## Push－Pull Output Sub－Microamp Comparators

## Description

The Microchip Technology Inc．HT6541／2／3／4 family of comparators is offered in single（HT6541），single with chip select （HT6543），dual（HT6542）and quad（HT6544）configurations．The outputs are push－pull（CMOS／TTL－compatible）and are capable of driving heavy DC or capacitive loads．These comparators are optimized for low power，single－supply operation with greater than rail－to－rail input operation．The push－pull output of the HT6541／2／3／4 family supports rail－to－rail output swing and interfaces with TTL／CMOS logic．The internal input hysteresis eliminates output switching due to internal input noise voltage， reducing current draw．The output limits supply current surges and dynamic power consumption while switching．This product family operates with a single－supply voltage as low as 1.6 V and draws less than $1 \mu \mathrm{~A} /$ comparator of quiescent current．The related HT6546／7／8／9 family of comparators from Microchip has an open－drain output．Used with a pull－up resistor， these devices can be used as level－shifters for any desired voltage up to 10 V and in wired－OR logic．

## Features

－Low Quiescent Current： $600 \mathrm{nA} /$ comparator（typ．）
－Rail－to－Rail Input： $\mathrm{V}_{\mathrm{SS}}-0.3 \mathrm{~V}$ to $\mathrm{V}_{\mathrm{DD}}+0.3 \mathrm{~V}$
－CMOS／TTL－Compatible Output
－Propagation Delay $4 \mu \mathrm{~s}$（typ．）
－Wide Supply Voltage Range： 1.6 V to 5.5 V
－Available in Single，Dual and Quad
－Single available in SOT－23－5，SC－70－5 packages
－Chip Select（CS）with HT6543
－Low Switching Current
－Internal Hysteresis： 3.3 mV （typ．）
－Industrial Temperature：$-40^{\circ} \mathrm{C}$ to $+85^{\circ} \mathrm{C}$

## Typical Applications

－Laptop Computers
－Mobile Phones
－Metering Systems
－Hand－held Electronics
－RC Timers
－Alarm and Monitoring Circuits
－Windowed Comparators
－Multi－vibrators

## Related Devices

－Open－Drain Output：HT6546／7／8／9

## 3．1 APPLICATIONS INFORMATION

The HT6541／2／3／4 family of push－pull output compar－ ators are fabricated on Microchip＇s state－of－the－art CMOS process．They are suitable for a wide range of applications requiring very low power consumption．

## 3．2 Comparator Inputs

The HT6541／2／3／4 comparator family uses CMOS transistors at the input．They are designed to prevent phase inversion when the input pins exceed the supply voltages．Figure 2－31 shows an input voltage exceeding both supplies with no resulting phase inversion．
The input stage of this family of devices uses two differential input stages in parallel：one operates at low inputvoltages andtheother athigh input voltages．With this topology，the input voltage is 0.3 V above $\mathrm{V}_{\mathrm{DD}}$ and 0.3 V below $\mathrm{V}_{\mathrm{SS}}$ ．Therefore，the input offset voltage is measured at both $\mathrm{V}_{S S}-0.3 \mathrm{~V}$ and $\mathrm{V}_{\mathrm{DD}}+0.3 \mathrm{~V}$ to ensure proper operation．
The maximum operating input voltages that can be applied are $\mathrm{V}_{\mathrm{SS}}-0.3 \mathrm{~V}$ and $\mathrm{V}_{\mathrm{DD}}+0.3 \mathrm{~V}$ ．Voltages on the inputs that exceed this absolute maximum rating can cause excessive current to flow and permanently damage the device．In applications where the input pin exceeds the specified range，external resistors can be used to limit the current below $\pm 2 \mathrm{~mA}$ ，as shown in Figure 3－1．

FIGURE 3－1：An input resistor（ $R_{I N}$ ） should be used to limit excessive input current if either of the inputs exceeds the Absolute Maximum specification．

## 3．3 Push－Pull Output

The push－pull output is designed to be compatible with CMOS and TTL logic，while the output transistors are configured to give rail－to－rail output performance．They are driven with circuitry that minimizes any switching current（shoot－through current from supply－to－supply） when the output is transitioned from high－to－low，or from low－to－high（see Figures 2－15，2－17，2－32 through 2－36 for more information）．

