

LM95071-Q1 SPI/MICROWIRE 13 位带符号温度传感器

1 特性

- 符合面向汽车应用的 AEC-Q100 标准
 - 器件温度等级 0: -40°C 至 $+150^{\circ}\text{C}$, T_A
- 小型 SOT-23 封装节省空间
- 关断模式可在两次读取温度期间节省能量
- 在 -40°C 至 $+150^{\circ}\text{C}$ 整个温度范围内正常工作
- SPI 和 MICROWIRE 总线接口
- 主要规格
 - 电源电压: 2.4V 至 5.5V
 - 电源电流
 - 工作电流: 280 μA (典型值)
 - 关断电流: 6 μA (典型值)
 - 温度精度
 - 0°C 至 70°C $\pm 1^{\circ}\text{C}$ (最大值)
 - -40°C 至 150°C $\pm 2^{\circ}\text{C}$ (最大值)
 - 温度分辨率 0.03125 $^{\circ}\text{C}$

2 应用

- 汽车
- 系统热管理
- 便携式电子设备
- 个人计算机
- 磁盘驱动器
- 办公电子设备
- 电子测试设备

3 说明

LM95071-Q1 是一款低功耗、高分辨率数字温度传感器，具有 SPI 和 MICROWIRE 兼容接口，采用 5 引脚 Q1-23 封装。主机可随时查询 LM95071-Q1 以读取温度。它的工作电流低，非常适合低功耗至关重要的系统。

LM95071-Q1 具有 13 位带符号温度分辨率 (0.03125 $^{\circ}\text{C}/\text{LSB}$)，工作温度范围为 -40°C 至 $+150^{\circ}\text{C}$ 。

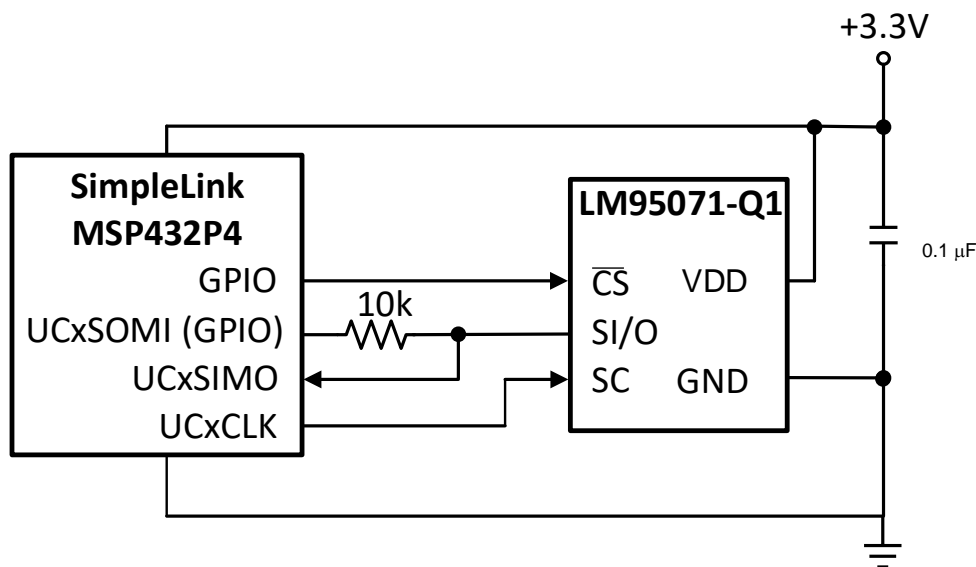

LM95071-Q1 的电源电压范围为 2.4V 至 5.5V，转换速率快、电源电流低以及 SPI 接口简单，因此广泛适用于各种应用。

2018 年 12 月	*	初始发行版。将 SNIS137 中的汽车器件移到了单独的数据表中，将 AEC-Q100 资质水平添加到数据表中，将数据表布局更新为最新 SDS 格式，更改了第一页的重要图形，更改了“温度-数字转换器特征”表注以澄清转换间隔，并用热性能信息表替换了热工特性表，以及更新了热阻值

