Community

## UCCx895 BiCMOS 高级相移 PWM 控制器

1 特性

- 可编程输出接通延迟
- 自适应延迟设置
- 双向振荡器同步
- 电压模式，峰值电流模式或平均电流模式控制
- 通过单个引脚实现可编程的软启动，软停止和芯片禁用
- $0 \%$ 至 $100 \%$ 占空比控制
- 7MHz 误差放大器
- 工作频率高达 1 MHz
- 500 kHz 下典型工作电流为 5 mA
- UVLO 期间具有 $150 \mu \mathrm{~A}$ 的极低工作电流

2 应用

- 相移全桥转换器
- 离线，电信，数据通信和服务器
- 分布式电源架构
- 高密度电源模块

## 3 说明

UCC3895 是一款相移 PWM 控制器，它通过相移切换一个半桥相对于另一半桥来实现对全桥功率级的控制。该器件支持恒定频率脉冲宽度调制和谐振零电压开关，可在高频下提供高效率。该器件既可用作电压模式控制器，也可用作电流模式控制器。

UCC3895 在保留了 UC3875／6／7／8 系列和 UC3879 的功能的同时，还改进了该控制器系列，使其具有增强的控制逻辑，自适应延迟设置和关断功能等附加功能。由于该器件采用 BCDMOS 工艺制造，因此与双极型同类器件相比，它的工作电流要小得多。UCC3895的最大时钟频率为 1 MHz 。

| 器件信息（1） |  |  |
| :--- | :--- | :--- |
| 器件型号 | 封装 | 封装尺寸（标称值） |
|  | CDIP $(20)$ | $24.20 \mathrm{~mm} \times 6.92 \mathrm{~mm}$ |
|  | LCCC $(20$ | $8.89 \mathrm{~mm} \times 8.89 \mathrm{~mm}$ |
|  | SOIC $(20)$ | $12.80 \mathrm{~mm} \times 7.50 \mathrm{~mm}$ |
|  | PDIP $(20)$ | $24.33 \mathrm{~mm} \times 6.35 \mathrm{~mm}$ |
|  | TSSOP $(20)$ | $6.50 \mathrm{~mm} \times 4.40 \mathrm{~mm}$ |
|  | PLCC $(20)$ | $8.96 \mathrm{~mm} \times 8.96 \mathrm{~mm}$ |

（1）如需了解所有可用封装，请参阅数据表末尾的可订购产品附录。

## 4 修订历史记录

注：之前版本的页码可能与当前版本有所不同。
Changes from Revision P（June 2013）to Revision Q Page
－已添加 添加了 ESD 额定值 表，特性 说明 部分，器件功能模式，应用和实施 部分，电源相关建议 部分，布局 部 分，器件和文档支持 部分以及机械，封装和可订购信息 部分 ..... 1
－Changed UCC1895 V ..... 8
－Changed UCC1895 RAMP sink current MIN，From 12 mA ：To 10 mA in Electrical Characteristics． ..... 8
－Changed the $\mathrm{F}_{\mathrm{SW}}$ note in the Detailed Design Procedure section ..... 23
－Changed the voltage drop across the $\mathrm{R}_{\mathrm{DS}(o n)}$ from $0.5-\mathrm{V}$ to $4.5-\mathrm{V}$ forward voltage drop in the output rectifiers ..... 23
－Added Output Voltage Setpoint section． ..... 34
－Added Setting the Switching Frequency section ..... 36
－Added Soft Start section ..... 36
－Added Setting the Switching Delays section ..... 36
－Added Setting the Slope Compensation section ..... 38
Changes from Revision O（April 2010）to Revision P Page
－Added The CS input connects to text to the beginning of the CS Detailed Pin Description． ..... 14
－Added second paragraph to detailed REF Pin Description and included the UCC1895 at the end of the first paragraph to differentiate capacitance capabilities of the devices． ..... 16
－Changed UCC3895 Timing Diagram in the Application Information section to reflect the maximum duty cycle conditions ..... 19
Changes from Revision N（May 2009）to Revision O Page
－Changed REF pin description from＂Do not use more than $1.0 \mu \mathrm{~F}$ of total capacitance on this pin．＂to＂Do not use more than $4.7 \mu \mathrm{~F}$ of total capacitance on this pin．＂ ..... 16

## 5 Pin Configuration and Functions

PW AND DW PACKAGE DRAWINGS (TOP VIEW)
PW and DW PACKAGE (TOP VIEW)

## N AND J PACKAGE DRAWINGS (TOP VIEW)

## Pin Functions

| PIN |  | I/O | DESCRIPTION |
| :---: | :---: | :---: | :---: |
| NAME | NO. |  |  |
| ADS | 11 | I | The adaptive-delay-set pin sets the ratio between the maximum and minimum programmed output delay dead time. |
| CS | 12 | 1 | Current sense input for cycle-by-cycle current limiting and for over-current comparator. |
| CT | 7 | I | Oscillator timing capacitor for programming the switching frequency. The UCC3895 oscillator charges CT via a programmed current. |
| DELAB | 9 | I | The delay-programming between complementary-outputs pin, DELAB, programs the dead time between switching of output A and output B. |
| DELCD | 10 | I | The delay-programming between complementary-outputs pin, DELCD, programs the dead time between switching of output C and output D. |
| EAOUT | 2 | I/O | Error amplifier output. |
| EAP | 20 | I | Non-inverting input to the error amplifier. Keep below 3.6 V for proper operation. |
| EAN | 1 | 1 | Inverting input to the error amplifier. Keep below 3.6 V for proper operation. |
| GND | 5 | - | Chip ground for all circuits except the output stages. |
| OUTA | 18 | O | The four outputs are $100-\mathrm{mA}$ complementary MOS drivers, and are optimized to drive FET driver circuits such as UCC27714 or gate drive transformers. |
| OUTB | 17 | O |  |
| OUTC | 14 | O |  |
| OUTD | 13 | 0 |  |
| PGND | 16 | - | Output stage ground. |
| RAMP | 3 | I | Inverting input of the PWM comparator. |
| REF | 4 | O | $5-\mathrm{V}, \pm 1.2 \%, 5-\mathrm{mA}$ voltage reference. For best performance, bypass with a $0.1-\mu \mathrm{F}$ low ESR, low ESL capacitor to ground. Do not use more than $4.7 \mu \mathrm{~F}$ of total capacitance on this pin. |
| RT | 8 | I | Oscillator timing resistor for programming the switching frequency. |
| SS/DISB | 19 | 1 | Soft-start and disable pin which combines the two independent functions. |
| SYNC | 6 | I/O | The oscillator synchronization pin is bidirectional. |
| VDD | 15 | I | The power supply input pin, VDD, must be bypassed with a minimum of a $1-\mu$ F low ESR, low ESL capacitor to ground. The addition of a $10-\mu \mathrm{F}$ low ESR, low ESL between VDD and PGND is recommended. |

## 6 Specifications

### 6.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted) ${ }^{(1)}$

|  |  | MIN | MAX | UNIT |
| :---: | :---: | :---: | :---: | :---: |
| Supply voltage |  |  | 17 | V |
| Output current |  |  | 100 | mA |
| Reference current |  |  | 15 | mA |
| Supply current |  |  | 30 | mA |
| Analog inputs | EAP, EAN, EAOUT, RAMP, SYNC, ADS, CS, SS/DISB | -0.3 | REF + 0.3 | V |
| Drive outputs | OUTA, OUTB, OUTC, OUTD | -0.3 | $\mathrm{VCC}+0.3$ | V |
| Power dissipation at $\mathrm{T}_{\mathrm{A}}=25^{\circ} \mathrm{C}$ | DW-20 package |  | 650 | mW |
|  | N-20 package |  | 1 | W |
| Junction temperature |  | -55 | 150 | ${ }^{\circ} \mathrm{C}$ |
| Storage temperature |  | -65 | 150 | ${ }^{\circ} \mathrm{C}$ |

(1) Stresses beyond those listed under Absolute Maximum Ratings may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under Recommended Operating Conditions. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

### 6.2 ESD Ratings

|  |  |  | VALUE | UNIT |
| :---: | :---: | :---: | :---: | :---: |
|  |  | Human-body model (HBM), per ANSI/ESDA/JEDEC JS-001 ${ }^{(1)}$ | $\pm 1000$ | V |
| D) | Electrostatic discharge | Charged-device model (CDM), per JEDEC specification JESD22-C101 ${ }^{(2)}$ | $\pm 1000$ | V |

(1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.
(2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

### 6.3 Recommended Operating Conditions

over operating free-air temperature range (unless otherwise noted) ${ }^{(1)}$

|  |  | MIN | NOM | MAX | UNIT |
| :---: | :---: | :---: | :---: | :---: | :---: |
| $V_{D D}$ | Supply voltage | 10 |  | 16.5 | V |
| $V_{D D}$ | Supply voltage bypass capacitor ${ }^{(2)}$ | $10 \times \mathrm{C}_{\text {REF }}$ |  |  | $\mu \mathrm{F}$ |
| $\mathrm{C}_{\text {REF }}$ | Reference bypass capacitor (UCC1895) ${ }^{(3)}$ | 0.1 |  | 1 | $\mu \mathrm{F}$ |
| $\mathrm{C}_{\text {REF }}$ | Reference bypass capacitor (UCC2895, UCC3895) ${ }^{(3)}$ | 0.1 |  | 4.7 | $\mu \mathrm{F}$ |
| $\mathrm{C}_{\text {T }}$ | Timing capacitor (for $500-\mathrm{kHz}$ switching frequency) |  | 220 |  | pF |
| $\mathrm{R}_{\mathrm{T}}$ | Timing resistor (for $500-\mathrm{kHz}$ switching frequency) |  | 82 |  | $\mathrm{k} \Omega$ |
| $\mathrm{R}_{\text {DEL_AB }}, \mathrm{R}_{\mathrm{DEL} \text { _CD }}$ | Delay resistor | 2.5 |  | 40 | $\mathrm{k} \Omega$ |
| $\mathrm{T}_{J}$ | Operating junction temperature ${ }^{(4)}$ | -55 |  | 125 | ${ }^{\circ} \mathrm{C}$ |

(1) TI recommends that there be a single point grounded between GND and PGND directly under the device. There must be a separate ground plane associated with the GND pin and all components associated with pins 1 through 12, plus 19 and 20, be located over this ground plane. Any connections associated with these pins to ground must be connected to this ground plane.
(2) The $V_{D D}$ capacitor must be a low ESR, ESL ceramic capacitor located directly across the VDD and PGND pins. A larger bulk capacitor must be located as physically close as possible to the $\mathrm{V}_{\mathrm{DD}}$ pins.
(3) The $V_{\text {REF }}$ capacitor must be a low ESR, ESL ceramic capacitor located directly across the REF and GND pins. If a larger capacitor is desired for the $V_{\text {REF }}$ then it must be located near the $V_{\text {REF }}$ cap and connected to the $V_{\text {REF }}$ pin with a resistor of $51 \Omega$ or greater. The bulk capacitor on $V_{D D}$ must be a factor of 10 greater than the total $V_{\text {REF }}$ capacitance.
(4) Tl does not recommended that the device operate under conditions beyond those specified in this table for extended periods of time.

