## FXLH1T45

## Level Translator, 1-Bit Bidirectional

## Configurable Voltage Supplies and Bushold Data Inputs

The FXLH1T45 is a single bit configurable dual-voltage supply translator designed for both uni-directional and bi-directional voltage translation between two logic levels. The device allows translation between voltages as high as 3.6 V to as low as 1.1 V . The A port tracks the $\mathrm{V}_{\mathrm{CCA}}$ level, and the B port tracks the $\mathrm{V}_{\mathrm{CCB}}$ level. This allows for bi-directional voltage translation over a variety of voltage levels: 1.2 V, $1.5 \mathrm{~V}, 1.8 \mathrm{~V}, 2.5 \mathrm{~V}$ and 3.3 V.

The device remains in 3-STATE until both $\mathrm{V}_{\mathrm{CC}}$ reach active levels allowing either $\mathrm{V}_{\mathrm{CC}}$ to be powered-up first. Internal power down control circuits place the device in 3-STATE if either $\mathrm{V}_{\mathrm{CC}}$ is removed.

The Transmit/Receive ( $\mathrm{T} / \overline{\mathrm{R}}$ ) input determines the direction of data flow through the device. The FXLH1T45 is designed so that the control pin $(T / \bar{R})$ is supplied by $V_{C C A}$.

## Features

- Bi-directional Interface between any 2 Levels from 1.1 V to 3.6 V
- Fully Configurable: Inputs Track $\mathrm{V}_{\mathrm{CC}}$ level
- Non-preferential Power-up Sequencing; either $\mathrm{V}_{\mathrm{CC}}$ may be Powered-up First
- Outputs Remain in 3-STATE until Active $\mathrm{V}_{\mathrm{CC}}$ Level is Reached
- Outputs Switch to 3-STATE if either Vcc is at GND
- Power Off Protection
- Bushold On Data Inputs Eliminates the Need for External Pull-up/Pull-down Resistors
- Control Input $(\mathrm{T} / \overline{\mathrm{R}})$ Levels are Referenced to $\mathrm{V}_{\mathrm{CCA}}$ Voltage
- Packaged in the MicroPak 6 SIP6 ( $1.0 \mathrm{~mm} \times 1.45 \mathrm{~mm}$ )
- ESD Protections Exceeds:
- 4 kV HBM ESD (per JESD22-A114 \& Mil Std 883e 3015.7)
- 8 kV HBM I/O to GND ESD (per JESD22-A114 \& Mil Std 883e 3015.7)
- 1 kV CDM ESD (per ESD STM 5.3)
- 200 V MM ESD (per JESD22-A115 \& ESD STM5.2)

## POWER-UP/POWER-DOWN SEQUENCING

FXL translators offer an advantage in that either $\mathrm{V}_{\mathrm{CC}}$ may be powered up first. This benefit derives from the chip design. When either $\mathrm{V}_{\mathrm{CC}}$ is at 0 V , outputs are in a HIGH-Impedance state. To ensure that bus contention, excessive currents, or oscillations do not occur, a proper power-up sequence is recommended.
The recommended power-up sequence is the following:

1. Apply power to either $\mathrm{V}_{\mathrm{CC}}$
2. Apply power to the $\mathrm{T} / \overline{\mathrm{R}}$ input (Logic HIGH for A-to-B operation; Logic LOW for B-to-A operation) and to the respective data inputs (A Port or B Port). This may occur at the same time as Step 1
3. Apply power to other $\mathrm{V}_{\mathrm{CC}}$

The recommended power-down sequence is the following:
4. Remove power from either $\mathrm{V}_{\mathrm{CC}}$
5. Remove power from other $\mathrm{V}_{\mathrm{CC}}$

## NOTES:

8. The enable time, $\mathrm{t}_{\mathrm{PZH}}$ or $\mathrm{t}_{\text {PZL }}$, is the time for the FXLH1T45 to return to active operation after a direction change. The enable time specifies the worst-case delay from the time the $T / R$ pin is switched until a valid output signal is expected. For example, to change direction to $B-t o-A$ operation, the T/R pin is switched from HIGH-to-LOW. The enable time for this case is found by adding the disable time for $T / R$ to $B$ to the propagation delay for $B$ to $A$. The formulas for calculating enable times are the following:
$t_{P Z H}(T / \bar{R}$ to $A)=t_{P L Z}(T / R$ to $B)+t_{P L H}(B$ to $A)$
$t_{P Z L}(T / \bar{R}$ to $A)=t_{P H Z}(T / \bar{R}$ to $B)+t_{P H L}(B$ to $A)$
$t_{P Z H}(T / \bar{R}$ to $B)=t_{P L Z}(T / \bar{R}$ to $A)+t_{P L H}(A$ to $B)$
$t_{P Z L}(T / R$ to $B)=t_{P H Z}(T / R$ to $A)+t_{P H L}(A$ to $B)$
