

LMK61PD0A2 超低抖动引脚可选振荡器

1 特性

- 超低噪声、高性能
 - 抖动: $f_{OUT} > 100\text{MHz}$ 时的典型值为 90fs (RMS)
 - 高电源抑制比 (PSRR): -70dBc, 出色的电源抗扰度
- 灵活的输出频率和格式: 用户可选择
 - 频率: 62.5MHz、100MHz、106.25MHz、125MHz、156.25MHz、212.5MHz、312.5MHz
 - 格式: 低电压正射极耦合逻辑 (LVPECL)、低压差分信令 (LVDS) 或高速收发器逻辑 (HSTL)
- 总频率容差: $\pm 50\text{ppm}$
- 内部存储器存储了多个启动配置, 可通过引脚控制进行选择
- 3.3V 工作电压
- 工业温度范围 (-40°C 至 +85°C)
- 7mm x 5mm 8 引脚封装

2 应用

- 晶体振荡器、表面声波 (SAW) 振荡器或芯片振荡器的高性能替换产品
- 开关、路由器、网卡、基带装置 (BBU)、服务器、存储/SAN
- 测试和测量
- 医疗成像
- 现场可编程门阵列 (FPGA), 处理器连接

3 说明

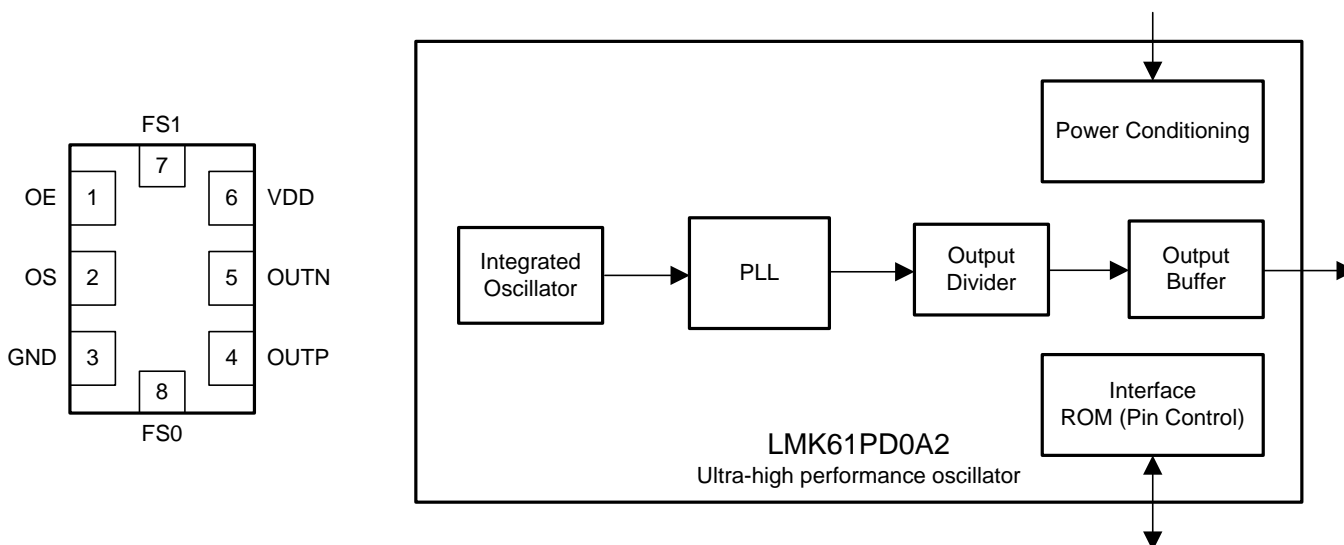

LMK61PD0A2 是一款超低抖动的 PLLatinum™ 引脚可选振荡器。该振荡器可生成通用基准时钟。该器件在出厂前进行了预编程, 可支持七种不同基准时钟频率。相应频率可通过将每个 FS[1:0] 配置为 VDD、GND 或 NC (无连接) 进行选择。输出格式可通过将操作系统 (OS) 的引脚配置为 VDD、GND 或 NC 进行选择, 三种配置方式分别对应格式 LVPECL、LVDS 以及 HCSL。内部电源调节功能提供出色的电源纹波抑制 (PSRR), 降低了供电网络的成本和复杂性。该器件由单个 $3.3\text{V} \pm 5\%$ 电源供电。

7 Specifications

7.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted)⁽¹⁾

		MIN	MAX	UNIT
VDD	Device Supply Voltage	-0.3	3.6	V
V _{IN}	Output Voltage Range for Logic Inputs	-0.3	VDD + 0.3	V
V _{OUT}	Output Voltage Range for Clock Outputs	-0.3	VDD + 0.3	V
T _J	Junction Temperature		150	°C
T _{STG}	Storage Temperature	-40	125	°C

(1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions*. Exposure to absolute maximum-rated conditions for extended periods may affect device reliability.

