20-W STEREO DIGITAL AUDIO POWER AMPLIFIER WITH EQ/DRC and FEEDBACK

FEATURES

- **Audio Input/Output**
  - **20-W Into an 8-Ω Load From an 18-V Supply**
  - **Wide PVCC Range (10 V to 26 V); 3.3 V Digital Supply**
  - **Supports One Serial Audio Input (8 kHz - 48 kHz Sample Rates) (LJ/RJ/I²S)**
  - **Power-Stage Feedback Allows Operation From Poorly Regulated Power Supplies**
- **Audio/PWM Processing**
  - **Factory-Trimmed Internal Oscillator for Automatic Rate Detection**
  - **High-End 32-Bit Data Path Audio Processor**
  - **14 Biquads for Speaker EQ**
  - **Dynamic Range Control (DRC)**
- **Benefits**
  - **EQ: Speaker Equalization Improves Audio Performance**
  - **DRC: Enables Speaker Protection and Night-Mode Listening.**
  - **Autobank Switching: Preloaded Coefficients for Three Different Sample Rates Eliminates the Need to Update Coefficients When Sample Rate Changes**
  - **Autodetect: Automatically Detects Sample-Rate Changes Eliminating the Need for External Microprocessor Intervention**
  - **Closed-Loop Power Stage: Enables Wide PVCC Operating Range and Reduced Power Supply Ripple Distortion**

DESCRIPTION

The TAS5708 is a 20-W, efficient, digital audio power amplifier for driving stereo bridge-tied speakers. A 32-bit datapath eliminates the need for pre-scaling before processing and preserves signal integrity without sacrificing dynamic range. A digital audio processor with fully programmable digital filters allows designers to custom tune speakers for optimum sound in small enclosures. A programmable DRC can adjust power levels for a scaleable design while also enabling night-mode listening modes.

The closed-loop architecture allows the device to operate from poorly regulated supplies. Figure 1 below shows the benefit of the feedback architecture when a noisy supply (1kHz, 500mVpp ripple) modulates a 10kHz audio input. The figure shows a 40dB improvement in sideband suppression when compared to an open-loop design. This correlates directly to a 24dB improvement in distortion as seen in Figure 2.

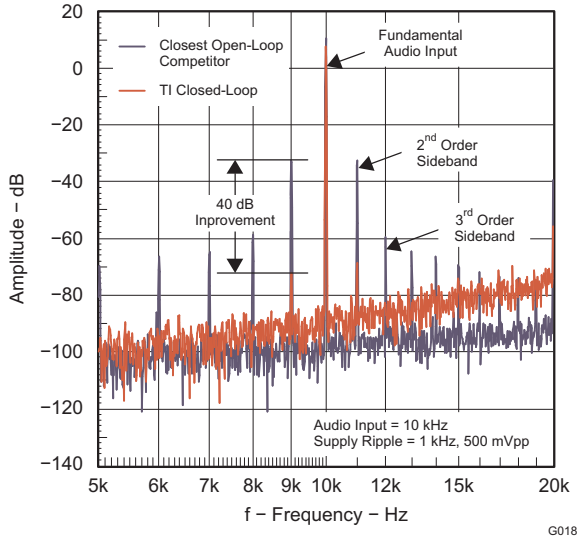

Figure 1. Supply Ripple Intermod Distortion

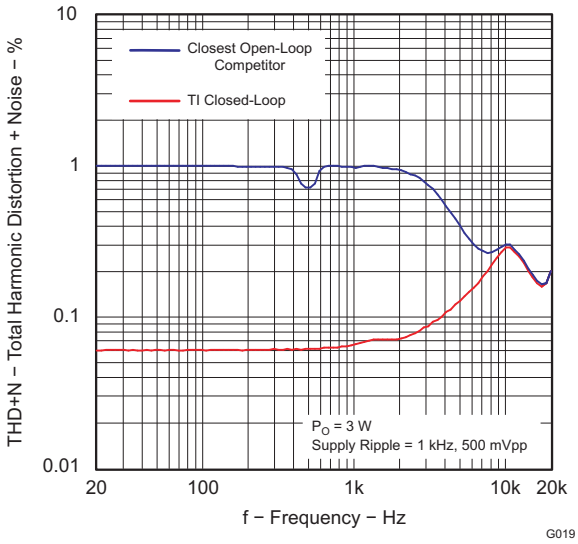

Figure 2. THD+N vs Frequency

These devices have limited built-in ESD protection. The leads should be shorted together or the device placed in conductive foam during storage or handling to prevent electrostatic damage to the MOS gates.