(3) Minimum phase shift is defined as:
$\Phi=180 \times \frac{\mathrm{t}_{\mathrm{f} \text { (OUTC) }}-\mathrm{t}_{\mathrm{f} \text { (OUTA) }}}{t_{\text {PERIOD }}}$ or $\Phi=180 \times \frac{\mathrm{t}_{\mathrm{f} \text { (OUTC) }}-\mathrm{t}_{\mathrm{f} \text { (OUTB) }}}{t_{\text {PERIOD }}}$
where
(a) $\mathrm{t}_{\text {(OUTA) }}=$ falling edge of OUTA signal
(b) $\mathrm{t}_{\mathrm{f}}$ (ОUTB) $=$ falling edge of OUTB signal
(c) $\mathrm{t}_{\text {(OUTC) }}=$ falling edge of OUTC signal
(d) $\mathrm{t}_{\mathrm{f}}$ OUTD) $=$ falling edge of OUTD signal
(e) t $_{\text {PERIOD }}=$ period of OUTA or OUTB signal

## 7 Detailed Description

### 7.1 Overview

The UCC3895 device combines all the functions necessary to control a phase-shifted full bridge power stage in a 20 -pin package. It includes all the outputs needed to drive the four switches in the full-bridge circuit. The dead times between the upper and lower switches in the full bridge may be set using the DELAB and DELCD inputs. Further, this dead time may be dynamically adjusted according to the load level using the ADS pin allowing the user to optimize the dead time for their particular power circuit and to achieve ZVS over the entire operating range. At light loads a no-load comparator forces cycle skipping to maintain output voltage regulation. At higherpower levels, two or more UCC3895 devices may be easily synchronized for parallel operation. The SS/DISB input may be used to set the length of the soft-start process and to turn the controller on and off. The controller may be used in Voltage mode or Current mode control and cycle-by-cycle current limiting is provided in both modes. The switching frequency may be set over a wide range making this device suited to both IGBT and MOSFET based designs.

## Functional Block Diagrams (continued)

Figure 13. Delay Block Diagram (One Delay Block Per Outlet)

### 7.3 Feature Description

### 7.3.1 ADS (Adaptive Delay Set)

This function sets the ratio between the maximum and minimum programmed output-delay dead time. When the ADS pin is directly connected to the CS pin, no delay modulation occurs. The maximum delay modulation occurs when ADS is grounded. In this case, delay time is four-times longer when CS $=0$ than when $\mathrm{CS}=2 \mathrm{~V}$ (the peakcurrent threshold), ADS changes the output voltage on the delay pins DELAB and DELCD by Equation 1.
$V_{D E L}=\left[0.75 \times\left(\mathrm{V}_{\mathrm{CS}}-\mathrm{V}_{\mathrm{ADS}}\right)\right]+0.5 \mathrm{~V}$
where

$$
\begin{equation*}
\text { - } \quad V_{C S} \text { and } V_{A D S} \text { are in volts } \tag{1}
\end{equation*}
$$

ADS must be limited to between 0 V and 2.5 V and must be less-than or equal-to CS . DELAB and DELCD are clamped to a minimum of 0.5 V .

### 7.3.2 CS (Current Sense)

The CS input connects to the inverting input of the current-sense comparator and the non-inverting input of the overcurrent comparator and the ADS amplifier. The current sense signal is used for cycle-by-cycle current limiting in peak current-mode control, and for overcurrent protection in all cases with a secondary threshold for output shutdown. An output disable initiated by an overcurrent fault also results in a restart cycle, called soft stop, with full soft start.

### 7.3.3 CT (Oscillator Timing Capacitor)

The UCC3895 oscillator charges CT via a programmed current. The waveform on $\mathrm{C}_{\mathrm{T}}$ is a sawtooth, with a peak voltage of 2.35 V . The approximate oscillator period is calculated by Equation 2.
$\mathrm{t}_{\mathrm{OSC}}=\frac{5 \times \mathrm{R}_{\mathrm{T}} \times \mathrm{C}_{\mathrm{T}}}{48}+120 \mathrm{~ns}$
where

- $\mathrm{C}_{\mathrm{T}}$ is in Farads
- $R_{T}$ is in Ohms
- $\mathrm{t}_{\mathrm{osc}}$ is in seconds
- $\mathrm{C}_{\mathrm{T}}$ can range from 100 to 880 pF

## Feature Description (continued)

## NOTE

A large $C_{T}$ and a small $R_{T}$ combination results in extended fall times on the $C_{T}$ waveform. The increased fall time increases the SYNC pulse width, hence limiting the maximum phase shift between OUTA, OUTB and OUTC, OUTD outputs, which limits the maximum duty cycle of the converter (see Figure 11).

### 7.3.4 DELAB and DELCD (Delay Programming Between Complementary Outputs)

DELAB programs the dead time between switching of OUTA and OUTB. DELCD programs the dead time between OUTC and OUTD. This delay is introduced between complementary outputs in the same leg of the external bridge. The UCC3895 allows the user to select the delay, in which the resonant switching of the external power stages takes place. Separate delays are provided for the two half-bridges to accommodate differences in resonant-capacitor charging currents. The delay in each stage is set according to Equation 3.

$$
\mathrm{t}_{\mathrm{DELAY}}=\frac{\left(25 \times 10^{-12}\right) \times \mathrm{R}_{\mathrm{DEL}}}{V_{\mathrm{DEL}}}+25 \mathrm{~ns}
$$

where

- $V_{D E L}$ is in volts
- $R_{\text {DeL }}$ is in Ohms
- $t_{\text {deLar }}$ is in seconds

DELAB and DELCD source about $1-\mathrm{mA}$ maximum. Choose the delay resistors so that this maximum is not exceeded. Programmable output delay is defeated by tying DELAB and, or, DELCD to REF. For an optimum performance keep stray capacitance on these pins at less than 10 pF .

### 7.3.5 EAOUT, EAP, and EAN (Error Amplifier)

EAOUT connects internally to the non-inverting input of the PWM comparator and the no-load comparator. EAOUT is internally clamped to the soft-start voltage. The no-load comparator shuts down the output stages when EAOUT falls below 500 mV , and allows the outputs to turn on again when EAOUT rises above 600 mV .
EAP is the non-inverting and the EAN is the inverting input to the error amplifier.

### 7.3.6 OUTA, OUTB, OUTC, and OUTD (Output MOSFET Drivers)

The four outputs are $100-\mathrm{mA}$ complementary MOS drivers, and are optimized to drive MOSFET driver circuits. OUTA and OUTB are fully complementary, (assuming no programming delay) and operate near $50 \%$ duty cycle and one-half the oscillator frequency. OUTA and OUTB are intended to drive one half-bridge circuit in an external power stage. OUTC and OUTD drive the other half-bridge and have the same characteristics as OUTA and OUTB. OUTC is phase shifted with respect to OUTA, and OUTD is phase shifted with respect to OUTB.

## NOTE

Changing the phase relationship of OUTC and OUTD with respect to OUTA and OUTB requires other than the nominal $50 \%$ duty ratio on OUTC and OUTD during those transients.

### 7.3.7 PGND (Power Ground)

To keep output switching noise from critical analog circuits, the UCC3895 has two different ground connections. PGND is the ground connection for the high-current output stages. Both GND and PGND must be electrically tied together. Also, because PGND carries high current, board traces must be low impedance.

### 7.3.8 RAMP (Inverting Input of the PWM Comparator)

This pin receives either the $\mathrm{C}_{T}$ waveform in voltage and average current-mode controls, or the current signal (plus slope compensation) in peak current-mode control.

## Feature Description (continued)

### 7.3.9 REF (Voltage Reference)

The $5-\mathrm{V} \pm 1.2 \%$ reference supplies power to internal circuitry, and also supplies up to 5 mA to external loads. The reference is shutdown during undervoltage lockout but is operational during all other disable modes. For best performance, bypass with a $0.1-\mu \mathrm{F}$ low-ESR low-ESL capacitor to GND. To ensure the stability of the internal reference, do not use more than $1 \mu \mathrm{~F}$ of total capacitance on this pin for the UCC1895.
For the UCC2895 and the UCC3895, this capacitance increases as per the limits defined in the Recommended Operating Conditions of this specification.

### 7.3.10 RT (Oscillator Timing Resistor)

The oscillator in the UCC3895 operates by charging an external timing capacitor, $\mathrm{C}_{\mathrm{T}}$, with a fixed current programmed by $R_{T}$. $R_{T}$ current is calculated with Equation 4.

$$
\begin{equation*}
\mathrm{I}_{\mathrm{RT}}(\mathrm{~A})=\frac{3 \mathrm{~V}}{\mathrm{R}_{\mathrm{T}}(\Omega)} \tag{4}
\end{equation*}
$$

$\mathrm{R}_{\mathrm{T}}$ ranges from $40 \mathrm{k} \Omega$ to $120 \mathrm{k} \Omega$. Soft-start charging and discharging currents are also programmed by $\mathrm{I}_{\mathrm{RT}}$ (Refer to Figure 11).

### 7.3.11 GND (Analog Ground)

This pin is the chip ground for all internal circuits except the output stages.

### 7.3.12 SS/DISB (Soft Start/Disable)

This pin combines two independent functions.
Disable Mode: A rapid shutdown of the chip is accomplished by externally forcing SS/DISB below 0.5 V , externally forcing REF below 4 V , or if VDD drops below the undervoltage lockout threshold. In the case of REF being pulled below 4 V or an undervoltage condition, SS/DISB is actively pulled to ground via an internal MOSFET switch.

If an overcurrent fault is sensed (CS = 2.5 V ), a soft stop is initiated. In this mode, SS/DISB sinks a constant current of $\left(10 \times I_{\mathrm{RT}}\right)$. The soft stop continues until SS/DISB falls below 0.5 V . When any of these faults are detected, all outputs are forced to ground immediately.

## NOTE

If SS/DISB is forced below 0.5 V , the pin starts to source current equal to $\mathrm{I}_{\text {RT }}$. The only time the part switches into low $\mathrm{l}_{\mathrm{DD}}$ current mode, though, is when the part is in undervoltage lockout.

Soft Start Mode: After a fault or disable condition has passed, VDD is above the start threshold, and, or, SS/DISB falls below 0.5 V during a soft stop, SS/DISB switches to a soft-start mode. The pin then sources current, equal to $I_{\text {RT }}$. A user-selected resistor/capacitor combination on SS/DISB determines the soft-start time constant.

## NOTE

SS/DISB actively clamps the EAOUT pin voltage to approximately the SS/DISB pin voltage during soft-start, soft-stop, and disable conditions.

## Feature Description (continued)

### 7.3.13 SYNC (Oscillator Synchronization)

This pin is bidirectional (refer to Figure 11). When used as an output, SYNC is used as a clock, which is the same as the internal clock of the device. When used as an input, SYNC overrides the internal oscillator of the chip and acts as the clock signal. This bidirectional feature allows synchronization of multiple power supplies. Also, the SYNC signal internally discharge the $\mathrm{C}_{\mathrm{T}}$ capacitor and any filter capacitors that are present on the RAMP pin. The internal SYNC circuitry is level sensitive, with an input-low threshold of 1.9 V , and an input-high threshold of 2.1 V . A resistor as small as $3.9 \mathrm{k} \Omega$ may be tied between SYNC and GND to reduce the sync pulse width.

### 7.3.14 VDD (Chip Supply)

This is the input pin to the chip. VDD must be bypassed with a minimum of $1-\mu \mathrm{F}$ low ESR, low ESL capacitor to ground. The addition of a $10-\mu \mathrm{F}$ low ESR, low ESL between VDD and PGND is recommended.