7.2 ESD Ratings

		VALUE	UNIT
V _(ESD)	Electrostatic discharge	Human-body model (HBM), per ANSI/ESDA/JEDEC JS-001 ⁽¹⁾	V
		Charged-device model (CDM), per JEDEC specification JESD22-C101 ⁽²⁾	
		±4000	
		±1500	

(1) JEDEC document JEP155 states that 500 V HBM allows safe manufacturing with a standard ESD control process.

(2) JEDEC document JEP157 states that 250 V CDM allows safe manufacturing with a standard ESD control process.

7.3 Recommended Operating Conditions

over operating free-air temperature range (unless otherwise noted)

		MIN	NOM	MAX	UNIT
VDD	Device Supply Voltage	3.135	3.3	3.465	V
T _A	Ambient Temperature	-40	25	85	°C
T _J	Junction Temperature			125	°C
t _{RAMP}	VDD Power-Up Ramp Time	0.1		100	ms

7.4 Thermal Information

9 Detailed Description

9.1 Overview

The LMK61PD0A2 is a pin selectable oscillator that generates commonly used reference clocks, greater than 100 MHz, with less than 200 fs, rms max random jitter.

9.2 Functional Block Diagram

NOTE

Control blocks are compatible with 1.8/2.5/3.3 V I/O voltage levels.

9.3 Feature Description

9.3.1 Device Block-Level Description

The LMK61PD0A2 comprises of an integrated oscillator that includes a 50 MHz crystal, a fractional PLL with integrated VCO. Completing the device is the combination of an integer output divider and a universal differential output buffer. The on-chip ROM contains seven pre-programmed output frequency plans that selects the appropriate settings for the integrated oscillator, PLL blocks and output divider. [Table 1](#) lists the supported output frequency plans that can be selected by pin-strapping FS[1:0] as required. [Table 2](#) lists the supported output types that can be selected by pin-strapping OS and OE as required. The device is powered by on-chip low dropout (LDO) linear voltage regulators and the regulated supply network is partitioned such that the sensitive analog supplies are running from separate LDOs than the digital supplies which use their own LDO. The LDOs provide isolation from any noise in the external power supply rail with a PSRR of better than -70 dBc at 50 kHz to 1 MHz ripple frequencies at 3.3 V device supply.

9.3.2 Device Configuration Control

The LMK61PD0A2 selects an output frequency plan and output type using control pins FS[1:0].

10 Application and Implementation

NOTE

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

10.1 Application Information

The LMK61PD0A2 is an ultra-low jitter pin selectable oscillator that can be used to provide reference clocks for high-speed serial links resulting in improved system performance.

10.2 Typical Application

10.2.1 Jitter Considerations in Serdes Systems

Jitter-sensitive applications such as 10 Gbps or 100 Gbps Ethernet, deploy a serial link utilizing a Serializer in the transmit section (TX) and a De-serializer in the receive section (RX). These SERDES blocks are typically embedded in an ASIC or FPGA. Estimating the clock jitter impact on the link budget requires understanding of the TX PLL bandwidth and the RX CDR bandwidth.

As can be seen in [Figure 15](#), the pass band region between the TX low pass cutoff and RX high pass cutoff frequencies is the range over which the reference clock jitter adds without any attenuation to the jitter budget of the link. Outside of these frequencies, the SERDES link will attenuate the reference clock jitter with a 20 dB/dec or even steeper roll-off. Modern ASIC or FPGA designs have some flexibility on deciding the optimal RX CDR bandwidth and TX PLL bandwidth. These bandwidths are typically set based on what is achievable in the ASIC or FPGA process node, without increasing design complexity, and on any jitter tolerance or wander specification that needs to be met, as related to the RX CDR bandwidth.

The overall allowable jitter in a serial link is dictated by IEEE or other relevant standards. For example, IEEE802.3ba states that the maximum transmit jitter (peak-peak) for 10 Gbps Ethernet should be no more than $0.28 * UI$ and this equates to a 27.1516 ps, p-p for the overall allowable transmit jitter.

The jitter contributing elements are made up of the reference clock, generated potentially from a device like LMK61PD0A2, the transmit medium, transmit driver etc. Only a portion of the overall allowable transmit jitter is allocated to the reference clock, typically 20% or lower. Therefore, the allowable reference clock jitter, for a 20% clock jitter budget, is 5.43 ps, p-p.