5 Pin Configuration and Functions

Pin Function

PIN		DESCRIPTION
NO.	NAME	
1	\overline{CS}	Chip Select input. This pin receives an active-low signal from the controller to select the device.
2	GND	Ground. This is the power and signal ground return.
3	SI/O	Serial Input/Output. This serial, bidirectional, data bus pin transmits and receives signals to and from the controller. Schmitt trigger input in the input mode.
4	SC	Serial bus clock. This serial clock signal comes from the controller. Schmitt trigger input.
5	V_{DD}	Positive Supply Voltage. Supply a DC voltage from 2.4V to 5.5V to this pin and bypass with a 0.1- μ F ceramic capacitor to ground.

8 Detailed Description

8.1 Overview

The LM95071-Q1 temperature sensor incorporates a temperature sensor and 13-bit-plus-sign $\Delta\Sigma$ ADC (Delta-Sigma Analog-to-Digital Converter). Compatibility of the LM95071-Q1's three-wire serial interface with SPI and MICROWIRE allows simple communications with common microcontrollers and processors. Shutdown mode can be used to optimize current drain for different applications. A Manufacturer/Device ID register identifies the LM95071-Q1 as a Texas Instruments product.

8.2 Functional Block Diagram

8.3 Feature Description

8.3.1 Power Up and Power Down

The LM95071-Q1 always powers up in a known state and in the continuous conversion mode. Immediately after power up, the LM95071-Q1 will output an erroneous code until the first temperature conversion has completed.

When the supply voltage is less than about 1.6V (typical), the LM95071-Q1 is considered powered down. As the supply voltage rises above the nominal 1.6-V power up threshold, the internal registers are reset to the power up default state described above.

8.3.2 Temperature Data Format

Temperature data is represented by a 14-bit, two's complement word with an LSB (Least Significant Bit) equal to 0.03125°C:

Table 1. Digital Output for Temperature Data

Temperature	Digital Output	
	Binary	Hex
+150°C	0100 1011 0000 0011	4B03
+125°C	0011 1110 1000 0011	3E83
+25°C	0000 1100 1000 0011	0C83
+0.03125°C	0000 0000 0000 0111	0007
0°C	0000 0000 0000 0011	0003

Table 1. Digital Output for Temperature Data (continued)

Temperature	Digital Output	
	Binary	Hex
-0.03125°C	1111 1111 1111 1111	FFFF
-25°C	1111 0011 1000 0011	F383
-40°C	1110 1100 0000 0011	EC03

The first data byte is the most significant byte with most significant bit first, permitting only as much data as necessary to be read to determine temperature condition. For instance, if the first four bits of the temperature data indicate an overtemperature condition, the host processor could immediately take action to remedy the excessive temperatures.

8.3.3 Tight Accuracy, Fine Resolution and Low Noise

The LM95071-Q1 is well suited for applications that require tight temperature measurement accuracy. In many applications, from process control to HVAC, the low temperature error can mean better system performance and, by eliminating a system calibration step, lower production cost.

With fine digital resolution, the LM95071-Q1 senses and reports very small changes in its temperature, making it ideal for applications where temperature sensitivity is important. For example, the LM95071-Q1 enables the system to quickly identify the direction of temperature change, allowing the processor to take compensating action before the system reaches a critical temperature.

The LM95071-Q1 has very low output noise (see [Figure 7](#) in the *Typical Characteristics* section), which makes it ideal for applications where stable thermal compensation is a priority. For example, in a temperature-compensated oscillator application, the very small deviation in successive temperature readings translates to a stable frequency output from the oscillator.