SIMPLIFIED APPLICATION DIAGRAM

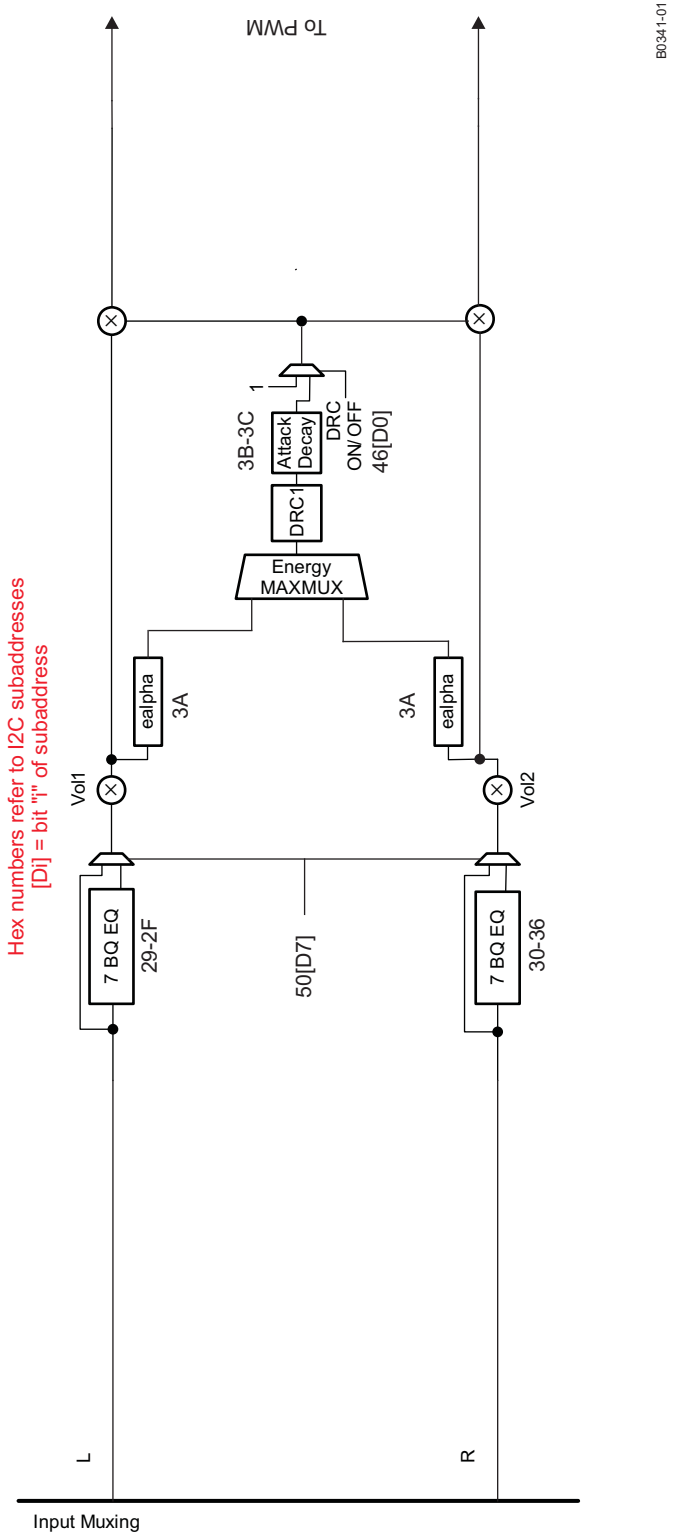
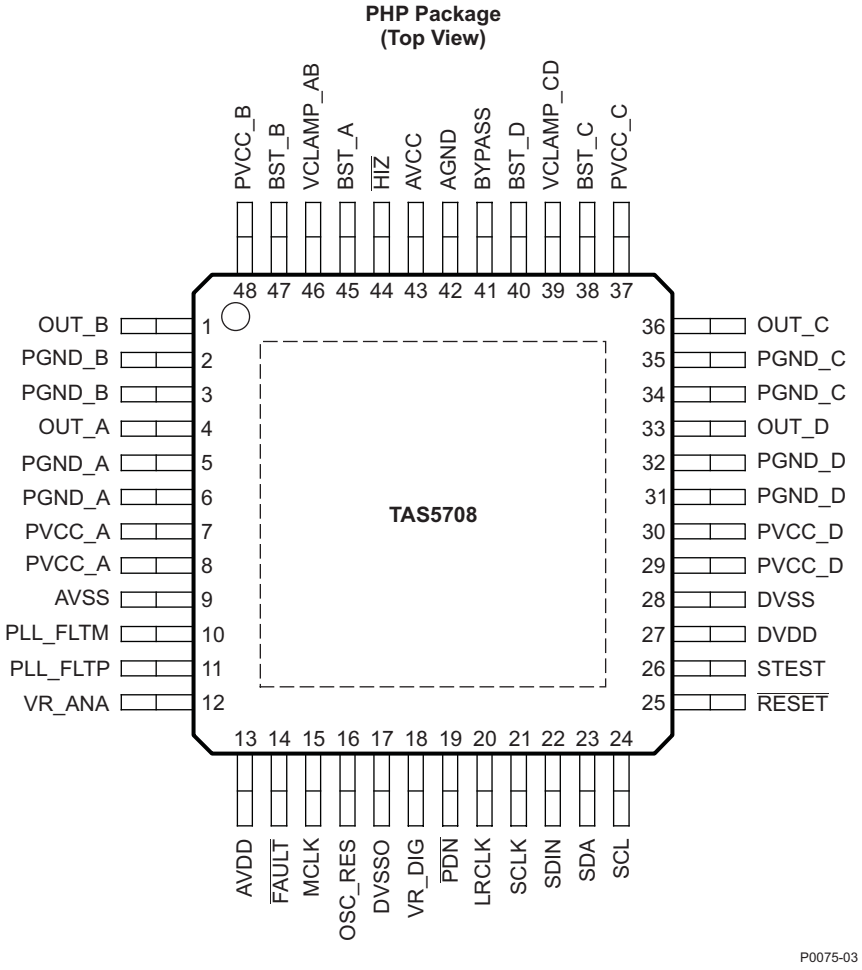
DAP Process Flow