Jitter in a reference clock is made up of deterministic jitter (arising from spurious signals due to supply noise or mixing from other outputs or from the reference input) and random jitter (usually due to thermal noise and other uncorrelated noise sources). A typical clock tree in a serial link system consists of clock generators and fanout buffers. The allowable reference clock jitter of 5.43 ps, p-p is needed at the output of the fanout buffer. Modern fanout buffers have low additive random jitter (less than 100 fs, rms) with no substantial contribution to the deterministic jitter. Therefore, the clock generator and fanout buffer contribute to the random jitter while the primary contributor to the deterministic jitter is the clock generator. Rule of thumb, for modern clock generators, is to allocate 25% of allowable reference clock jitter to the deterministic jitter and 75% to the random jitter. This amounts to an allowable deterministic jitter of 1.36 ps, p-p and an allowable random jitter of 4.07 ps, p-p. For serial link systems that need to meet a bit error rate (BER) of 10^{-12} , the allowable random jitter in root-mean-square is 0.29 ps, rms. This is calculated by dividing the p-p jitter by 14 for a BER of 10^{-12} . Accounting for random jitter from the fanout buffer, the random jitter needed from the clock generator is 0.27 ps, rms. This is calculated by the root-mean-square subtraction from the desired jitter at the fanout buffer's output assuming 100 fs, rms of additive jitter from the fanout buffer.

With careful frequency planning techniques, like spur optimization (covered in the Spur Mitigation Techniques section) and on-chip LDOs to suppress supply noise, the LMK61PD0A2 is able to generate clock outputs with deterministic jitter that is below 1 ps, p-p and random jitter that is below 0.2 ps, rms. This gives the serial link system with additional margin on the allowable transmit jitter resulting in a BER better than 10^{-12} .

Typical Application (continued)