### 7.4 Device Functional Modes

The UCC3895 has a number of operational modes. These modes are described in detail in Feature Description section.

- Current mode - The UCC3895 device may be operated in current mode control. The CS pin is connected to the current sense signal plus slope compensation. The RAMP pin is connected to the CS pin.
- Voltage mode - The UCC3895 may be operated in voltage mode control. The RAMP pin is connected to the signal at CT.
- Light load mode - Under light load conditions the signal at the EAOUT pin can fall below the threshold of the No-Load-Comparator. When this happens the UCC3895 maintains output regulation by skipping cycles.
- Synchronized mode - Multiple UC3895 devices may be synchronised to each other or to an external clock signal.
- Disable mode - The device will stop if the EN/DISB pin is pulled below 0.5 V .
- Soft-start mode - This mode protects the power stage from excessive stresses during the start-up process.

### 7.5 Programming

### 7.5.1 Programming DELAB, DELCD and the Adaptive Delay Set

The UCC3895 allows the user to set the delay between switch commands within each leg of the full-bridge power circuit according to Equation 5.

$$
\begin{equation*}
\mathrm{t}_{\mathrm{DELAY}}=\frac{\left(25 \times 10^{-12}\right) \times \mathrm{R}_{\mathrm{DEL}}}{V_{\mathrm{DEL}}}+25 \mathrm{~ns} \tag{5}
\end{equation*}
$$

From Equation 5 VDEL is determined in conjunction with the desire to use (or not) the ADS feature from Equation 6.

$$
\begin{equation*}
V_{D E L}=\left[0.75 \times\left(V_{C S}-V_{\mathrm{ADS}}\right)\right]+0.5 \mathrm{~V} \tag{6}
\end{equation*}
$$

Figure 14 illustrates the resistors needed to program the delay periods and the ADS function.

## Programming（continued）

Figure 14．Programming Adaptive Delay Set
The ADS allows the user to vary the delay times between switch commands within each of the two legs of the converter．The delay－time modulation is implemented by connecting ADS（pin 11）to CS，GND，or a resistive divider from CS through ADS to GND to set $\mathrm{V}_{\text {ADS }}$ as shown in Figure 14．From Equation 6 for $\mathrm{V}_{\text {DEL }}$ ，if $A D S$ is tied to $G N D$ then $V_{\text {DEL }}$ rises in direct proportion to $\mathrm{V}_{\text {CS }}$ ，causing a decrease in $t_{\text {DELAY }}$ as the load increases．In this condition，the maximum value of $\mathrm{V}_{\mathrm{DEL}}$ is 2 V ．
If ADS is connected to a resistive divider between $C S$ and GND，the term（ $\mathrm{V}_{\mathrm{CS}}-\mathrm{V}_{\text {ADS }}$ ）becomes smaller， reducing the level of $\mathrm{V}_{\text {DEL．}}$ ．This reduction decreases the amount of delay modulation．In the limit of ADS tied to $\mathrm{CS}, \mathrm{V}_{\mathrm{DEL}}=0.5 \mathrm{~V}$ and no delay modulation occurs．Figure 15 graphically shows the delay time versus load for varying adaptive delay set feature voltages（ $\mathrm{V}_{\mathrm{ADS}}$ ）．
In the case of maximum delay modulation（ADS＝GND），when the circuit goes from light load to heavy load，the variation of $\mathrm{V}_{\mathrm{DEL}}$ is from 0.5 to 2 V ．This change causes the delay times to vary by a $4: 1$ ratio as the load is changed．
The ability to program an adaptive delay is a desirable feature because the optimum delay time is a function of the current flowing in the primary winding of the transformer，and changes by a factor of 10：1 or more as circuit loading changes．Reference 7 （see the 相关文档 section）describes the many interrelated factors for choosing the optimum delay times for the most efficient power conversion，and illustrates an external circuit to enable ADS using the UC3879．Implementing this adaptive feature is simplified in the UCC3895 controller，giving the user the ability to tailor the delay times to suit a particular application with a minimum of external parts．

## 8 Application and Implementation

## NOTE

Information in the following applications sections is not part of the Tl component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

### 8.1 Application Information

A simplified electrical diagram of this converter is shown in Figure 18. The controller device is located on the primary side of converter to allow easy bias power generation.
The power stage includes primary side MOSFETs, QA, QB, QC and QD. Diode rectification is used here for simplicity but synchronous rectification is also possible and is described in application notes SLUU109 Using the UCC3895 in a Direct Control Driven Synchronous Rectifier Applications and SLUA287 Control Driven Synchronous Rectifiers In Phase Shifted Full Bridge Converters. The centre-tapped rectifier scheme with L-C output filter is a popular choice for the 12-V output converters in server power supplies.
The major waveforms of the phase-shifted converter during normal operation are shown in Figure 17. The upper four waveforms show the output drive signals of the controller. Current, $I_{P R}$, is the current flowing through the primary winding of the power transformer. The bottom two waveforms show the voltage at the output inductor, $\mathrm{V}_{\text {LOUT }}$, and the current through the output inductor, I Lout. ZVS is an important feature for high input voltage converters in reducing switching losses associated with the internal parasitic capacitances of power switches and transformers. The controller ensures ZVS conditions over the entire load current range by adjusting the delay time between the primary MOSFETs switching in the same leg in accordance to the load variation. At light loads the output of the error amplifier (EAOUT) will drop below the threshold of the No-Load Comparator and the controller will enter a pulse skipping mode.

## Application Information (continued)

Figure 17. Major Waveforms of Phase-Shifted Converter

### 8.2 Typical Application

A typical application for the UCC3895 device is a controller for a phase-shifted full-bridge converter that converts a $390-\mathrm{V}_{\mathrm{DC}}$ input to a regulated $12-\mathrm{V}$ output.

Figure 18. UCC3895 Typical Application

### 8.2.1 Design Requirements

Table 1 lists the requirements for this application.

### 8.2.2 Detailed Design Procedure

The phase-shifted full-bridge converter topology is well suited to high-power server applications. This is because the phase-shifted, full-bridge converter can obtain zero-voltage switching on the primary side of the converter, reducing switching losses and EMI and increasing overall efficiency. This is a review of the design of a $600-\mathrm{W}$, phase-shifted, full-bridge converter for one of these power systems using TI's UCC3895 device. The review is based on typical values. In a production design, the values may need to be modified for worst-case conditions.

## NOTE

$\mathrm{F}_{\text {Sw }}$ refers to the switching frequency applied to the power transformer. The oscillator on the UCC2895 is set to $2 \times \mathrm{F}_{\text {sw }}$. The output inductor also experiences a switching frequency which is $2 \times \mathrm{F}_{\mathrm{Sw}}$.

### 8.2.2.1 Power Loss Budget

To meet the efficiency goal a power loss budget needs to be set.

$$
\begin{equation*}
\mathrm{P}_{\text {BUDGET }}=\mathrm{P}_{\text {OUT }} \times\left(\frac{1-\eta}{\eta}\right) \approx 52 \mathrm{~W} \tag{7}
\end{equation*}
$$

### 8.2.2.2 Preliminary Transformer Calculations (T1)

Transformer turns ratio (a1):

$$
\begin{equation*}
\mathrm{a} 1=\frac{\mathrm{N}_{\mathrm{P}}}{\mathrm{~N}_{\mathrm{S}}} \tag{8}
\end{equation*}
$$

The voltage drop across the $\mathrm{R}_{\mathrm{DS}(o n)}$ of the primary side FETs is negligible. We assume a $0.5-\mathrm{V}$ forward voltage drop in the output rectifiers.

$$
\begin{equation*}
V_{f}=0.45 \mathrm{~V} \tag{9}
\end{equation*}
$$

Select transformer turns based on $70 \%$ duty cycle ( $\mathrm{D}_{\text {MAX }}$ ) at minimum specified input voltage. This will give some room for dropout if a PFC front end is used.

$$
\begin{align*}
& \mathrm{a} 1=\frac{\mathrm{N}_{\mathrm{P}}}{\mathrm{~N}_{\mathrm{S}}}  \tag{10}\\
& \mathrm{a} 1=\frac{\mathrm{V}_{\text {INMIN }} \times \mathrm{D}_{\text {MAX }}}{\mathrm{V}_{\text {OUT }}-\mathrm{V}_{\mathrm{f}}} \approx 21 \tag{11}
\end{align*}
$$

Turns ratio rounded to the nearest whole turn.

$$
\begin{equation*}
a 1=21 \tag{12}
\end{equation*}
$$

Calculated typical duty cycle ( $\mathrm{D}_{\text {TYP }}$ ) based on average input voltage.

$$
\begin{equation*}
D_{\text {TYP }}=\frac{\left(V_{\text {OUT }}+V_{f}\right) \times a 1}{V_{\text {IN }}} \approx 0.66 \tag{13}
\end{equation*}
$$

Output inductor peak-to-peak ripple current is set to $20 \%$ of the output current.

$$
\begin{equation*}
\Delta \mathrm{L}_{\text {LOUT }}=\frac{\mathrm{P}_{\text {OUT }} \times 0.2}{\mathrm{~V}_{\text {OUT }}}=10 \mathrm{~A} \tag{14}
\end{equation*}
$$

Care must be taken in selecting the correct amount of magnetizing inductance ( $\mathrm{L}_{\mathrm{MAG}}$ ). The following equations calculate the minimum magnetizing inductance of the primary of the transformer (T1) to ensure the converter operates in current-mode control. As $\mathrm{L}_{\text {MAG }}$ reduces, the increasing magnetizing current becomes an increasing proportion of the signal at the CS pin. If the magnetizing current increases enough it can swamp out the current sense signal across $\mathrm{R}_{\mathrm{CS}}$ and the converter will operate increasingly as if it were in voltage mode control rather than current mode.

$$
\begin{equation*}
\mathrm{L}_{\text {MAG }} \geq \frac{\mathrm{V}_{\mathrm{IN}} \times\left(1-\mathrm{D}_{\mathrm{TYP}}\right)}{\frac{\Delta \mathrm{I}_{\mathrm{LOUT}} \times 0.5}{\mathrm{a} 1} \times 2 \times \mathrm{F}_{\mathrm{SW}}} \approx 2.78 \mathrm{mH} \tag{15}
\end{equation*}
$$

Figure 19 shows the transformer primary and secondary currents during normal operation.

