 802.3u standard for 100BASE-TX assumes a transformer loss of 0.5 dB . For the transmit line transformer, insertion loss of up to 1.3 dB can be compensated by increasing the line drive current by means of reducing the ISET resistor value.

TABLE 9-2: QUALIFIED MAGNETICS LIST

| 4-Port Integrated |  | Auto MDIX | Number of <br> Ports | Single-Port |  | Auto MDIX | Number of <br> Ports |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Vendor | Part |  |  | Part |  |  |  |
| Pulse | H1164 | Yes | 4 | Pulse | H1102 | Y |  |
| Bel Fuse | $558-5999-Q 9 ~$ | Yes | 4 | Bel Fuse | S558-5999-U7 | Yes | 1 |
| YCL | PH406466 | Yes | 4 | YCL | PT163020 | Yes | 1 |
| Transpower | HB826-2 | Yes | 4 | Transpower | HB726 | Yes | 1 |
| Delta | LF8731 | Yes | 4 | Delta | LF8505 | Yes | 1 |
| LanKom | SQ-H48W | Yes | 4 | LanKom | LF-H41S | Yes | 1 |

Note: Table 9-2 shows the transformer vendors provide compatible magnetic parts for Microchip's device:

### 10.0 PACKAGE OUTLINE

### 10.1 Package Marking Information

## 128-Lead PQFP*

| MICREL |
| :--- |
| XXXXXXXXX |
| YYWWB4 |
| XXXXYYWWNNN |
| YYWWNNN |

## Example

Legend: $\mathrm{XX} \ldots \mathrm{X}$ Product code or customer-specific information
$Y \quad$ Year code (last digit of calendar year)
YY Year code (last 2 digits of calendar year)
WW Week code (week of January 1 is week ' 01 ')
NNN Alphanumeric traceability code
Pb-free JEDEC ${ }^{\circledR}$ designator for Matte Tin (Sn)

* This package is Pb -free. The Pb -free JEDEC designator (e3)
can be found on the outer packaging for this package.
$\bullet, \boldsymbol{\Delta}, \boldsymbol{P}$ Pin one index is identified by a dot, delta up, or delta down (triangle mark).

Note: In the event the full Microchip part number cannot be marked on one line, it will be carried over to the next line, thus limiting the number of available characters for customer-specific information. Package may or may not include the corporate logo.
Underbar (_) and/or Overbar ( ${ }^{-}$) symbol may not be to scale.

FIGURE 10-1: 128-LEAD PQFP 20 MM X 14 MM PACKAGE

TITLE
128 LEAD PQFP 14x20mm PACKAGE OUTLINE \& RECOMMENDED LAND PATTERN

| DRAWING \# | PQFP14×20-128LD-PL-1 | UNIT | MM [INCHES] |
| :---: | :--- | :--- | :--- |

NOTES :

1. DIMENSION D1 AND E1 DO NOT INCLUDE MOLD PROTRUSION. ALLOWABLE PROTRUSION IS 0.25 mm PER SIDE. DIMENSIONS D1 AND E1 DO INCLUDE MOLD MISMATCH AND ARE DETERMINED AT DATUM PLANE - $\mathrm{H}-$
2. DIMENSION b DOES NOT INCLUDE DAMBAR PROTRUSION.

ALLOWABLE DAMBAR PROTRUSION SHALL BE 0.08 mm TOTAL $\operatorname{IN}$ EXCESS OF THE b DIMENSION AT MAXIMUM MATERIAL CONDITION. DAMBAR CANNOT BE LOCATED ON THE LOWER RADIUS OR THE LEAD FOOT.
3. the diagrams do not represnet the actual pin count.
4. ALL UNITS $\operatorname{IN} \mathrm{mm}$. TOLERANCE $+/-0.05$ IF NOT NOTED.

COTROL DIMENSIONS ARE IN MIUMEIERS.
RECOMMENDED LAND PATTERN

Note: For the most current package drawings, please see the Microchip Packaging Specification located at http://www.microchip.com/packaging.