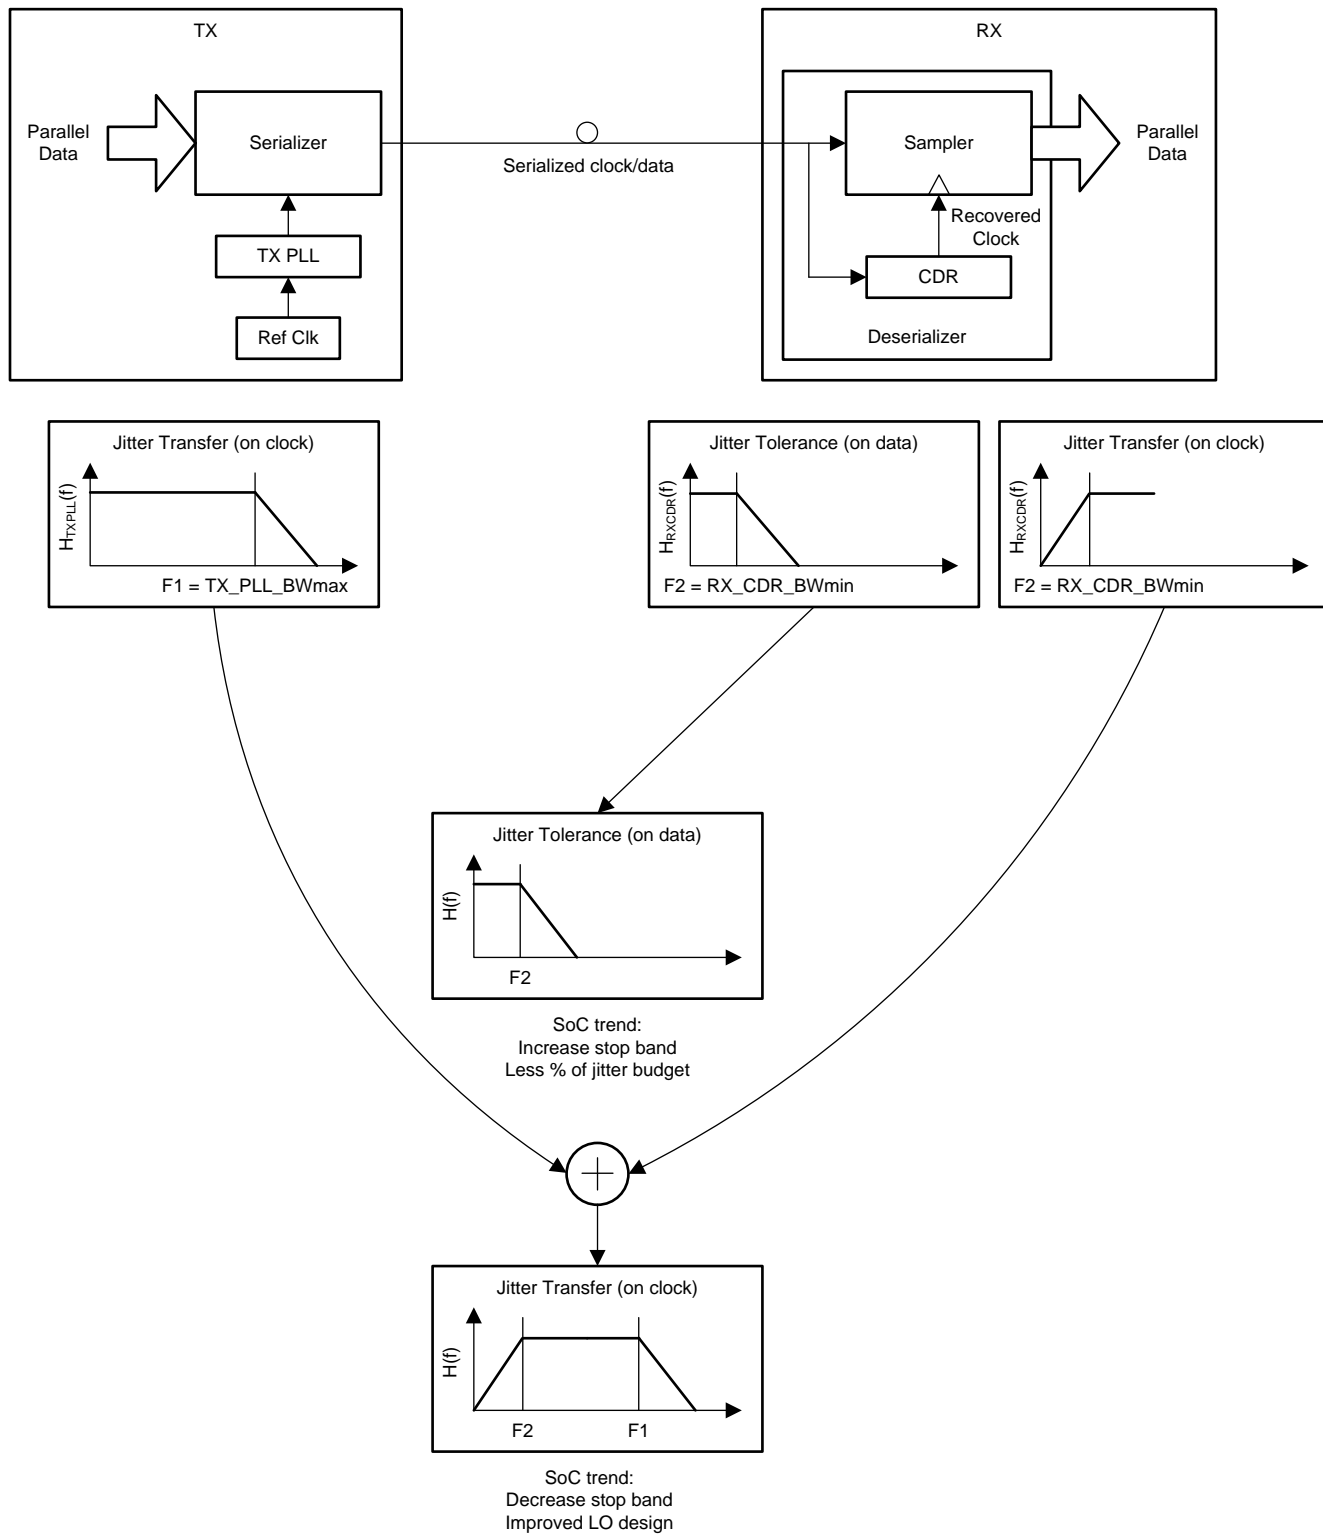

Figure 15. Dependence of Clock Jitter in Serial Links

11 Power Supply Recommendations

For best electrical performance of LMK61PD0A2, it is preferred to utilize a combination of 10 uF, 1 uF and 0.1 uF on its power supply bypass network. It is also recommended to utilize component side mounting of the power supply bypass capacitors and it is best to use 0201 or 0402 body size capacitors to facilitate signal routing. Keep the connections between the bypass capacitors and the power supply on the device as short as possible. Ground the other side of the capacitor using a low impedance connection to the ground plane. [Figure 16](#) shows the layout recommendation for power supply decoupling of LMK61PD0A2.