48-PIN, HTQFP PACKAGE (TOP VIEW)



PIN FUNCTIONS

PIN		TYPE (1)	5-V TOLERANT	TERMINATION (2)	DESCRIPTION
NAME	NO.				
AGND	42	P			Analog ground for power stage
AVCC	43	P			Analog power supply for power stage. Connect externally to same potential as PVCC.
AVDD	13	P			3.3-V analog power supply
AVSS	9	P			Analog 3.3-V supply ground
BST_A	45	P			High-side bootstrap supply for half-bridge A
BST_B	47	P			High-side bootstrap supply for half-bridge B
BST_C	38	P			High-side bootstrap supply for half-bridge C
BST_D	40	P			High-side bootstrap supply for half-bridge D
BYPASS	41	AO			Nominally equal to V_{CC}/8. Internal reference voltage for analog cells
DVDD	27	P			3.3-V digital power supply
DVSS	28	P			Digital ground
DVSSO	17	P			Oscillator Ground
$\overline{HIZ}$	44	DI		Pullup	Enable high-impedance (Hi-Z) mode (active low)

(1) TYPE: A = analog; D = 3.3-V digital; P = power/ground/decoupling; I = input; O = output
(2) All pullups are weak pullups and all pulldowns are weak pulldowns. The pullups and pulldowns are included to assure proper input logic levels if the pins are left unconnected (pullups → logic 1 input; pulldowns → logic 0 input).

PIN FUNCTIONS (continued)

PIN		TYPE (1)	5-V TOLERANT	TERMINATION (2)	DESCRIPTION
NAME	NO.				
LRCLK	20	DI	5-V	Pulldown	Input serial audio data left/right clock (sample rate clock)
MCLK	15	DI	5-V	Pulldown	Master Clock Input
OSC_RES	16	AO			Oscillator trim resistor. Connect an 18.2-kΩ 1% resistor to DVSSO.
OUT_A	4	O			Output, half-bridge A
OUT_B	1	O			Output, half-bridge B
OUT_C	36	O			Output, half-bridge C
OUT_D	33	O			Output, half-bridge D
$\overline{\text{PDN}}$	19	DI	5-V	Pullup	Power down, active-low. $\overline{\text{PDN}}$ prepares the device for loss of power supplies by shutting down the Noise Shaper and initiating PWM stop sequence.
PGND_A	5, 6	P			Power ground for half-bridge A
PGND_B	2, 3	P			Power ground for half-bridge B
PGND_C	34, 35	P			Power ground for half-bridge C
PGND_D	31, 32	P			Power ground for half-bridge D
PLL_FLTM	10	AO			PLL negative loop filter terminal
PLL_FLTP	11	AO			PLL positive loop filter terminal
PVCC_A	7, 8	P			Power supply input for half-bridge output A
PVCC_B	48	P			Power supply input for half-bridge output B
PVCC_C	37	P			Power supply input for half-bridge output C
PVCC_D	29, 30	P			Power supply input for half-bridge output D
$\overline{\text{RESET}}$	25	DI	5-V	Pullup	Reset, active-low. A system reset is generated by applying a logic low to this pin. $\overline{\text{RESET}}$ is an asynchronous control signal that restores the DAP to its default conditions, and places the PWM in the hard mute state (tristated).
SCL	24	DI	5-V		I^2C serial control clock input
SCLK	21	DI	5-V	Pulldown	Serial audio data clock (shift clock). SCLK is the serial audio port input data bit clock.
SDA	23	DIO	5-V		I^2C serial control data interface input/output
SDIN	22	DI	5-V	Pulldown	Serial audio data input. SDIN supports three discrete (stereo) data formats.
STEST	26	DI			Factory test pin. Connect directly to DVSS.
$\overline{\text{FAULT}}$	14	DO			Backend error indicator. Asserted LOW for over current errors. De-asserted upon recovery from error condition.
VR_ANA	12	P			Internally regulated 1.8-V analog supply voltage. This pin must not be used to power external devices.
VR_DIG	18	P			Internally regulated 1.8-V digital supply voltage. This pin must not be used to power external devices.
VCLAMP_AB	46	AO			Internally generated voltage supply for channel A and B gate drive.This pin must not be used to power external devices.Connect only to external decoupling capacitor
VCLAMP_CD	39	AO			Internally generated voltage supply for channel C and D gate drive.This pin must not be used to power external devices.Connect only to external decoupling capacitor

ABSOLUTE MAXIMUM RATINGS

over operating free-air temperature range (unless otherwise noted) (1)(2)

		VALUE	UNIT
Supply voltage	DVDD, AVDD	–0.3 to 3.6	V
	PVCC_X, AVCC	–0.3 to 30	V
Input voltage	3.3-V digital inputs (except $\overline{HIZ}$)	–0.5 to DVDD + 0.5	V
	3.3-V $\overline{HIZ}$ input	–0.3 to AVDD + 0.3	V
	5-V tolerant(3) digital inputs (except MCLK)	–0.5 to DVDD + 2.5(2)	V
	5-V tolerant MCLK input	–0.5 to AVDD + 2.5(2)	V
OUT_x to PGND_X		32(4)	V
BST_x to PGND_X		43(4)	V
Operating free-air temperature		0 to 85	°C
Operating junction temperature range		0 to 150	°C
Storage temperature range, T_{stg}		–40 to 125	°C