## APPENDIX A: DATA SHEET REVISION HISTORY

## TABLE A-1: REVISION HISTORY

| Revision | Section/Figure/Entry | Correction |
| :---: | :--- | :--- |
| DS00003677A (10-30-2020) | - | Converted Micrel data sheet KSZ8995XA to Micro- <br> chip DS00003677A. Minor text changes throughout. |

## THE MICROCHIP WEB SITE

Microchip provides online support via our WWW site at www.microchip.com. This web site is used as a means to make files and information easily available to customers. Accessible by using your favorite Internet browser, the web site contains the following information:

- Product Support - Data sheets and errata, application notes and sample programs, design resources, user's guides and hardware support documents, latest software releases and archived software
- General Technical Support - Frequently Asked Questions (FAQ), technical support requests, online discussion groups, Microchip consultant program member listing
- Business of Microchip - Product selector and ordering guides, latest Microchip press releases, listing of seminars and events, listings of Microchip sales offices, distributors and factory representatives

## CUSTOMER CHANGE NOTIFICATION SERVICE

Microchip's customer notification service helps keep customers current on Microchip products. Subscribers will receive e-mail notification whenever there are changes, updates, revisions or errata related to a specified product family or development tool of interest.

To register, access the Microchip web site at www.microchip.com. Under "Support", click on "Customer Change Notification" and follow the registration instructions.

## CUSTOMER SUPPORT

Users of Microchip products can receive assistance through several channels:

- Distributor or Representative
- Local Sales Office
- Field Application Engineer (FAE)
- Technical Support

Customers should contact their distributor, representative or field application engineer (FAE) for support. Local sales offices are also available to help customers. A listing of sales offices and locations is included in the back of this document.
Technical support is available through the web site at: http://microchip.com/support

## PRODUCT IDENTIFICATION SYSTEM

To order or obtain information, e.g., on pricing or delivery, refer to the factory or the listed sales office.

## Note the following details of the code protection feature on Microchip devices:

- Microchip products meet the specifications contained in their particular Microchip Data Sheet.
- Microchip believes that its family of products is secure when used in the intended manner and under normal conditions.
- There are dishonest and possibly illegal methods being used in attempts to breach the code protection features of the Microchip devices. We believe that these methods require using the Microchip products in a manner outside the operating specifications contained in Microchip's Data Sheets. Attempts to breach these code protection features, most likely, cannot be accomplished without violating Microchip's intellectual property rights.
- Microchip is willing to work with any customer who is concerned about the integrity of its code.
- Neither Microchip nor any other semiconductor manufacturer can guarantee the security of its code. Code protection does not mean that we are guaranteeing the product is "unbreakable." Code protection is constantly evolving. We at Microchip are committed to continuously improving the code protection features of our products. Attempts to break Microchip's code protection feature may be a violation of the Digital Millennium Copyright Act. If such acts allow unauthorized access to your software or other copyrighted work, you may have a right to sue for relief under that Act.

Information contained in this publication is provided for the sole purpose of designing with and using Microchip products. Information regarding device applications and the like is provided only for your convenience and may be superseded by updates. It is your responsibility to ensure that your application meets with your specifications.

THIS INFORMATION IS PROVIDED BY MICROCHIP "AS IS". MICROCHIP MAKES NO REPRESENTATIONS OR WARRANTIES OF ANY KIND WHETHER EXPRESS OR IMPLIED, WRITTEN OR ORAL, STATUTORY OR OTHERWISE, RELATED TO THE INFORMATION INCLUDING BUT NOT LIMITED TO ANY IMPLIED WARRANTIES OF NON-INFRINGEMENT, MERCHANTABILITY, AND FITNESS FOR A PARTICULAR PURPOSE OR WARRANTIES RELATED TO ITS CONDITION, QUALITY, OR PERFORMANCE.