8.4 Device Functional Modes

8.4.1 Shutdown Mode/Manufacturer ID

The master controller may enable the shutdown mode for the purpose of reducing power consumption or for reading the Manufacturer/Device ID information. The shutdown mode is enabled by writing XX FF hex to the LM95071-Q1 as shown in [Figure 13c](#). The serial bus is still active when the LM95071-Q1 is in shutdown. When in shutdown mode the LM95071-Q1 always will output 1000 0000 0000 1111. This is the Manufacturer/Device ID information. The first 5-bits of the field (1000 0XXX) are reserved for the manufacturer ID.

8.5 Programming

8.5.1 Serial Bus Interface

The LM95071-Q1 operates as a slave and is compatible with SPI or MICROWIRE bus specifications. Data is clocked out on the falling edge of the serial clock (SC), while data is clocked in on the rising edge of SC. A complete communication is framed by falling and rising chip select (CS) signal. The CS signal should be held high for at least one clock cycle (160 ns minimum) between communications. The transmit-only communication (register read) consists of 16 clock cycles. A complete transmit/receive communication will consist of 32 serial clocks (see [Serial Bus Timing Diagrams](#)). The first 16 clocks comprise the transmit phase of communication, while the second 16 clocks are the receive phase.

When \overline{CS} is high SI/O will be in TRI-STATE. Communication should be initiated by taking chip select (\overline{CS}) low. This should not be done when SC is changing from a low to high state. Once \overline{CS} is low the serial I/O pin (SI/O) will transmit the first bit of data. The master can then read this bit with the rising edge of SC. The remainder of the data will be clocked out by the falling edge of SC. \overline{CS} can be taken high at any time during the transmit phase. If \overline{CS} is brought low in the middle of a conversion the LM95071-Q1 will complete the conversion and the output shift register will be updated after \overline{CS} is brought back high.

Programming (continued)

The receive phase of a communication starts after 16 SC periods. \overline{CS} can remain low for 32 SC cycles. The LM95071/LM95071-Q1 will read the data available on the SI/O line on the rising edge of the serial clock. Input data is to an 8-bit shift register. The part will detect the last eight bits shifted into the register. The receive phase can last up to 16 SC periods. All ones must be shifted in order to place the part into shutdown. All zeros must be shifted in order to place the LM95071-Q1 into continuous conversion mode. Only the following codes should be transmitted to the LM95071-Q1:

- 00 hex for continuous conversion
- FF hex for shutdown

Another code may place the part into a test mode. Test modes are used by Texas Instruments to thoroughly test the function of the LM95071-Q1 during production testing. Only eight bits have been defined above since only the last eight transmitted are detected by the LM95071-Q1, before \overline{CS} is taken HIGH.

The following communication can be used to determine the Manufacturer's/Device ID and then immediately place the part into continuous conversion mode. With \overline{CS} continuously low:

- Read 16 bits of temperature data
- Write 16 bits of data commanding shutdown
- Read 16 bits of Manufacture's/Device ID data
- Write 8 to 16 bits of data commanding Conversion Mode
- Take \overline{CS} HIGH.

Note that 228 ms (max) will have to pass for a conversion to complete before the LM95071-Q1 actually transmits temperature data.

8.6 Register Maps

8.6.1 Internal Register Structure

The LM95071-Q1 has three registers: the temperature register, the configuration register and the Manufacturer/Device identification register. The temperature and Manufacturer/Device identification registers are read only. The configuration register is write only.

8.6.1.1 Configuration Register

(Selects shutdown or continuous conversion modes):

Shutdown

D0–D15 set to XX FF hex enables shutdown mode.

D0–D15 set to XX 00 hex sets continuous-conversion mode.

Note: setting D0–D15 to any other values may place the LM95071-Q1 into a manufacturer's test mode, upon which the LM95071-Q1 will stop responding as described. These test modes are to be used for Texas Instruments production testing only. See [Serial Bus Interface](#) for a complete discussion.

(1) The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSOLETE: TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

RoHS Exempt: TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

Green: TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.