(1) Stresses beyond those listed under *absolute ratings* may cause permanent damage to the device. These are stress ratings only and functional operation of the device at these or any other conditions beyond those indicated under *recommended operation conditions* are not implied. Exposure to absolute-maximum conditions for extended periods may affect device reliability.
(2) Maximum pin voltage should not exceed 6.0V
(3) 5-V tolerant inputs are $\overline{PDN}$, $\overline{RESET}$, SCLK, LRCLK, MCLK, SDIN, SDA, and SCL.
(4) DC voltage + peak ac waveform measured at the pin should be below the allowed limit for all conditions.

DISSIPATION RATINGS(1)

PACKAGE	DERATING FACTOR ABOVE T_A = 25°C	$T_A \le$ 25°C POWER RATING	T_A = 45°C POWER RATING	T_A = 70°C POWER RATING
7-mm × 7-mm HTQFP	40 mW/°C	5 W	4.2 W	3.2 W

(1) This data was taken using 1 oz trace and copper pad that is soldered directly to a JEDEC standard high-k PCB. The thermal pad must be soldered to a thermal land on the printed-circuit board. See TI Technical Briefs SLMA002 for more information about using the HTQFP thermal pad

RECOMMENDED OPERATING CONDITIONS

			MIN	NOM	MAX	UNIT
	Digital/analog supply voltage	DVDD, AVDD	3	3.3	3.6	V
	Half-bridge supply voltage	PVCC_X, AVCC	10		26	V
V_{IH}	High-level input voltage	Digital Inputs	2			V
V_{IL}	Low-level input voltage	Digital Inputs			0.8	V
T_A	Operating ambient temperature range		0		85	°C
T_J (1)	Operating junction temperature range		0		125	°C
R_L (BTL)	Load impedance	Output filter: L = 33 µH, C = 1 µF.	6	8		Ω
R_L (PBTL)	Load impedance	Output filter: L = 33 µH, C = 1 µF.	3.2	4		Ω
L_O (BTL)	Output-filter inductance	Minimum output inductance under short-circuit condition	10			µH
L_O (PBTL)	Output-filter inductance	Minimum output inductance under short-circuit condition	10			µH

(1) Continuous operation above the recommended junction temperature may result in reduced reliability and/or lifetime of the device.

PWM OPERATION AT RECOMMENDED OPERATING CONDITIONS

PARAMETER	TEST CONDITIONS	VALUE	UNIT
Output sample rate	11.025/22.05/44.1-kHz data rate ±2%	352.8	kHz

DETAILED DESCRIPTION

POWER SUPPLY

To facilitate system design, the TAS5708 needs only a 3.3-V supply in addition to the 10-V to 26-V power-stage supply. An internal voltage regulator provides suitable voltage levels for the gate drive circuitry. Additionally, all circuitry requiring a floating voltage supply, e.g., the high-side gate drive, is accommodated by built-in bootstrap circuitry requiring only a few external capacitors.

In order to provide good electrical and acoustical characteristics, the PWM signal path for the output stage is designed as identical, independent half-bridges. For this reason, each half-bridge has separate bootstrap pins (BST_X), and power-stage supply pins (PVCC_X). The gate drive voltages (VCLAMP_AB and VCLAMP_CD) are derived from the PVCC voltage. Special attention should be paid to placing all decoupling capacitors as close to their associated pins as possible. In general, inductance between the power-supply pins and decoupling capacitors must be avoided.

For a properly functioning bootstrap circuit, a small ceramic capacitor must be connected from each bootstrap pin (BST_X) to the power-stage output pin (OUT_X). When the power-stage output is low, the bootstrap capacitor is charged through an internal diode connected between the gate-drive regulator output pin (VCLAMP_X) and the bootstrap pin. When the power-stage output is high, the bootstrap capacitor potential is shifted above the output potential and thus provides a suitable voltage supply for the high-side gate driver. In an application with PWM switching frequencies in the range from 352 kHz to 384 kHz, it is recommended to use 220-nF ceramic capacitors, size 0603 or 0805, for the bootstrap supply. These 220-nF capacitors ensure sufficient energy storage, even during minimal PWM duty cycles, to keep the high-side power stage FET (LDMOS) fully turned on during the remaining part of the PWM cycle.

Special attention should be paid to the power-stage power supply; this includes component selection, PCB placement, and routing. As indicated, each half-bridge has independent power-stage supply pins (PVCC_X). For optimal electrical performance, EMI compliance, and system reliability, it is important that each PVCC_X pin is decoupled with a 100-nF ceramic capacitor placed as close as possible to each supply pin.

The TAS5708 is fully protected against erroneous power-stage turnon due to parasitic gate charging.

ERROR REPORTING

Any fault resulting in device shutdown is signaled by the $\overline{\text{FAULT}}$ pin going low (see Table 1). A sticky version of this pin is available on D1 of register 0X02.