## 3．4 HT6543 Chip Select（CS）

The HT6543 is a single comparator with chip select （CS）．When $\overline{\mathrm{CS}}$ is pulled high，the total current consumption drops to 20 pA （typ）； 1 pA （typ）flows through the CS pin， 1 pA（typ）flows through the output pin and 18 pA （typ）flows through the $\mathrm{V}_{\mathrm{DD}}$ pin，as shown in Figure 1－1．When this happens，the comparator output is put into a high－impedance state． By pulling CS low，the comparator is enabled．If the CS pin is left floating，the comparator will not operate properly．Figure 1－1 shows the output voltage and supply current response to a CS pulse．
The internal $\overline{C S}$ circuitry is designed to minimize glitches when cycling the CS pin．This helps conserve power，which is especially important in battery－ powered applications．

## 3．5 Externally－Set Hysteresis

Greater flexibility in selecting hysteresis（or input trip points）is achieved by using external resistors．
Input offset voltage（ $\mathrm{V}_{\mathrm{OS}}$ ）is the center（average）of the （input－referred）low－high and high－low trip points．Input hysteresis voltage（ $\mathrm{V}_{\text {HYST }}$ ）is the difference between the same trip points．Hysteresis reduces output chattering when one input is slowly moving past the other and thus reduces dynamic supply current．It also helps in systems where it is best not to cycle between states too frequently（e．g．，air conditioner thermostatic control）．The HT6541／2／3／4 family has internally－set hysteresis that is small enough to maintain input offset accuracy（ $<7 \mathrm{mV}$ ）and large enough to eliminate output chattering caused by the comparator＇s own input noise voltage（ $200 \mu \mathrm{~V} p-\mathrm{p}$ ）．

FIGURE 3－2：$\quad$ The HT6541／2／3／4 comparators＇internal hysteresis eliminates outputchattercaused by input noise voltage．

## 3．5．1 NON－INVERTING CIRCUIT

Figure 3－3 shows a non－inverting circuit for single－ supply applications using just two resistors．The resulting hysteresis diagram is shown in Figure 3－4．

FIGURE 3－3：Non－inverting circuit with hysteresis for single－supply．

FIGURE 3－4：Hysteresis Diagram for the Non－Inverting Circuit．

The trip points for Figures 3－3 and 3－4 are：

## EQUATION

$V_{T L H}=V_{R E F}\left(1+\frac{R_{1}}{R_{F}}\right)-V_{O L}\left(\frac{R_{1}}{R_{F}}\right)$
$V_{T H L}=V_{R E F}\left(1+\frac{R_{1}}{R_{F}}\right)-V_{O H}\left(\frac{R_{1}}{R_{F}}\right)$
$V_{T L H}=$ trip voltage from low to high
$V_{T H L}=$ trip voltage from high to low
$V_{T L H}=$ trip voltage from low to high
$V_{T H L}=$ trip voltage from high to low

## 3．5．2 INVERTING CIRCUIT

Figure 3－5 shows an inverting circuit for single－supply using three resistors．The resulting hysteresis diagram is shown in Figure 3－6．

FIGURE 3－5：Inverting Circuit With
Hysteresis．

FIGURE 3－6：
Hysteresis Diagram for the Inverting Circuit．

In order to determine the trip voltages $\left(\mathrm{V}_{\mathrm{THL}}\right.$ and $\left.\mathrm{V}_{\mathrm{TLH}}\right)$ for the circuit shown in Figure $3-5, R_{2}$ and $R_{3}$ can be simplified to the Thevenin equivalent circuit with respect to $V_{D D}$ ，as shown in Figure 3－7．

FIGURE 3－7：
Thevenin Equivalent Circuit．

Where：

$$
\begin{gathered}
R_{23}=\frac{R_{2} R_{3}}{R_{2}+R_{3}} \\
V_{23}=\frac{R_{3}}{R_{2}+R_{3}} \times V_{D D}
\end{gathered}
$$

Using this simplified circuit，the trip voltage can be calculated using the following equation：

## EQUATION

$$
\begin{aligned}
& V_{T H L}=V_{O H}\left(\frac{R_{23}}{R_{23}+R_{F}}\right)+V_{23}\left(\frac{R_{F}}{R_{23}+R_{F}}\right) \\
& V_{T I . H}=V_{O I}\left(\frac{R_{23}}{R_{23}+R_{F}}\right)+V_{23}\left(\frac{R_{F}}{R_{23}+R_{F}}\right)
\end{aligned}
$$