Figure 19. T1 Primary and Secondary Currents

Calculate T 1 secondary RMS current (ISRMS $)$ :

$$
\begin{align*}
& \mathrm{I}_{\mathrm{PS}}=\frac{\mathrm{P}_{\mathrm{OUT}}}{\mathrm{~V}_{\text {OUT }}}+\frac{\Delta \mathrm{I}_{\text {LOUT }}}{2} \approx 55 \mathrm{~A}  \tag{16}\\
& \mathrm{I}_{\text {MS }}=\frac{\mathrm{P}_{\text {OUT }}}{\mathrm{V}_{\text {OUT }}}-\frac{\Delta \mathrm{I}_{\text {LOUT }}}{2} \approx 45 \mathrm{~A}  \tag{17}\\
& \mathrm{I}_{\text {MS } 2}=\mathrm{I}_{\mathrm{PS}}-\frac{\Delta \mathrm{I}_{\text {LOUT }}}{2} \approx 50 \mathrm{~A} \tag{18}
\end{align*}
$$

Secondary RMS current ( $I_{\text {SRMS1 }}$ ) when energy is being delivered to the secondary: (OUTA $=O U T D=\mathrm{HI}$ or OUTB = OUTC = HI).

$$
\begin{equation*}
\mathrm{I}_{\mathrm{SRMS} 1}=\sqrt{\left(\frac{\mathrm{D}_{\mathrm{MAX}}}{2}\right)\left[\mathrm{I}_{\mathrm{PS}} \times \mathrm{I}_{\mathrm{MS}}+\frac{\left(\mathrm{I}_{\mathrm{PS}}-I_{\mathrm{MS}}\right)^{2}}{3}\right]} \approx 29.6 \mathrm{~A} \tag{19}
\end{equation*}
$$

Secondary RMS current ( $\mathrm{I}_{\text {SRMS2 }}$ ) during freewheeling period: (OUTA $=$ OUTC $=\mathrm{HI}$ or OUTB $=$ OUTD $\left.=\mathrm{HI}\right)$.

$$
\begin{equation*}
\mathrm{I}_{\mathrm{SRMS} 2}=\sqrt{\left(\frac{1-\mathrm{D}_{\mathrm{MAX}}}{2}\right)\left[\mathrm{I}_{\mathrm{PS}} \times \mathrm{I}_{\mathrm{MS} 2}+\frac{\left(\mathrm{I}_{\mathrm{PS}}-\mathrm{I}_{\mathrm{MS} 2}\right)^{2}}{3}\right]} \approx 20.3 \mathrm{~A} \tag{20}
\end{equation*}
$$

Secondary RMS current ( $\mathrm{I}_{\text {SRMS3 }}$ ) caused by the negative current in the opposing winding during freewheeling period, please refer to Figure 19.

$$
\begin{equation*}
\mathrm{I}_{\mathrm{SRMS} 3}=\frac{\Delta \mathrm{I}_{\mathrm{LOUT}}}{2} \sqrt{\left(\frac{1-\mathrm{D}_{\mathrm{MAX}}}{2 \times 3}\right)} \approx 1.1 \mathrm{~A} \tag{21}
\end{equation*}
$$

Total secondary RMS current ( $\mathrm{I}_{\text {SRMS }}$ ):

$$
\begin{equation*}
\mathrm{I}_{\mathrm{SRMS}}=\sqrt{\mathrm{I}_{\mathrm{SRMS} 1}{ }^{2}+\mathrm{I}_{\mathrm{SRMS} 2}{ }^{2}+\mathrm{I}_{\mathrm{SRMS} 3}{ }^{2}} \approx 36.0 \mathrm{~A} \tag{22}
\end{equation*}
$$

Calculate T1 Primary RMS Current (lipRMs):

$$
\begin{align*}
& \Delta \mathrm{I}_{\mathrm{LMAG}}=\frac{\mathrm{V}_{\mathrm{INMIN}} \times \mathrm{D}_{\text {MAX }}}{\mathrm{L}_{\text {MAG }} \times 2 \times \mathrm{F}_{\mathrm{SW}}} \approx 0.47 \mathrm{~A}  \tag{23}\\
& \mathrm{I}_{\mathrm{PP}}=\left(\frac{\mathrm{P}_{\mathrm{OUT}}}{\mathrm{~V}_{\mathrm{OUT}} \times \eta}+\frac{\Delta \mathrm{I}_{\mathrm{LOUT}}}{2}\right) \frac{1}{\mathrm{a} 1}+\Delta \mathrm{I}_{\mathrm{LMAG}} \approx 3.3 \mathrm{~A}  \tag{24}\\
& \mathrm{I}_{\mathrm{MP}}=\left(\frac{\mathrm{P}_{\mathrm{OUT}}}{\mathrm{~V}_{\mathrm{OUT}} \times \eta}-\frac{\Delta \mathrm{I}_{\mathrm{LOUT}}}{2}\right) \frac{1}{\mathrm{a} 1}+\Delta \mathrm{I}_{\mathrm{LMAG}} \approx 2.8 \mathrm{~A}  \tag{25}\\
& \mathrm{I}_{\mathrm{PRMS} 1}=\sqrt{\left(\mathrm{D}_{\mathrm{MAX}}\right)\left[\mathrm{I}_{\mathrm{PP}} \times \mathrm{I}_{\mathrm{MP}}+\frac{\left(\mathrm{I}_{\mathrm{PP}}-\mathrm{I}_{\mathrm{MP}}\right)^{2}}{3}\right]} \approx 2.5 \mathrm{~A}  \tag{26}\\
& \mathrm{I}_{\mathrm{MP2}}=\mathrm{I}_{\mathrm{PP}}-\left(\frac{\Delta \mathrm{I}_{\mathrm{LOUT}}}{2}\right) \frac{1}{\mathrm{a} 1} \approx 3.0 \mathrm{~A} \tag{27}
\end{align*}
$$

T1 Primary RMS ( lpRMS1 ) current when energy is being delivered to the secondary.

$$
\begin{equation*}
I_{\mathrm{PRMS} 1}=\sqrt{\left(\mathrm{D}_{\mathrm{MAX}}\right)\left[\mathrm{l}_{\mathrm{PP}} \times I_{\mathrm{MP}}+\frac{\left(\mathrm{l}_{\mathrm{PP}}-\mathrm{I}_{\mathrm{MP}}\right)^{2}}{3}\right]} \approx 2.5 \mathrm{~A} \tag{28}
\end{equation*}
$$

T1 Primary RMS ( $\mathrm{I}_{\text {PRMS2 }}$ ) current when the converter is free wheeling.

$$
\begin{equation*}
\mathrm{I}_{\mathrm{PRMS} 2}=\sqrt{\left(1-\mathrm{D}_{\mathrm{MAX}}\right)\left[\mathrm{I}_{\mathrm{PP}} \times \mathrm{I}_{\mathrm{MP2}}+\frac{\left(\mathrm{I}_{\mathrm{PP}}-\mathrm{I}_{\mathrm{MP2}}\right)^{2}}{3}\right]} \approx 1.7 \mathrm{~A} \tag{29}
\end{equation*}
$$

Total T1 primary RMS current ( $l_{\text {PRMS }}$ ):

$$
\begin{equation*}
\mathrm{I}_{\mathrm{PRMS}}=\sqrt{{\mathrm{I}_{\mathrm{PRMS}} 1}^{2}+\mathrm{I}_{\mathrm{PRMS} 2}}{ }^{2} \approx 3.1 \mathrm{~A} \tag{30}
\end{equation*}
$$

We select a transformer with the following specifications:

$$
\begin{align*}
& \mathrm{a} 1=21  \tag{31}\\
& \mathrm{~L}_{\mathrm{MAG}}=2.8 \mathrm{mH} \tag{32}
\end{align*}
$$

Transformer Primary DC resistance:

$$
\begin{equation*}
D C R_{P}=0.215 \Omega \tag{33}
\end{equation*}
$$

Transformer Secondary DC resistance:

$$
\begin{equation*}
\mathrm{DCR}_{\mathrm{s}}=0.58 \Omega \tag{34}
\end{equation*}
$$

Estimated transformer core losses $\left(\mathrm{P}_{\mathrm{T} 1}\right)$ are twice the copper loss.

## NOTE

This is just an estimate and the total losses may vary based on magnetic design.

$$
\begin{equation*}
\mathrm{P}_{\mathrm{T} 1} \approx 2 \times\left(\mathrm{l}_{\mathrm{PRMS}}{ }^{2} \times \mathrm{DCR}_{\mathrm{P}}+2 \times \mathrm{I}_{\mathrm{SRMS}}{ }^{2} \times \mathrm{DCR}_{\mathrm{S}}\right) \approx 7.0 \mathrm{~W} \tag{35}
\end{equation*}
$$

Calculate remaining power budget:

$$
\begin{equation*}
P_{\text {BUDGET }}=P_{\text {BUDGET }}-P_{T 1} \approx 45 \mathrm{~W} \tag{36}
\end{equation*}
$$

### 8.2.2.3 QA, QB, QC, QD FET Selection

In this design to meet efficiency and voltage requirements $20 \mathrm{~A}, 650 \mathrm{~V}$, CoolMOS FETs from Infineon are chosen for QA..QD.

FET drain to source on resistance:

$$
\begin{equation*}
\mathrm{R}_{\mathrm{ds}(o n) \mathrm{QA}}=0.220 \Omega \tag{37}
\end{equation*}
$$

FET Specified Coss:

$$
\begin{equation*}
\mathrm{C}_{\text {OSS_QA_SPEC }}=780 \mathrm{pF} \tag{38}
\end{equation*}
$$

Voltage across drain-to-source $\left(\mathrm{V}_{\mathrm{dsQA}}\right)$ where $\mathrm{C}_{\text {oss }}$ was measured, data sheet parameter:

$$
\begin{equation*}
V_{d s Q A}=25 \mathrm{~V} \tag{39}
\end{equation*}
$$

Calculate average $\mathrm{C}_{\text {oss }}$ [2]:

$$
\begin{equation*}
C_{\text {OSS_QA_AVG }}=C_{\text {OSs_QA_SPEC }} \sqrt{\frac{V_{\text {dsQA }}}{V_{\text {INMAX }}}} \approx 193 \mathrm{pF} \tag{4}
\end{equation*}
$$

QA FET gate charge:

$$
\begin{equation*}
\mathrm{QA}_{\mathrm{g}}=15 \mathrm{nC} \tag{41}
\end{equation*}
$$

Voltage applied to FET gate to activate FET:

$$
\begin{equation*}
V_{g}=12 \mathrm{~V} \tag{42}
\end{equation*}
$$

Calculate QA losses ( $\mathrm{P}_{\mathrm{QA}}$ ) based on $\mathrm{R}_{\mathrm{ds}(\mathrm{on}) \mathrm{QA}}$ and gate charge $\left(\mathrm{QA}_{\mathrm{g}}\right)$ :

$$
\begin{equation*}
P_{\mathrm{QA}}=\mathrm{I}_{\mathrm{PRMS}}{ }^{2} \times \mathrm{R}_{\mathrm{DS}(o n) \mathrm{QA}}+2 \times \mathrm{QA}_{\mathrm{g}} \times \mathrm{V}_{\mathrm{g}} \times \mathrm{f}_{\mathrm{SW}} \approx 2.1 \mathrm{~W} \tag{43}
\end{equation*}
$$

Recalculate power budget:

$$
\begin{equation*}
\mathrm{P}_{\mathrm{BUDGET}}=\mathrm{P}_{\mathrm{BUDGET}}-4 \times \mathrm{P}_{\mathrm{QA}} \approx 36.6 \mathrm{~W} \tag{44}
\end{equation*}
$$

### 8.2.2.4 Selecting $L_{S}$

Calculating the value of the shim inductor $\left(L_{s}\right)$ is based on the amount of energy required to achieve zero voltage switching. This inductor needs to able to deplete the energy from the parasitic capacitance at the switch node. The following equation selects $L_{S}$ to achieve ZVS at $100 \%$ load down to $50 \%$ load based on the primary FET's average total $\mathrm{C}_{\text {oss }}$ at the switch node.