Table 1. $\overline{\text{FAULT}}$ Output States

$\overline{\text{FAULT}}$	DESCRIPTION
0	Overcurrent (OC) ERROR
1	No faults (normal operation)

DEVICE PROTECTION SYSTEM

Overcurrent (OC) Protection

The device has independent, fast-reacting current detectors on all high-side and low-side power-stage FETs, which protects against shorts across the load, to GND, or to PVCC. The protection system triggers a latching shutdown, resulting in the power stage being set in the high-impedance (Hi-Z) state and $\overline{\text{FAULT}}$ being asserted low. The device returns to normal operation once the fault condition (i.e., a short circuit on the output) is removed. Current limiting and overcurrent protection are not independent for half-bridges. That is, if the bridge-tied load between half-bridges A and B causes an overcurrent fault, half-bridges A, B, C, and D are shut down.

Overtemperature Protection

The TAS5708 has an over-temperature protection system. If the device junction temperature exceeds 150°C (nominal), the device is put into thermal shutdown, resulting in all half-bridge outputs being set in the high-impedance (Hi-Z) state. The TAS5708 recovers automatically once the temperature drops approximately 15°.

Undervoltage Protection (UVP) and Overvoltage Protection (OVP)

THE UVP circuits of the TAS5708 fully protect the device in any power-up/down and brownout situation. The UVP engages if PVCC_X = AVCC drops below 8.4-V (typical) and disengages when PVCC_X = AVCC exceeds 8.5-V. The OVP circuits protect aganist voltage spikes and engage when PVCC_X = AVCC exceeds 27.5-V (typical). The OVP circuits disengage when PVCC_X = AVCC drops below 27.2-V. When the protection circuits engage, all half-bridge outputs are immediately placed in the high-impedance (Hi-Z) state.

SERIAL DATA INTERFACE

Serial data is input on SDIN. The PWM outputs are derived from SDIN. The TAS5708 DAP accepts serial data in 16-, 20-, or 24-bit left-justified, right-justified, and I^2S serial data formats.

CLOCK, AUTO DETECTION, and PLL

The TAS5708 is a slave device. It accepts MCLK, SCLK, and LRCLK. The digital audio processor (DAP) supports all the sample rates and MCLK rates that are defined in the clock control register.

The TAS5708 checks to verify that SCLK is a specific value of 32 f_S, 48 f_S, or 64 f_S. The DAP only supports a 1 × f_S LRCLK. The timing relationship of these clocks to SDIN is shown in subsequent sections. The clock section uses MCLK or the internal oscillator clock (when MCLK is unstable, out of range, or absent) to produce the internal clock (DCLK) running at 512 times the PWM switching frequency.

The DAP can autodetect and set the internal clock control logic to the appropriate settings for all supported clock rates as defined in the clock control register.

TAS5708 has robust clock error handling that uses the bulit-in trimmed oscillator clock to quickly detect changes/errors. Once the system detects a clock change/error, it will mute the audio (through a single step mute) and then force PLL to limp using the internal oscillator as a reference clock. Once the clocks are stable, the system will auto detect the new rate and revert to normal operation. During this process, the default volume will be restored in a single step (also called hard unmute). The ramp process can be programmed to ramp back slowly (also called soft unmute) as defined in volume register (0X0E).

PWM Section

The TAS5708 DAP device uses noise-shaping and sophisticated non-linear correction algorithms to achieve high power efficiency and high-performance digital audio reproduction. The DAP uses a fourth-order noise shaper to increase dynamic range and SNR in the audio band. The PWM section accepts 24-bit PCM data from the DAP and outputs two BTL PWM audio output channels.

The PWM section has individual channel dc blocking filters that can be enabled and disabled. The filter cutoff frequency is less than 1 Hz. Individual channel de-emphasis filters for 44.1- and 48-kHz are included and can be enabled and disabled.

Finally, the PWM section has an adjustable maximum modulation limit of 93.8% to 99.2%.

For detailed description of using audio processing features like DRC and EQ, please refer to User's Guide and TAS570X GDE software development tool documentation. Also refer to GDE software development tool for device data path.

I^2C COMPATIBLE SERIAL CONTROL INTERFACE

The TAS5708 DAP has an I^2C serial control slave interface to receive commands from a system controller. The serial control interface supports both normal-speed (100-kHz) and high-speed (400-kHz) operations without wait states. As an added feature, this interface operates even if MCLK is absent.