$V_{T L H}=$ trip voltage from low to high
$V_{T H L}=$ trip voltage from high to low

Figure 2－19 and Figure 2－22 can be used to determine typical values for $\mathrm{V}_{\mathrm{OH}}$ and $\mathrm{V}_{\mathrm{OL}}$ ．

## 3．5 Bypass Capacitors

With this family of comparators，the power supply pin （ $\mathrm{V}_{\mathrm{DD}}$ for single supply）should have a local bypass capacitor（i．e．， $0.01 \mu \mathrm{~F}$ to $0.1 \mu \mathrm{~F}$ ）within 2 mm for good edge rateperformance．

## 3．6 Capacitive Loads

Reasonable capacitive loads（e．g．，logic gates）have little impact on propagation delay（see Figure 2－27）． The supply current increases with increasing toggle frequency（Figure 2－30），especially with higher capacitive loads．

## 3．7 Battery Life

In order to maximize battery life in portable applications，use large resistors and small capacitive loads．Also，avoid toggling the output more than necessary and do not use chip select（CS）to conserve power for short periods of time．Capacitive loads will draw additional power at start－up．

## 3．8 PCB Surface Leakage

In applications where low input bias current is critical， PCB（Printed Circuit Board）surface leakage effects need to be considered．Surface leakage is caused by humidity，dust or other contamination on the board． Under low humidity conditions，a typical resistance between nearby traces is $10^{12} \Omega$ ．A 5 V difference would cause 5 pA ，if current－to－flow．This is greater than the HT6541／2／3／4 family＇s bias current at $25^{\circ} \mathrm{C}$（ 1 pA ， typ）．

The easiest way to reduce surface leakage is to use a guard ring around sensitive pins（or traces）．The guard ring is biased at the same voltage as the sensitive pin． An example of this type of layout is shown in Figure 3－8．

FIGURE 3－8：Example Guard Ring Layout for Inverting Circuit．
1．Inverting Configuration（Figures 3－5 and 3－8）：
a．Connect the guard ring to the non－inverting input pin $\left(\mathrm{V}_{\mathrm{IN}^{+}}\right)$．This biases the guard ring to the same reference voltage as the comparator（e．g．， $\mathrm{V}_{\mathrm{DD}} / 2$ or ground）．
b．Connect the inverting pin（ $\mathrm{V}_{\mathbb{I N}^{-}}$）to the input pad without touching the guard ring．
2．Non－inverting Configuration（Figure 3－3）：
a．Connect the non－inverting pin（ $\mathrm{V}_{\mathrm{IN}^{+}}$）to the input pad without touching the guard ring．
b．Connect the guard ring to the inverting input pin $\left(\mathrm{V}_{\mathrm{IN}^{-}}\right)$．

## 3．9 Typical Applications

## 3．9．1 PRECISE COMPARATOR

Some applications require higher DC precision．An easy way to solve this problem is to use an amplifier （such as the HT6041）to gain－up the input signal before it reaches the comparator．Figure 3－9 shows an example of this approach．

FIGURE3－9：Precise Inverting
Comparator．

## 3．9．2 WINDOWED COMPARATOR

Figure $3-10$ shows one approach to designing a win－ dowed comparator．The AND gate produces a logic＇ 1 ＇ when the input voltage is between $\mathrm{V}_{\mathrm{RB}}$ and $\mathrm{V}_{\mathrm{RT}}$（where $\mathrm{V}_{\mathrm{RT}}>\mathrm{V}_{\mathrm{RB}}$ ）．

FIGURE 3－10：Windowed Comparator．

## 3．9．3 BISTABLE MULTI－VIBRATOR

A simple bistable multi－vibrator design is shown in Figure 3－11． $\mathrm{V}_{\text {REF }}$ needs to be between the power supplies（ $\mathrm{V}_{\mathrm{SS}}=\mathrm{GND}$ and $\mathrm{V}_{\mathrm{DD}}$ ）to achieve oscillation． The output duty cycle changes with $\mathrm{V}_{\mathrm{REF}}$ ．

FIGURE 3－11：Bistable Multi－vibrator．