## NOTE

The actual parasitic capacitance at the switched node may differ from the estimate and $L_{s}$ may have to be adjusted accordingly.

$$
\begin{align*}
& \mathrm{L}_{\mathrm{s}} \geq\left(2 \times \mathrm{C}_{\mathrm{OSS} \_\mathrm{OA} \_\mathrm{AVG}}\right) \frac{\mathrm{V}_{\text {INMAX }}}{\left(\frac{\mathrm{I}_{\mathrm{PP}}}{2}-\frac{\Delta \mathrm{I}_{\mathrm{LOUT}}}{2 \times \mathrm{a} 1}\right)^{2}}-\mathrm{L}_{\mathrm{LK}} \approx 26 \mu \mathrm{H}  \tag{45}\\
& \mathrm{~L}_{\mathrm{s}}=26 \mu \mathrm{H} \tag{46}
\end{align*}
$$

Typical shim inductor DC resistance:

$$
\begin{equation*}
\mathrm{DCR}_{\mathrm{LS}}=27 \mathrm{~m} \Omega \tag{47}
\end{equation*}
$$

Estimate $L_{S}$ power loss ( $\mathrm{P}_{\mathrm{LS}}$ ) and readjust remaining power budget:

$$
\begin{align*}
& \mathrm{P}_{\mathrm{LS}}=2 \times \mathrm{I}_{\text {PRMS }}{ }^{2} \times \mathrm{DCR}_{\mathrm{LS}} \approx 0.5 \mathrm{~W}  \tag{48}\\
& \mathrm{P}_{\text {BUDGET }}=\mathrm{P}_{\text {BUDGET }}-\mathrm{P}_{\mathrm{LS}} \approx 36.1 \mathrm{~W} \tag{49}
\end{align*}
$$

### 8.2.2.5 Selecting Diodes $D_{B}$ and $D_{C}$

There is a potential for high voltage ringing on the secondary rectifiers, caused by the difference in current between the transformer and the shim inductor when the transformer comes out of freewheeling. Diodes $D_{B}$ and $\mathrm{D}_{\mathrm{C}}$ provide a path for this current and prevent any ringing by clamping the transformer primary to the primary side power rails. Normally these diodes do not dissipate much power but they should be sized to carry the full primary current. The worse case power dissipated in these diodes is:
$\mathrm{P}=0.5 \times \mathrm{L}_{\mathrm{s}} \times \mathrm{I}_{\text {PRMS }}^{2} \times \mathrm{F}_{\mathrm{SW}}$
The diodes should be ultra-fast types and rated for the input voltage of the converter - $\mathrm{V}_{\mathbb{I N}}$ (410 VDC in this case).
A MURS360 part is suitable at this power level.

### 8.2.2.6 Output Inductor Selection ( $L_{\text {OUT }}$ )

Inductor Lout is designed for $20 \%$ inductor ripple current ( $\Delta \mathrm{L}_{\text {LOUT }}$ ):

$$
\begin{align*}
& \Delta \mathrm{I}_{\text {LOUT }}=\frac{\mathrm{P}_{\text {OUT }} \times 0.2}{\mathrm{~V}_{\text {OUT }}}=\frac{600 \mathrm{~W} \times 0.2}{12 \mathrm{~V}} \approx 10 \mathrm{~A}  \tag{51}\\
& \mathrm{~L}_{\text {OUT }}=\frac{\mathrm{V}_{\text {OUT }} \times\left(1-\mathrm{D}_{\mathrm{TYP}}\right)}{\Delta \mathrm{I}_{\text {LOUT }} \times 2 \times \mathrm{f}_{\mathrm{SW}}} \approx 2 \mu \mathrm{H} \tag{52}
\end{align*}
$$

Calculate output inductor RMS current (lout_RMS):

$$
\begin{align*}
& \mathrm{I}_{\text {LOUT_RMS }}=\sqrt{\left(\frac{\mathrm{P}_{\text {OUT }}}{\mathrm{V}_{\text {OUT }}}\right)^{2}+\left(\frac{\Delta \mathrm{I}_{\text {LOUT }}}{\sqrt{3}}\right)^{2}}=50.3 \mathrm{~A}  \tag{53}\\
& \mathrm{~L}_{\text {OUT }}=2 \mu \mathrm{H} \tag{54}
\end{align*}
$$

Typical output inductor DC resistance:

$$
\begin{equation*}
\mathrm{DCR}_{\text {LOUT }}=750 \mu \Omega \tag{55}
\end{equation*}
$$

Estimate output inductor losses ( $\mathrm{P}_{\text {LOUT }}$ ) and recalculate power budget. Note $\mathrm{P}_{\text {LOUT }}$ is an estimate of inductor losses that is twice the copper loss. Note this may vary based on magnetic manufactures. It is advisable to double check the magnetic loss with the magnetic manufacture.

$$
\begin{align*}
& \mathrm{P}_{\text {LOUT }}=2 \times \mathrm{I}_{\text {LOUT_RMS }}{ }^{2} \times \mathrm{DCR}_{\text {LOUT }} \approx 3.8 \mathrm{~W}  \tag{56}\\
& \mathrm{P}_{\text {BUDGET }}=\mathrm{P}_{\text {BUDGET }}-\mathrm{P}_{\text {LOUT }} \approx 32.8 \mathrm{~W} \tag{57}
\end{align*}
$$

### 8.2.2.7 Output Capacitance ( $C_{\text {OUT }}$ )

The output capacitor is selected based on holdup and transient ( $\mathrm{V}_{\text {TRAN }}$ ) load requirements.
Time it takes $L_{\text {out }}$ to change $90 \%$ of its full load current:

$$
\begin{equation*}
\mathrm{t}_{\mathrm{HU}}=\frac{\frac{\mathrm{L}_{\mathrm{OUT}} \times \mathrm{P}_{\text {OUT }} \times 0.9}{\mathrm{~V}_{\text {OUT }}}}{\mathrm{V}_{\text {OUT }}}=7.5 \mu \mathrm{~s} \tag{58}
\end{equation*}
$$

During load transients most of the current will immediately go through the capacitors equivalent series resistance (ESR ${ }_{\text {COUT }}$ ). The following equations are used to select $E_{\text {ESR }}^{\text {COUT }}$ and $\mathrm{C}_{\text {OUt }}$ based on a $90 \%$ load step in current. The ESR is selected for $90 \%$ of the allowable transient voltage ( $\mathrm{V}_{\text {TRAN }}$ ), while the output capacitance ( $\mathrm{C}_{\text {out }}$ ) is selected for $10 \%$ of $\mathrm{V}_{\text {tRAN }}$.

$$
\begin{gather*}
\mathrm{ESR}_{\text {COUT }} \leq \frac{\mathrm{V}_{\text {TRAN }} \times 0.9}{\frac{\mathrm{P}_{\text {OUT }} \times 0.9}{\mathrm{~V}_{\text {OUT }}}}=12 \mathrm{~m} \Omega  \tag{59}\\
\mathrm{C}_{\text {OUT }} \geq \frac{\frac{\mathrm{P}_{\text {OUT }} \times 0.9 \times \mathrm{t}_{\mathrm{HU}}}{\mathrm{~V}_{\text {OUT }}}}{\mathrm{V}_{\text {TRAN }} \times 0.1} \approx 5.6 \mathrm{mF} \tag{60}
\end{gather*}
$$

Before selecting the output capacitor, the output capacitor RMS current (Icout_RMS) must be calculated.

$$
\begin{equation*}
\mathrm{I}_{\mathrm{COUT} \_\mathrm{RMS}}=\frac{\Delta \mathrm{I}_{\mathrm{LOUT}}}{\sqrt{3}} \approx 5.8 \mathrm{~A} \tag{61}
\end{equation*}
$$

To meet the design requirements five $1500-\mu \mathrm{F}$, aluminum electrolytic capacitors are chosen for the design from United Chemi-Con ${ }^{\text {TM }}$, part number EKY-160ELL152MJ30S. These capacitors have an ESR of $31 \mathrm{~m} \Omega$.
Number of output capacitors:

$$
\begin{equation*}
\mathrm{n}=5 \tag{62}
\end{equation*}
$$

Total output capacitance:

$$
\begin{equation*}
\mathrm{C}_{\mathrm{OUT}}=1500 \mu \mathrm{~F} \times \mathrm{n} \approx 7500 \mu \mathrm{~F} \tag{63}
\end{equation*}
$$

Effective output capacitance ESR:

$$
\begin{equation*}
\mathrm{ESR}_{\mathrm{COUT}}=\frac{31 \mathrm{~m} \Omega}{\mathrm{n}}=6.2 \mathrm{~m} \Omega \tag{64}
\end{equation*}
$$

Calculate output capacitor loss ( $\mathrm{P}_{\text {COUT }}$ ):

$$
\begin{equation*}
\mathrm{P}_{\text {COUT }}=\mathrm{I}_{\text {COUT_RMS }}^{2} \times \mathrm{ESR}_{\text {COUT }} \approx 0.21 \mathrm{~W} \tag{65}
\end{equation*}
$$

Recalculate remaining Power Budget:

$$
\begin{equation*}
\mathrm{P}_{\text {BUDGET }}=\mathrm{P}_{\text {BUDGET }}-\mathrm{P}_{\text {COUT }} \approx 32.6 \mathrm{~W} \tag{66}
\end{equation*}
$$

### 8.2.2.8 Select Rectifier Diodes

Selecting the rectifier diodes begins with determining the voltage and current ratings necessary. In this case the peak diode reverse voltage is given by:
$\mathrm{V}_{\mathrm{r}}=2 \times \frac{\mathrm{V}_{\mathrm{IN}_{\mathrm{Max}}}}{\mathrm{a} 1} \approx 38 \mathrm{~V}$
The average output diode current is given by:
$\mathrm{I}_{\mathrm{f}}=\frac{\mathrm{I}_{\text {OUT_avg }}}{2} \approx 30 \mathrm{~A}$

For this design we select dual 40-A, 45-V Schottky diodes type STPS40L45CT. This is a dual diode and we connect both of the diodes in parallel for current sharing. Each diode in the package will carry approximately half of the $I_{f}$ calculated above, or about 15 A . The forward voltage drop of these diodes at maximum output current will be typically 0.45 V .

The power loss in the output rectifiers is dominated by the $\mathrm{V}_{\mathrm{f}} \mathrm{f}_{\mathrm{f}}$ product.
The loss in each dual diode package is given by:
$\mathrm{P}_{\text {Diode }}=\mathrm{V}_{\mathrm{f}} \times \mathrm{I}_{\mathrm{f}} \approx 13.5 \mathrm{~W}$
The device will require a heatsink to keep its junction temperature at a reasonable level.
The heatsink thermal resistance will have to be less than:
$\mathrm{R}_{\text {TH_HSK_D }}=\frac{\mathrm{T}_{\mathrm{J}_{\text {_max }}}-\mathrm{T}_{\mathrm{A}}}{\mathrm{P}_{\text {Diode }}}-\mathrm{R}_{\mathrm{TH}_{\mathrm{JC}}} \approx 4.5^{\circ} \mathrm{CW}^{-1}$
where $\mathrm{T}_{\mathrm{i} \text { max }}=125^{\circ} \mathrm{C}, \mathrm{T}_{\mathrm{A}}=50^{\circ} \mathrm{C}$, and $\mathrm{R}_{\mathrm{TH} \_\mathrm{jc}}=0.8^{\circ} \mathrm{CW}^{-1}$.
A typical heatsink with this thermal resistance would have dimensions $63.5 \mathrm{~mm} \times 42 \mathrm{~mm} \times 25 \mathrm{~mm}$.
Recalculate the power budget.
$\mathrm{P}_{\text {BUDGET }}=\mathrm{P}_{\text {bUdGET }}-2 \times \mathrm{P}_{\text {Diode }} \approx 5.6 \mathrm{~W}$

### 8.2.2.9 Input Capacitance ( $C_{I N}$ )

The input voltage in this design is $390 \mathrm{~V}_{\mathrm{DC}}$, which is generally fed by the output of a PFC boost pre-regulator. The input capacitance is generally selected based on holdup and ripple requirements.