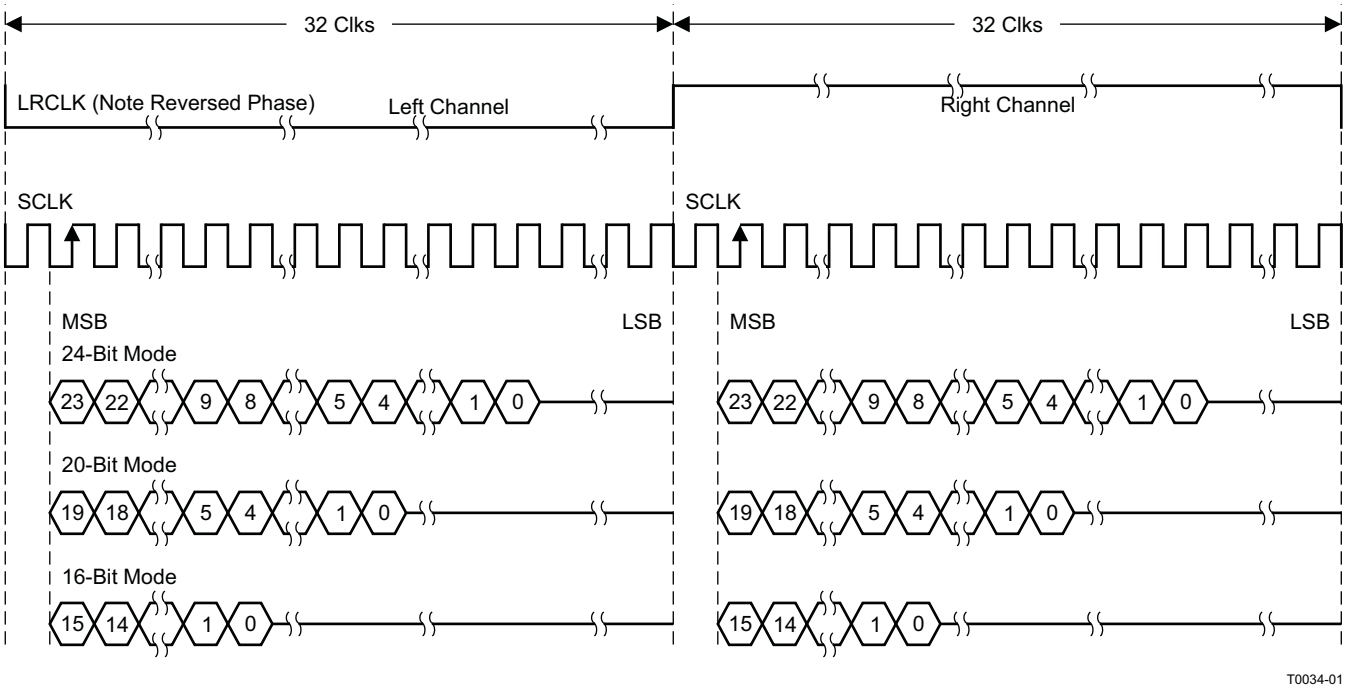
The serial control interface supports both single-byte and multi-byte read and write operations for status registers and the general control registers associated with the PWM.

SERIAL INTERFACE CONTROL AND TIMING

I^2S Timing

I^2S timing uses LRCLK to define when the data being transmitted is for the left channel and when it is for the right channel. LRCLK is low for the left channel and high for the right channel. A bit clock running at 32, 48, or 64 × f_S is used to clock in the data. There is a delay of one bit clock from the time the LRCLK signal changes state to the first bit of data on the data lines. The data is written MSB first and is valid on the rising edge of bit clock. The DAP masks unused trailing data bit positions.

2-Channel I²S (Philips Format) Stereo Input



NOTE: All data presented in 2s-complement form with MSB first.

Figure 18. I²S 64-f_S Format

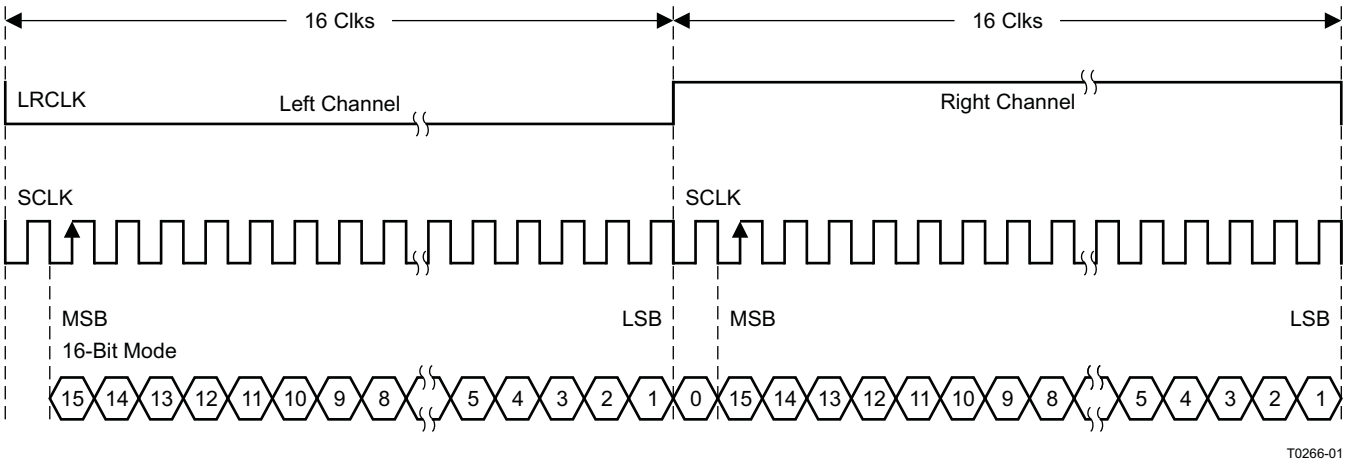
2-Channel I^{2}S (Philips Format) Stereo Input