12 Layout

12.1 Layout Guidelines

The following sections provides recommendations for board layout, solder reflow profile and power supply bypassing when using LMK61PD0A2 to ensure good thermal / electrical performance and overall signal integrity of entire system.

12.1.1 Ensuring Thermal Reliability

The LMK61PD0A2 is a high performance device. Therefore careful attention must be paid to device configuration and printed circuit board (PCB) layout with respect to power consumption. The ground pin needs to be connected to the ground plane of the PCB through three vias or more, as shown in [Figure 16](#), to maximize thermal dissipation out of the package.

[Equation 1](#) describes the relationship between the PCB temperature around the LMK61PD0A2 and its junction temperature.

$$T_B = T_J - \Psi_{JB} * P$$

where

- T_B : PCB temperature around the LMK61PD0A2
 - T_J : Junction temperature of LMK61PD0A2
 - Ψ_{JB} : Junction-to-board thermal resistance parameter of LMK61PD0A2 (36.7°C/W without airflow)
 - P : On-chip power dissipation of LMK61PD0A2
- (1)

In order to ensure that the maximum junction temperature of LMK61PD0A2 is below 125°C, it can be calculated that the maximum PCB temperature without airflow should be at 100°C or below when the device is optimized for best performance resulting in maximum on-chip power dissipation of 0.68 W.

12.1.2 Best Practices for Signal Integrity

For best electrical performance and signal integrity of entire system with LMK61PD0A2, it is recommended to route vias into decoupling capacitors and then into the LMK61PD0A2. It is also recommended to increase the via count and width of the traces wherever possible. These steps ensure lowest impedance and shortest path for high frequency current flow. [Figure 16](#) shows the layout recommendation for LMK61PD0A2.

Figure 16. LMK61PD0A2 Layout Recommendation for Power Supply and Ground

Layout Guidelines (接下页)

12.1.3 Recommended Solder Reflow Profile

It is recommended to follow the solder paste supplier's recommendations to optimize flux activity and to achieve proper melting temperatures of the alloy within the guidelines of J-STD-20. It is preferable for the LMK61PD0A2 to be processed with the lowest peak temperature possible while also remaining below the components peak temperature rating as listed on the MSL label. The exact temperature profile would depend on several factors including maximum peak temperature for the component as rated on the MSL label, Board thickness, PCB material type, PCB geometries, component locations, sizes, densities within PCB, as well solder manufactures recommended profile, and capability of the reflow equipment to as confirmed by the SMT assembly operation.

Orderable Device	Status (1)	Package Type	Package Drawing	Pins	Package Qty	Eco Plan (2)	Lead finish/ Ball material (6)	MSL Peak Temp (3)	Op Temp (°C)	Device Marking (4/5)	Samples
LMK61PD0A2-SIAR	ACTIVE	QFM	SIA	8	2500	RoHS & Green	NIAU	Level-3-260C-168 HR	-40 to 85	LMK61 PD0A2	
LMK61PD0A2-SIAT	ACTIVE	QFM	SIA	8	250	RoHS & Green	NIAU	Level-3-260C-168 HR	-40 to 85	LMK61 PD0A2	

(1) The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSOLETE: TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

RoHS Exempt: TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

Green: TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

Important Information and Disclaimer:The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

TAPE AND REEL INFORMATION

QUADRANT ASSIGNMENTS FOR PIN 1 ORIENTATION IN TAPE

*All dimensions are nominal

Device	Package Type	Package Drawing	Pins	SPQ	Reel Diameter (mm)	Reel Width W1 (mm)	A0 (mm)	B0 (mm)	K0 (mm)	P1 (mm)	W (mm)	Pin1 Quadrant
LMK61PD0A2-SIAR	QFM	SIA	8	2500	330.0	16.4	5.5	7.5	1.5	8.0	16.0	Q1
LMK61PD0A2-SIAT	QFM	SIA	8	250	178.0	16.4	5.5	7.5	1.5	8.0	16.0	Q1

TAPE AND REEL BOX DIMENSIONS

*All dimensions are nominal

Device	Package Type	Package Drawing	Pins	SPQ	Length (mm)	Width (mm)	Height (mm)
LMK61PD0A2-SIAR	QFM	SIA	8	2500	356.0	356.0	35.0
LMK61PD0A2-SIAT	QFM	SIA	8	250	208.0	191.0	35.0

4221443/B 09/2015

NOTES:

1. All linear dimensions are in millimeters. Any dimensions in parenthesis are for reference only. Dimensioning and tolerancing per ASME Y14.5M.
2. This drawing is subject to change without notice.
