## Single Bit Uni-Directional Translator

## FXLP34

## Description

The FXLP34 is a single translator with two separate supply voltages: $\mathrm{V}_{\mathrm{CC} 1}$ for input translation voltages and $\mathrm{V}_{\mathrm{CC}}$ for output translation voltages. The FXLP34 is part of onsemi's Ultra Low Power (ULP) series of products. This device operates with VCC values from 1.0 V to 3.6 V , and is intended for use in portable applications that require ultra low power consumption.

The internal circuit is composed of a minimum of buffer stages, to enable ultra low dynamic power.

The FXLP34 is uniquely designed for optimized power and speed, and is fabricated with an advanced CMOS technology to achieve high-speed operation while maintaining low CMOS power dissipation.

## Features

- 1.0 V to 3.6 V V CC Supply Voltage
- Converts Any Voltage (1.0 V to 3.6 V ) to (1.0 V to 3.6 V )
- 4.6 V Tolerant Inputs and Outputs
- tpD:
- 4 ns Typical for 3.0 V to $3.6 \mathrm{~V}_{\mathrm{CC}}$
- Power-Off High Impedance Inputs and Outputs
- Static Drive $\left(\mathrm{I}_{\mathrm{OH}} / \mathrm{I}_{\mathrm{OL}}\right)$ :
- $\pm 2.6 \mathrm{~mA}$ at $3.00 \mathrm{~V} \mathrm{~V}_{\mathrm{CC}}$
- Uses Proprietary Quiet Series Noise / EMI Reduction Circuitry
- Ultra-Small MicroPak ${ }^{\text {TM }}$ Leadless Packages
- Ultra-Low Dynamic Power
- These are $\mathrm{Pb}-$ Free Devices

## Translator Power-up Sequence Recommendations

To ensure that the system does not experience unnecessary $\mathrm{I}_{\mathrm{CC}}$ current draw, bus contention, or oscillations during power-up; adhere to the following guidelines. This device is designed with the output pin(s) supplied by $\mathrm{V}_{\mathrm{CC}}$ and the input pin(s) supplied by $\mathrm{V}_{\mathrm{CC} 1}$. The first recommendation is to begin by powering up the input side of the device with $\mathrm{V}_{\mathrm{CC} 1}$. The Input pin(s) should be ramped with or ahead of $\mathrm{V}_{\mathrm{CC} 1}$ or held LOW. This guards against bus contentions and oscillations as all inputs and the
input $\mathrm{V}_{\mathrm{CC} 1}$ are powered at the same time. The output $\mathrm{V}_{\mathrm{CC}}$ can then be powered to the target voltage level to which the device will translate. The output pin(s) then translate to logic levels dictated by the output $\mathrm{V}_{\mathrm{CC}}$ levels.

Upon completion of these steps, the device can be configured for the desired operation. Following these steps helps prevent possible damage to the translator device as well as other system components