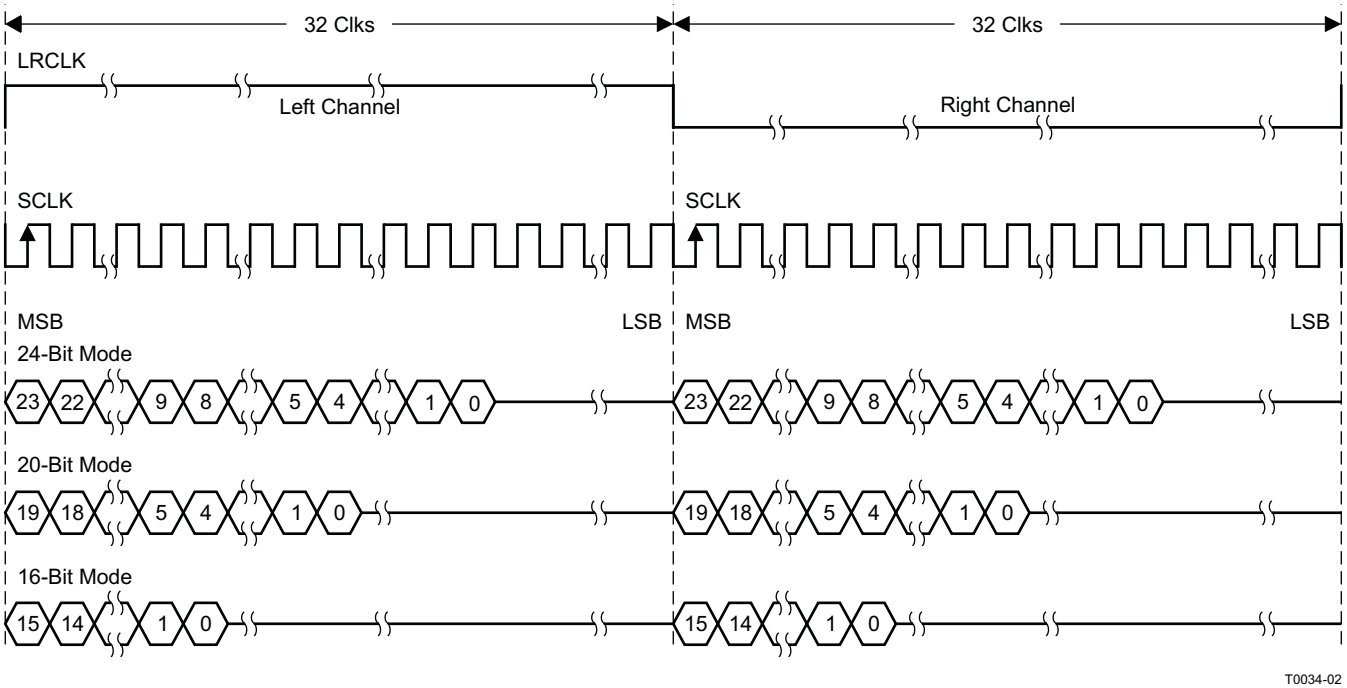
NOTE: All data presented in 2s-complement form with MSB first.

Figure 20. I^{2}S 32-f_S Format

Left-Justified

Left-justified (LJ) timing uses LRCLK to define when the data being transmitted is for the left channel and when it is for the right channel. LRCLK is high for the left channel and low for the right channel. A bit clock running at 32, 48, or 64 × f_S is used to clock in the data. The first bit of data appears on the data lines at the same time LRCLK toggles. The data is written MSB first and is valid on the rising edge of the bit clock. The DAP masks unused trailing data bit positions.

2-Channel Left-Justified Stereo Input



NOTE: All data presented in 2s-complement form with MSB first.

Figure 21. Left-Justified 64-f_S Format

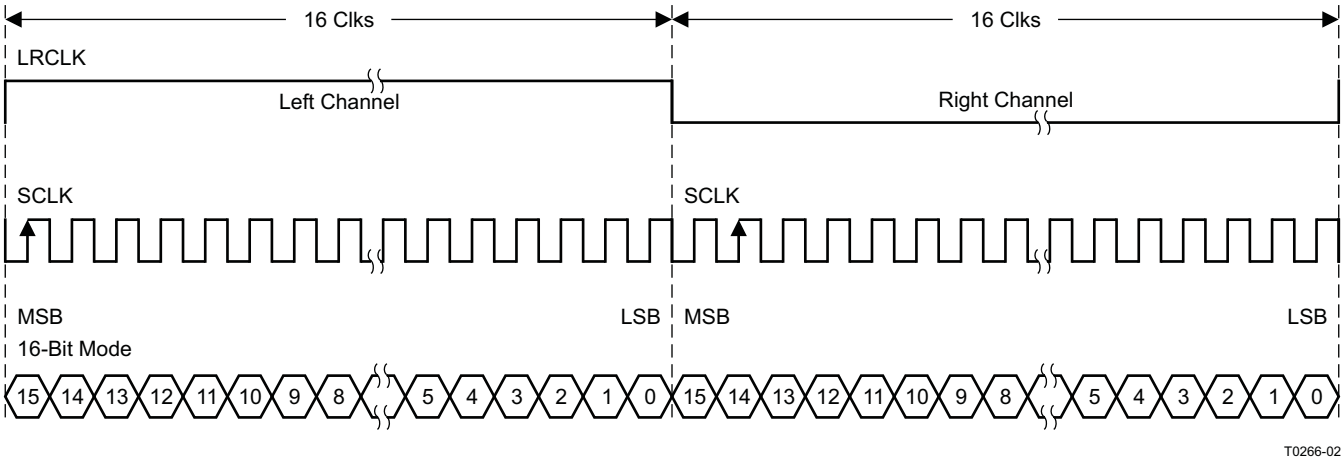
2-Channel Left-Justified Stereo Input



NOTE: All data presented in 2s-complement form with MSB first.