## NOTE

The delay time needed to achieve ZVS can act as a duty cycle clamp ( $\mathrm{D}_{\text {CLAMP }}$ ).
Calculate tank frequency:

$$
\begin{equation*}
f_{R}=\frac{1}{2 \pi \sqrt{L_{s} \times\left(2 \times C_{\text {OSS_QA_AVG })}\right.}} \tag{72}
\end{equation*}
$$

Estimated delay time:

$$
\begin{equation*}
\mathrm{t}_{\mathrm{DELAY}}=\frac{2}{\mathrm{f}_{\mathrm{R}} \times 4} \approx 314 \mathrm{~ns} \tag{73}
\end{equation*}
$$

Effective duty cycle clamp ( $\mathrm{D}_{\text {CLAMP }}$ ):

$$
\begin{equation*}
D_{\text {CLAMP }}=\left(\frac{1}{2 \times f_{S W}}-t_{\text {DELAY }}\right) \times 2 \times f_{S W}=94 \% \tag{74}
\end{equation*}
$$

$V_{\text {DROP }}$ is the minimum input voltage where the converter can still maintain output regulation. The converter's input voltage would only drop down this low during a brownout or line-drop condition if this converter was following a PFC pre-regulator.

$$
\begin{equation*}
\mathrm{V}_{\mathrm{DROP}}=\frac{\mathrm{a} 1 \times\left(\mathrm{V}_{\mathrm{OUT}}+\mathrm{V}_{\mathrm{f}}\right)}{\mathrm{D}_{\mathrm{CLAMP}}} \approx 278 \mathrm{~V} \tag{75}
\end{equation*}
$$

$\mathrm{C}_{\mathrm{IN}}$ was calculated based on one line cycle of holdup:

$$
\begin{equation*}
\mathrm{C}_{\mathbb{N}} \geq \frac{2 \times \mathrm{P}_{\text {OUT }} \times \frac{1}{60 \mathrm{~Hz}}}{\left(\mathrm{~V}_{\text {IN }}{ }^{2}-\mathrm{V}_{\text {DROP }}{ }^{2}\right)} \approx 364 \mu \mathrm{~F} \tag{76}
\end{equation*}
$$

Calculate high frequency input capacitor RMS current (ICINRMS $)$.

$$
\begin{equation*}
\mathrm{I}_{\text {CINRMS }}=\sqrt{\mathrm{I}_{\text {PRMS } 1}{ }^{2}-\left(\frac{\mathrm{P}_{\text {OUT }}}{\mathrm{V}_{\text {INMIN }} \times \mathrm{a} 1}\right)^{2}}=1.8 \mathrm{~A} \tag{77}
\end{equation*}
$$

To meet the input capacitance and RMS current requirements for this design a $330-\mu \mathrm{F}$ capacitor was chosen from Panasonic part number EETHC2W331EA.

$$
\begin{equation*}
\mathrm{C}_{\mathrm{IN}}=330 \mu \mathrm{~F} \tag{78}
\end{equation*}
$$

This capacitor has a high frequency ( $\mathrm{ESR}_{\mathrm{CIN}}$ ) of $150 \mathrm{~m} \Omega$, measured with an impedance analyzer at 200 kHz .

$$
\begin{equation*}
\mathrm{ESR}_{\mathrm{CIN}}=0.150 \Omega \tag{79}
\end{equation*}
$$

Estimate $\mathrm{C}_{\mathrm{IN}}$ power dissipation ( $\mathrm{P}_{\mathrm{CIN}}$ ):

$$
\begin{equation*}
P_{\mathrm{CIN}}=\mathrm{I}_{\mathrm{CINRMS}}^{2} \times \mathrm{ESR}_{\mathrm{CIN}}=0.5 \mathrm{~W} \tag{80}
\end{equation*}
$$

Recalculate remaining power budget:

$$
\begin{equation*}
\mathrm{P}_{\text {BUDGET }}=\mathrm{P}_{\text {BUDGET }}-\mathrm{P}_{\mathrm{CIN}} \approx 5.0 \mathrm{~W} \tag{81}
\end{equation*}
$$

There is roughly 5.0 W left in the power budget left for the current sensing network, and biasing the control device and all resistors supporting the control device.

### 8.2.2.10 Current Sense Network (CT, $\boldsymbol{R}_{C S}, \boldsymbol{R}_{R}, \boldsymbol{D}_{A}$ )

The CT chosen for this design has a turns ratio ( $\mathrm{CT}_{\text {RAT }}$ ) of 100:1.

$$
\begin{equation*}
C T_{\text {RAT }}=\frac{\mathrm{I}_{\mathrm{P}}}{\mathrm{I}_{\mathrm{S}}}=100 \tag{82}
\end{equation*}
$$

Calculate nominal peak current ( $\mathrm{I}_{\mathrm{P}_{1}}$ ) at $\mathrm{V}_{\text {INMIN }}$ :
Peak primary current:

$$
\begin{equation*}
\mathrm{I}_{\mathrm{P} 1}=\left(\frac{\mathrm{P}_{\text {OUT }}}{\mathrm{V}_{\text {OUT }} \times \eta}+\frac{\Delta \mathrm{I}_{\text {LOUT }}}{2}\right) \frac{1}{\mathrm{a} 1}+\frac{\mathrm{V}_{\text {INMIN }} \times \mathrm{D}_{\text {MAX }}}{\mathrm{L}_{\text {MAG }} \times 2 \times \mathrm{F}_{\mathrm{SW}}} \approx 3.3 \mathrm{~A} \tag{83}
\end{equation*}
$$

The CS pin voltage where peak current limit will trip.

$$
\begin{equation*}
V_{P}=2 V \tag{84}
\end{equation*}
$$

Calculate current sense resistor ( $\mathrm{R}_{\mathrm{CS}}$ ) and leave 300 mV for slope compensation. Include a 1.1 factor for margin:

$$
\mathrm{R}_{\mathrm{CS}}=\frac{\mathrm{V}_{\mathrm{P}}-0.3 \mathrm{~V}}{\frac{\mathrm{I}_{\mathrm{P} 1}}{\mathrm{CT} T_{R A T}} \times 1.1} \approx 47 \Omega
$$

Select a standard resistor for $\mathrm{R}_{\mathrm{CS}}$ :

$$
\begin{equation*}
\mathrm{R}_{\mathrm{CS}}=47 \Omega \tag{86}
\end{equation*}
$$

Estimate power loss for $\mathrm{R}_{\mathrm{Cs}}$ :

$$
\begin{equation*}
\mathrm{P}_{\mathrm{RCS}}=\left(\frac{\mathrm{I}_{\mathrm{PRMS} 1}}{\mathrm{CT}_{\mathrm{RAT}}}\right)^{2} \times \mathrm{R}_{\mathrm{CS}} \approx 0.03 \mathrm{~W} \tag{87}
\end{equation*}
$$

Calculate maximum reverse voltage $\left(\mathrm{V}_{\mathrm{DA}}\right)$ on $\mathrm{D}_{\mathrm{A}}$ :

$$
\begin{equation*}
V_{D A}=V_{P} \frac{D_{\text {CLAMP }}}{1-D_{\text {CLAMP }}} \approx 29.8 \mathrm{~V} \tag{88}
\end{equation*}
$$

Estimate $\mathrm{D}_{\mathrm{A}}$ power loss ( $\mathrm{P}_{\mathrm{DA}}$ ):

$$
\begin{equation*}
\mathrm{P}_{\mathrm{DA}}=\frac{\mathrm{P}_{\mathrm{OUT}} \times 0.6 \mathrm{~V}}{\mathrm{~V}_{\text {INMIN }} \times \eta \times \mathrm{CT}_{\text {RAT }}} \approx 0.01 \mathrm{~W} \tag{89}
\end{equation*}
$$

Calculate reset resistor $R_{R}$ :
Resistor $R_{R}$ is used to reset the current sense transformer CT.

$$
\begin{equation*}
R_{R}=100 \times R_{C S}=4.7 \mathrm{k} \Omega \tag{90}
\end{equation*}
$$

Resistor $\mathrm{R}_{\mathrm{LF}}$ and capacitor $\mathrm{C}_{\mathrm{LF}}$ form a low pass filter for the current sense signal (Pin 15). For this design we chose the following values. This filter has a low frequency pole ( $f_{\text {LFP }}$ ) at 482 kHz . This should work for most applications but may be adjusted to suit individual layouts and EMI present in the design.

$$
\begin{align*}
& \mathrm{R}_{\mathrm{LF}}=1 \mathrm{k} \Omega  \tag{91}\\
& \mathrm{C}_{\mathrm{LF}}=330 \mathrm{pF}  \tag{92}\\
& \mathrm{f}_{\mathrm{LFP}}=\frac{1}{2 \pi \mathrm{f} \times \mathrm{R}_{\mathrm{LF}} \times \mathrm{C}_{\mathrm{LF}}}=482 \mathrm{kHz} \tag{93}
\end{align*}
$$

The UCC3895 REF output (Pin 4) needs a high frequency bypass capacitor to filter out high frequency noise. The maximum amount of capacitance allowed is given in the Recommended Operating Conditions.

$$
\begin{equation*}
C_{R E F}=1 \mu \mathrm{~F} \tag{94}
\end{equation*}
$$

The voltage amplifier reference voltage (Pin 2, EA+) can be set with a voltage divider (R1, R2), for this design example, the error amplifier reference voltage (V1) will be set to 2.5 V . Select a standard resistor value for R1 and then calculate resistor value R2.
UCC3895 reference voltage:

$$
\begin{equation*}
V_{\text {REF }}=5 \mathrm{~V} \tag{95}
\end{equation*}
$$

Set voltage amplifier reference voltage:

$$
\begin{align*}
& \mathrm{V} 1=2.5 \mathrm{~V}  \tag{96}\\
& \mathrm{R} 1=2.37 \mathrm{k} \Omega  \tag{97}\\
& \mathrm{R} 2=\frac{\mathrm{R} 1 \times\left(\mathrm{V}_{\mathrm{REF}}-\mathrm{V} 1\right)}{\mathrm{V} 1}=2.37 \mathrm{k} \Omega \tag{98}
\end{align*}
$$

Voltage divider formed by resistor R3 and R4 are chosen to set the DC output voltage ( $\mathrm{V}_{\text {OUT }}$ ) at Pin 3 (EA-).
Select a standard resistor for R3:

$$
\begin{equation*}
\mathrm{R} 3=2.37 \mathrm{k} \Omega \tag{99}
\end{equation*}
$$

Calculate R4:

$$
\begin{equation*}
\mathrm{R} 4=\frac{\mathrm{R} 3 \times\left(\mathrm{V}_{\text {OUT }}-\mathrm{V} 1\right)}{\mathrm{V} 1} \approx 9 \mathrm{k} \Omega \tag{100}
\end{equation*}
$$

Then choose a standard resistor for R4:

$$
\begin{equation*}
\mathrm{R} 4=\frac{\mathrm{R} 3 \times\left(\mathrm{V}_{\mathrm{OUT}}-\mathrm{V} 1\right)}{\mathrm{V} 1} \approx 9.09 \mathrm{k} \Omega \tag{101}
\end{equation*}
$$

### 8.2.2.10.1 Output Voltage Setpoint

Peak current mode control is chosen for this design and a TL431 (U1) acts as the output voltage error amplifier. It has a $2.5-\mathrm{V}$ internal reference and we want to regulate $\mathrm{V}_{\text {OUt }}$ to 12 V . We set $\mathrm{R}_{\mathrm{B}}$, the lower resistor of the output voltage divider chain to $10 \mathrm{k} \Omega$. $\mathrm{R}_{\mathrm{A}}$ the upper resistor is given by:

$$
\begin{equation*}
R_{A}=R_{B}\left(\frac{V_{\text {OUT }}}{V_{R E F}}-1\right)=38 \mathrm{k} \Omega \tag{102}
\end{equation*}
$$

It is possible, but not necessary, to add a small resistor, $\mathrm{R}_{\text {Loop }}$, in series with the feedback network as a signal injection point for loop stability tests, $\mathrm{R}_{\text {Loop }}$.
The output of $U_{1}$ is transferred across the isolation barrier by the optocoupler $U_{2}$ and fed into the EAP pin of the UCC3895 as a current demand signal. The UCC2895 internal error amplifier is configured as a voltage follower by connecting EAN to EAOUT.