IN NO EVENT WILL MICROCHIP BE LIABLE FOR ANY INDIRECT, SPECIAL, PUNITIVE, INCIDENTAL OR CONSEQUENTIAL LOSS, damage, Cost or expense of any kind whatsoever related to the information or its use, however CAUSED, EVEN IF MICROCHIP HAS BEEN ADVISED OF THE POSSIBILITY OR THE DAMAGES ARE FORESEEABLE. TO THE FULLEST EXTENT ALLOWED BY LAW, MICROCHIP'S TOTAL LIABILITY ON ALL CLAIMS IN ANY WAY RELATED TO THE INFORMATION OR ITS USE WILL NOT EXCEED THE AMOUNT OF FEES, IF ANY, THAT YOU HAVE PAID DIRECTLY TO MICROCHIP FOR THE INFORMATION. Use of Microchip devices in life support and/or safety applications is entirely at the buyer's risk, and the buyer agrees to defend, indemnify and hold harmless Microchip from any and all damages, claims, suits, or expenses resulting from such use. No licenses are conveyed, implicitly or otherwise, under any Microchip intellectual property rights unless otherwise stated.

## Trademarks

The Microchip name and logo, the Microchip logo, Adaptec, AnyRate, AVR, AVR logo, AVR Freaks, BesTime, BitCloud, chipKIT, chipKIT logo, CryptoMemory, CryptoRF, dsPIC, FlashFlex, flexPWR, HELDO, IGLOO, JukeBlox, KeeLoq, Kleer, LANCheck, LinkMD, maXStylus, maXTouch, MediaLB, megaAVR, Microsemi, Microsemi logo, MOST, MOST logo, MPLAB, OptoLyzer, PackeTime, PIC, picoPower, PICSTART, PIC32 logo, PolarFire, Prochip Designer, QTouch, SAM-BA, SenGenuity, SpyNIC, SST, SST Logo, SuperFlash, Symmetricom, SyncServer, Tachyon, TimeSource, tinyAVR, UNI/O, Vectron, and XMEGA are registered trademarks of Microchip Technology Incorporated in the U.S.A. and other countries.

AgileSwitch, APT, ClockWorks, The Embedded Control Solutions Company, EtherSynch, FlashTec, Hyper Speed Control, HyperLight Load, IntelliMOS, Libero, motorBench, mTouch, Powermite 3, Precision Edge, ProASIC, ProASIC Plus, ProASIC Plus logo, Quiet-Wire, SmartFusion, SyncWorld, Temux, TimeCesium, TimeHub, TimePictra, TimeProvider, WinPath, and ZL are registered trademarks of Microchip Technology Incorporated in the U.S.A.

Adjacent Key Suppression, AKS, Analog-for-the-Digital Age, Any Capacitor, Anyln, AnyOut, Augmented Switching, BlueSky, BodyCom, CodeGuard, CryptoAuthentication, CryptoAutomotive, CryptoCompanion, CryptoController, dsPICDEM, dsPICDEM.net, Dynamic Average Matching, DAM, ECAN, Espresso T1S, EtherGREEN, IdealBridge, In-Circuit Serial Programming, ICSP, INICnet, Intelligent Paralleling, Inter-Chip Connectivity, JitterBlocker, maxCrypto, maxView, memBrain, Mindi, MiWi, MPASM, MPF, MPLAB Certified logo, MPLIB, MPLINK, MultiTRAK, NetDetach, Omniscient Code Generation, PICDEM, PICDEM.net, PICkit, PICtail, PowerSmart, PureSilicon, QMatrix, REAL ICE, Ripple Blocker, RTAX, RTG4, SAM-ICE, Serial Quad I/O, simpleMAP, SimpliPHY, SmartBuffer, SMART-I.S., storClad, SQI, SuperSwitcher, SuperSwitcher II, Switchtec, SynchroPHY, Total Endurance, TSHARC, USBCheck, VariSense, VectorBlox, VeriPHY, ViewSpan, WiperLock, XpressConnect, and ZENA are trademarks of Microchip Technology Incorporated in the U.S.A. and other countries.

SQTP is a service mark of Microchip Technology Incorporated in the U.S.A.
The Adaptec logo, Frequency on Demand, Silicon Storage Technology, and Symmcom are registered trademarks of Microchip Technology Inc. in other countries.
GestIC is a registered trademark of Microchip Technology Germany II GmbH \& Co. KG, a subsidiary of Microchip Technology Inc., in other countries.
All other trademarks mentioned herein are property of their respective companies.