### 8.2.2.10.2 Voltage Loop Compensation

We choose a standard configuration for a TL431 / optocoupler based feedback network. Type 2 loop compensation is appropriate for a design using peak current mode control. First we set the DC operating points for the TL431 (U1) and the optocoupler (U2).
We assume that the optocoupler (U2) has a current transfer ratio (CTR) of 1 and choose to operate it at a maximum LED current, $I_{F}$ of $10 \mathrm{~mA} . \mathrm{R}_{\mathrm{D}}$ is then given by:

$$
\begin{equation*}
R_{D}=\frac{V_{\text {OUT }}-V_{F}-V_{K_{-} M I N}}{I_{F}} \approx 820 \Omega \tag{103}
\end{equation*}
$$

We set the parallel combination of $R_{G}$ and $R_{F}$ to $2.4 \mathrm{k} \Omega$ for a nominal 10-dB gain for output perturbations via the direct path from $R_{D}$ to the optocoupler diode. This path exists in parallel with the path through $R_{A}$ and the TL431. The direct path is important at frequencies where the gain of the TL431 integrator has fallen to 0 dB .
$R_{G}$ and $R_{F}$ form a potential divider whose function is to keep the EAP pin within the upper limit of its common mode input range ( $\mathrm{V}_{\text {CM_MAX }}=3.6 \mathrm{~V}$ ) when there is no current in the photo-transistor. $\mathrm{R}_{\mathrm{G}}$ is connected to VREF and this constraint on the voltage at the EAP pin gives:

$$
\begin{equation*}
R_{G}=R_{F} \frac{V_{R E F}}{V_{C M \_M A X}}-1=0.39 \mathrm{R}_{F} \tag{104}
\end{equation*}
$$

Since we know the parallel value of $R_{F}$ and $R_{G}$ and their ratio ( $R_{F} / R_{G}$ ), we calculate $R F$ as follows:

$$
\begin{equation*}
R_{F}=R_{F} \| R_{G} \frac{1.39}{0.39} \approx 8.6 \mathrm{k} \Omega \tag{105}
\end{equation*}
$$

and

$$
\begin{equation*}
R_{G}=0.39 R_{F}=3.3 \mathrm{k} \Omega \tag{106}
\end{equation*}
$$

At low frequencies the gain is dominated by the response of the TL431 error amplifier which is configured as a pure integrator. The TL431 has a typical open loop gain of about 60 dB at DC, which decreases at the normal -20 dB per decade. Its gain will be 0 dB when the impedance of CE falls to that of RA. Even though the TL431 gain has fallen to 0 dB , the system still has $10-\mathrm{dB}$ gain due to the direct path through RD.
We put the zero due to capacitor $C_{E}$ and resistor $R_{A}$ at the desired $0-\mathrm{dB}$ gain frequency of 2 kHz . Since $\mathrm{R}_{\mathrm{A}}$ is already selected from $\mathrm{V}_{\text {OUT }}$ setpoint considerations we calculate $\mathrm{C}_{\mathrm{E}}$ as follows:

$$
\begin{equation*}
C_{E}=\frac{1}{2 \pi 2000 \mathrm{~Hz} 38 \mathrm{k} \Omega} \approx 22 \mathrm{nF} \tag{107}
\end{equation*}
$$

The optocoupler has a $10-\mathrm{dB}$ response through the direct path, to perturbations on $\mathrm{V}_{\text {OUT }}$. At higher frequencies the capacitance at the collector of the optocoupler ( $\mathrm{C}_{\mathrm{F}}$ ) forms a pole with the resistor in series with the optocoupler LED. The gain then rolls off in half a decade to reach 0 dB . With $\mathrm{CF}=68 \mathrm{nF}$ this pole is at about 2.8 kHz.
Having chosen the component values in the feedback path around the TL431 we can draw a Bode Plot of the VOUT to EAP transfer function $\mathrm{G}_{\mathrm{c}}(\mathrm{f})$.
The control to output transfer function of the power train is approximated by:

$$
G_{C O(f)}=\frac{\Delta V_{O U T}}{\Delta V_{C}} \approx a 1 \times C T_{R A T} \times \frac{R_{L O A D}}{R_{C S}} \times\left(\frac{1+s E S R_{C O U T} \times C_{O U T}}{1+s R_{L O A D} \times C_{O U T}}\right) \times \frac{1}{1+\frac{s}{s_{P P}}+\left(\frac{s}{s_{P P}}\right)^{2}}
$$

where

- $\mathrm{s}=2 \pi \mathrm{j} \mathrm{f}$ is the complex frequency
- $\mathrm{S}_{\text {pp }}$ is $\mathrm{F}_{\text {sw }} / 2=50 \mathrm{kHz}$ in this case
- The overall loop response is then given by $\mathrm{G}_{\mathrm{C}}(\mathrm{f})$. $\mathrm{G}_{\mathrm{C}}(0)$.

This loop response has a crossover frequency of 7.5 kHz . TI recommends that you check the loop stability of the final design with load transient tests and by checking that the gain and phase margins are sufficient. R Loop provides a convenient point to inject signals for loop gain and phase measurements. The feedback network may need to be adjusted to achieve satisfactory performance.

### 8.2.2.10.3 Setting the Switching Frequency

In this design we set the UCC2895 oscillator frequency to 200 kHz to give a switching frequency ( $\mathrm{F}_{\text {sw }}$ ) of 100 kHz at the transformer primary. We set $\mathrm{R}_{\mathrm{T}}=82 \mathrm{k} \Omega$, within the limits given in the RT (Oscillator Timing Resistor) section and rearrange Equation 2 to find the needed value of $\mathrm{C}_{\mathrm{T}}$.

$$
\begin{equation*}
C_{T}=\frac{48 \times\left[t_{O S C}-120 \mathrm{~ns}\right]}{5 \times R_{T}} \approx 560 \mathrm{pF} \tag{109}
\end{equation*}
$$

This value is within the limits for $\mathrm{C}_{\mathrm{T}}$ in the $C T$ (Oscillator Timing Capacitor) section.

### 8.2.2.10.4 Soft Start

$$
\begin{equation*}
I_{R_{T}}=\frac{3 V}{R_{T}} \approx 36 \mu \mathrm{~A} \tag{110}
\end{equation*}
$$

The UCC3895 has a soft-start function to reduce component stresses during the start-up phase. For this design we set the soft-start time to 50 ms . This time is controlled by the value of the capacitor $\mathrm{C}_{\mathrm{ss}}$ at the SS/DISB pin and the charging current set by $\mathrm{R}_{\mathrm{T}}$ (Equation 4).

$$
\begin{equation*}
C_{S S}=I_{R T} \times \frac{t_{S S}}{3.6 V}=\frac{3 V}{R_{T}} \times \frac{t_{S S}}{3.6 V} \approx 470 \mathrm{nF} \tag{111}
\end{equation*}
$$

### 8.2.2.10.5 Setting the Switching Delays

Higher power designs will benefit from the adaptive delays provided by the ADS pin but that feature is not used in this example. Setting RADSH $=0 \Omega$ defeats the adaptive delay and a fixed value for $t_{\text {DELAB }}$ and $t_{\text {DELCD }}$ is used. If it is planned to use the adaptive delay feature then the resistor RADSL should be included in the layout but not populated until delay optimisation is being done on actual hardware.

Figure 20. UCC3895 Adaptive Delays
We set the delay times as follows. The resonant frequency of the shim inductor $L_{s}$ with the stray capacitance at the switched node is given by:

$$
\begin{equation*}
f_{R}=\frac{1}{2 \pi \sqrt{L_{S} \times 2 \times C_{\text {OSS_AVG }}}} \approx 1.6 \mathrm{MHz} \tag{112}
\end{equation*}
$$

Set the initial $t_{\text {ABSET }}$ and $\mathrm{t}_{\text {CDSET }}$ values to half the resonant period

$$
\begin{equation*}
t_{D E L A Y}=314 \mathrm{~ns} \tag{113}
\end{equation*}
$$

The resistors $\mathrm{R}_{\mathrm{AB}}$ and $\mathrm{R}_{\mathrm{CD}}$ are given by a modified version of Equation 5 and Equation 6.

$$
\begin{equation*}
R_{A B}=R_{C D}=\frac{\left(t_{D E L A Y}-25 \mathrm{~ns}\right) \times 0.5 \mathrm{~V}}{25 \times 10^{-12}} \approx 5.6 \mathrm{k} \Omega \tag{114}
\end{equation*}
$$

It is important to recognise that the delay times set by $\mathrm{R}_{\mathrm{AB}}$ and $\mathrm{R}_{\mathrm{CD}}$ are those measured at the device pins. Propagation delays mean that the delay times seen at the primary of the transformer will be different and this is the reason why the delays have to be optimised on actual hardware. Once the prototype is up and running it is recommended that you fine tune $t_{\text {ABSET }}$ and $\mathrm{t}_{\text {CDSET }}$ at light load. Refer to Figure 21 and Figure 22. It is easier to achieve ZVS at the drain of QD than at the drain of QA because the output inductor current reflected in the transformer primary is greater at QD and QC turn-off than it is at QA and QB turn-off.

Figure 21. $\mathrm{t}_{\text {ABSET }}$ to Achieve Valley Switching at Light Loads

Figure 22. $\mathrm{t}_{\text {CDSET }}$ to Achieve Valley Switching at Light Loads

### 8.2.2.10.6 Setting the Slope Compensation

Slope compensation is necessary to stabilise a converter operating in peak current mode at duty cycles greater than $50 \%$. The optimum slope compensation ramp should be half the inductor current ramp downslope during the off time. This slope is calculated as follows:

$$
\begin{equation*}
\mathrm{m}_{\mathrm{e}}=0.5 \frac{V_{O U T} \times R_{C S}}{L_{O U T} \times a 1 \times C T_{R A T}}=67 \mathrm{mv}^{2} \mu \mathrm{~s}^{-1} \tag{115}
\end{equation*}
$$

The magnetizing current of the power transformer provides part of the compensating ramp and is calculated as follows. The $\mathrm{V}_{\mathbb{I}} \times \mathrm{D}_{\text {TYP }}$ factor takes account of the fact that the slope of the magnetizing current is less at lower input voltages.

$$
\begin{equation*}
m_{M A G}=\frac{V_{I N} \times D_{T Y P} \times R_{C S}}{L_{M A G} \times C T_{R A T}} \approx 43 \mathrm{mv}^{\mu \mathrm{s}}{ }^{-1} \tag{116}
\end{equation*}
$$

The added slope compensation ramp is then:

$$
\begin{equation*}
m_{S U M}=m_{e}-m_{M A G} \approx 24 m v \mu s^{-1} \tag{117}
\end{equation*}
$$

The resistor $\mathrm{R}_{\text {SC }}$ sets the added slope compensation ramp, $\mathrm{m}_{\text {SUM }}$ and is chosen as follows:

$$
\begin{equation*}
R_{S C}=R_{L F} \times \frac{8 \times I_{R T}}{m_{M A G} \times C_{T}}=21 \mathrm{k} \Omega \tag{118}
\end{equation*}
$$

A small AC coupling capacitor is used in the emitter of Q1 to eliminate the need for offset biasing circuitry. $C_{C}=1$ nF .
The resistor $R_{E L}$ is a DC load resistor for the emitter of $Q 1$. It should have the same value as $R_{S C}$.

A small capacitor at the RAMP pin input helps suppress high frequency noise, we set $\mathrm{C}_{\text {RAMP }}=56 \mathrm{pF}$. Transistor Q1 is a small signal NPN type.
In peak current mode control the RAMP pin receives the current sense signal, plus the slope compensation ramp, through the $510-\Omega$ resistor $R_{\text {RCs }}$. The $10-\mathrm{k} \Omega$ resistor $R_{R B}$ provides approximately $250-\mathrm{mV}$ offset bias. The value of this resistor may be adjusted up or down to alter the point at which the internal no load comparator trips.

## 9 Power Supply Recommendations

The UCC3895 device should be operated from a $\mathrm{V}_{\mathrm{DD}}$ rail within the limits given in the Recommended Operating Conditions of this data sheet. To avoid the possibility that the device might stop switching, $\mathrm{V}_{\mathrm{DD}}$ must not be allowed to fall into the UVLO(off) range. In order to minimize power dissipation in the device, $\mathrm{V}_{\mathrm{DD}}$ should not be unnecessarily high. Keeping $\mathrm{V}_{\mathrm{DD}}$ at 12 V is a good compromise between these competing constraints. The gate drive outputs from the UCC3895 device deliver large-current pulses into their loads. This indicates the need for a low-ESR decoupling capacitor to be connected as directly as possible between the $\mathrm{V}_{\mathrm{DD}}$ and PGND terminals.
TI recommends ceramic capacitors with stable dielectric characteristics over temperature, such as X7R. Avoid capacitors which have a large drop in capacitance with applied DC voltage bias. For example, use a part that has a low-voltage co-efficient of capacitance. The recommended decoupling capacitance is $1 \mu \mathrm{~F}, \mathrm{X} 7 \mathrm{R}$, with at least a $25-\mathrm{V}$ rating with a $0.1-\mu \mathrm{F}$ NPO capacitor in parallel.

## 10 Layout

### 10.1 Layout Guidelines

In order to increase the reliability and robustness of the design, it is recommended that the following layout guidelines are followed.

- EAN pin - This is the inverting input to the error amplifier. It is a high impedance pin and is susceptible to noise pickup. Keep tracks from this pin as short as possible.
- EAP pin - This is the non-inverting input to the error amplifier. It is a high impedance pin and is susceptible to noise pickup. Keep tracks from this pin as short as possible.
- EAOUT - pin Keep tracks from this pin as short as possible.
- RAMP,CT, RT, DELAB, DELCD and ADS pins - The components connected to these pins are used to set important operating parameters. Keep these components close to the IC and provide short, low impedance return connections to the GND pin.
- REF pin - Decouple this pin to GND with a good quality ceramic capacitor. A $1-\mu \mathrm{F}, \mathrm{X} 7 \mathrm{R}, 25-\mathrm{V}$ capacitor is recommended. Keep REF PCB tracks as far away as possible from sources of switching noise.
- SYNC pin - This pin is essentially a digital I/O port. If it is unused, then it may be left open circuit. If Synchronisation is used, then route the incoming Synchronisation signal as far away from noise sensitive input pins as possible.
- CS pin - This connection is arguably the most important single connection in the entire PSU system. Avoid running the CS signal traces near to sources of high dv/dt. Provide a simple RC filter as close as possible to the pin to help filter out leading edge noise spikes which will occur at the beginning of each switching cycle.
- SS/DISB pin - Keep tracks from this pin as short as possible. If the Enable signal is coming from a remote source then avoid running it close to any source of high dv/dt (MOSFET Drain connections for example) and add a simple RC filter at the SS/DISB pin.
- OUTA, OUTB, OUTC, and OUTD pins - These are the gate drive output pins and will have a high dv/dt rate associated with their rising and falling edges. Keep the tracks from these pins as far away from noise sensitive input pins as possible. Ensure that the return currents from these outputs do not cause voltage changes in the analog ground connections to noise sensitive input pins.
- VDD pin - This pin must be decoupled to PGND using ceramic capacitors as detailed in the Power Supply Recommendations section. Keep this capacitor as close to the VDD and PGND pins as possible.
- GND pin - This pin provides the analog ground reference to the controller. Use this pin to provide a return path for the components at the RAMP, REF, CT, RT, DELAB, DELCD, ADS, CS, and SS/DISB pins. Use a Ground Plane to minimise the impedance of the ground connection and to reduce noise pickup. It is important to have a low impedance connection from GND to PGND.
- PGND pin - This pin provides the ground reference to the controller. This pin should be used to return the currents from the OUTX and SYNC pins. Use a Ground Plane to minimise the impedance of the ground connection and to reduce noise pickup.
An ideal ground plane provides an equipotential surface to which the controller ground pins can be connected. However, real ground planes have a non-zero impedance and having separate ground planes for analog and driver circuits is an easy way to prevent the analog ground from being disturbed by driver return currents. A single ground plane may be used if care is taken to ensure that the driver return currents are kept away from the part of the ground plane used for analog connections.

### 10.2 Layout Example

Further layout information for this device is given in application report SLUA501.

${ }^{(1)}$ The marketing status values are defined as follows:
ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.
NRND: Not recommended for new designs. Device is in production to support existing customers, but Tl does not recommend using this part in a new design
PREVIEW: Device has been announced but is not in production. Samples may or may not be available.
OBSOLETE: TI has discontinued the production of the device.
${ }^{(2)}$ RoHS: TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed $0.1 \%$ by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free"
RoHS Exempt: TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption
Green: TI defines "Green" to mean the content of Chlorine (CI) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.
${ }^{(3)}$ MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.
${ }^{(4)}$ There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.
${ }^{(5)}$ Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.
${ }^{(6)}$ Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width

PACKAGE OUTLINE
TSSOP - 1.2 mm max height

NOTES:

1. All linear dimensions are in millimeters. Any dimensions in parenthesis are for reference only. Dimensioning and tolerancing per ASME Y14.5M.
2. This drawing is subject to change without notice.
3. This dimension does not include mold flash, protrusions, or gate burrs. Mold flash, protrusions, or gate burrs shall not exceed 0.15 mm per side.
4. This dimension does not include interlead flash. Interlead flash shall not exceed 0.25 mm per side.
5. Reference JEDEC registration MO-153.

NOTES: (continued)
6. Publication IPC-7351 may have alternate designs.
7. Solder mask tolerances between and around signal pads can vary based on board fabrication site.

SOLDER PASTE EXAMPLE
BASED ON 0.125 mm THICK STENCIL SCALE: 10X

NOTES: (continued)
8. Laser cutting apertures with trapezoidal walls and rounded corners may offer better paste release. IPC-7525 may have alternate design recommendations.
9. Board assembly site may have different recommendations for stencil design.

| $P W$ (R-PDSO-G20) | PLASTIC SMALL OUTLINE |
| :---: | :---: |
| Example Board Layout | Based on a stencil thickness of .127 mm (.005inch). |

NOTES: A. All linear dimensions are in millimeters.
B. This drawing is subject to change without notice.
C. Publication IPC-7351 is recommended for alternate design.
D. Laser cutting apertures with trapezoidal walls and also rounding corners will offer better paste release. Customers should contact their board assembly site for stencil design recommendations. Refer to IPC-7525 for other stencil recommendations.
E. Customers should contact their board fabrication site for solder mask tolerances between and around signal pads.

| DIM PINS ** | 14 | 16 | 18 | 20 |
| :---: | :---: | :---: | :---: | :---: |
| A | 0.300 <br> $(7,62)$ <br> BSC | 0.300 <br> $(7,62)$ <br> BSC | 0.300 <br> $(7,62)$ <br> BSC | 0.300 <br> $(7,62)$ <br> BSC |
| B MAX | 0.785 <br> $(19,94)$ | .840 <br> $(21,34)$ | 0.960 <br> $(24,38)$ | 1.060 <br> $(26,92)$ |
| B MIN | - | - | - | - |
| C MAX | 0.300 <br> $(7,62)$ | 0.300 <br> $(7,62)$ | 0.310 <br> $(7,87)$ | 0.300 <br> $(7,62)$ |
| C MIN | 0.245 <br> $(6,22)$ | 0.245 <br> $(6,22)$ | 0.220 <br> $(5,59)$ | 0.245 <br> $(6,22)$ |

NOTES: A. All linear dimensions are in inches (millimeters).
B. This drawing is subject to change without notice.
C. This package is hermetically sealed with a ceramic lid using glass frit.
D. Index point is provided on cap for terminal identification only on press ceramic glass frit seal only.
E. Falls within MIL STD 1835 GDIP1-T14, GDIP1-T16, GDIP1-T18 and GDIP1-T20.

N (R-PDIP-T**)
PLASTIC DUAL-IN-LINE PACKAGE
16 PINS SHOWN

NOTES: A. All linear dimensions are in inches (millimeters).
B. This drawing is subject to change without notice.
C) Falls within JEDEC MS-001, except 18 and 20 pin minimum body length (Dim A).

D The 20 pin end lead shoulder width is a vendor option, either half or full width.

NOTES:

1. All linear dimensions are in millimeters. Dimensions in parenthesis are for reference only. Dimensioning and tolerancing per ASME Y14.5M.
2. This drawing is subject to change without notice.
3. This dimension does not include mold flash, protrusions, or gate burrs. Mold flash, protrusions, or gate burrs shall not exceed 0.15 mm per side.
4. This dimension does not include interlead flash. Interlead flash shall not exceed 0.43 mm per side
5. Reference JEDEC registration MS-013.

NOTES: (continued)
6. Publication IPC-7351 may have alternate designs.
7. Solder mask tolerances between and around signal pads can vary based on board fabrication site.

SOLDER PASTE EXAMPLE BASED ON 0.125 mm THICK STENCIL

SCALE:6X

NOTES: (continued)
8. Laser cutting apertures with trapezoidal walls and rounded corners may offer better paste release. IPC-7525 may have alternate design recommendations.
9. Board assembly site may have different recommendations for stencil design.