Figure 23. Left-Justified 32-f_S Format

Right-Justified

Right-justified (RJ) timing uses LRCLK to define when the data being transmitted is for the left channel and when

it is for the right channel. LRCLK is high for the left channel and low for the right channel. A bit clock running at 32, 48, or 64 × f_S is used to clock in the data. The first bit of data appears on the data 8 bit-clock periods (for 24-bit data) after LRCLK toggles. In RJ mode the LSB of data is always clocked by the last bit clock before LRCLK transitions. The data is written MSB first and is valid on the rising edge of bit clock. The DAP masks unused leading data bit positions.

I²C SERIAL CONTROL INTERFACE

The TAS5708 DAP has a bidirectional I²C interface that compatible with the I²C (Inter IC) bus protocol and supports both 100-kHz and 400-kHz data transfer rates for single and multiple byte write and read operations. This is a slave only device that does not support a multimaster bus environment or wait state insertion. The control interface is used to program the registers of the device and to read device status.

The DAP supports the standard-mode I²C bus operation (100 kHz maximum) and the fast I²C bus operation (400 kHz maximum). The DAP performs all I²C operations without I²C wait cycles.

General I²C Operation

The I²C bus employs two signals; SDA (data) and SCL (clock), to communicate between integrated circuits in a system. Data is transferred on the bus serially one bit at a time. The address and data can be transferred in byte (8-bit) format, with the most significant bit (MSB) transferred first. In addition, each byte transferred on the bus is acknowledged by the receiving device with an acknowledge bit. Each transfer operation begins with the master device driving a start condition on the bus and ends with the master device driving a stop condition on the bus. The bus uses transitions on the data pin (SDA) while the clock is high to indicate a start and stop conditions. A high-to-low transition on SDA indicates a start and a low-to-high transition indicates a stop. Normal data bit transitions must occur within the low time of the clock period. These conditions are shown in Figure 27. The master generates the 7-bit slave address and the read/write (R/$\overline{W}$) bit to open communication with another device and then waits for an acknowledge condition. The TAS5708 holds SDA low during the acknowledge clock period to indicate an acknowledgment. When this occurs, the master transmits the next byte of the sequence. Each device is addressed by a unique 7-bit slave address plus R/$\overline{W}$ bit (1 byte). All compatible devices share the same signals via a bidirectional bus using a wired-AND connection. An external pullup resistor must be used for the SDA and SCL signals to set the high level for the bus.

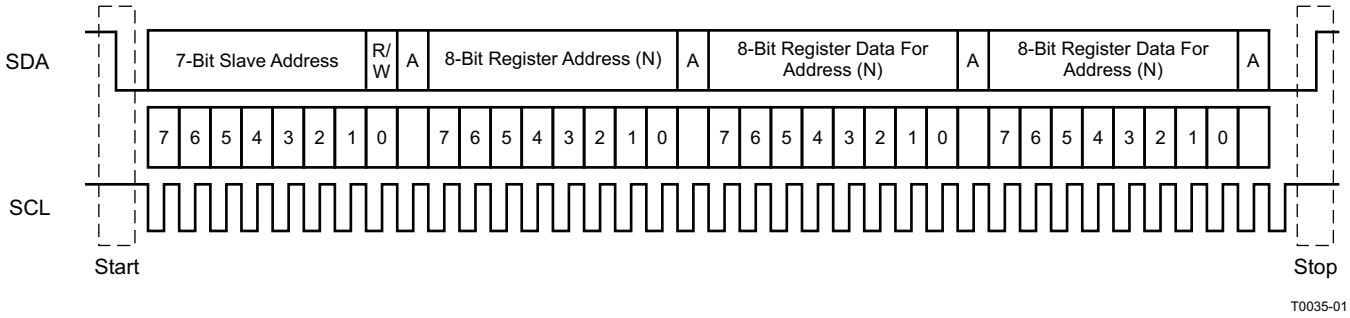

Figure 27. Typical I²C Sequence

There is no limit on the number of bytes that can be transmitted between start and stop conditions. When the last word transfers, the master generates a stop condition to release the bus. A generic data transfer sequence is shown in Figure 27.

The 7-bit address for TAS5708 is 0011 011 (0x36).

TAS5708 address can be changed from 0x36 to 0x38 by writing 0x38 to device address register 0xF9.

Single- and Multiple-Byte Transfers

The serial control interface supports both single-byte and multiple-byte read/write operations for subaddresses 0x00 to 0x1F. However, for the subaddresses 0x20 to 0xFF, the serial control interface supports only multiple-byte read/write operations (in multiples of 4 bytes).

During multiple-byte read operations, the DAP responds with data, a byte at a time, starting at the subaddress assigned, as long as the master device continues to respond with acknowledges. If a particular subaddress does not contain 32 bits, the unused bits are read as logic 0.

During multiple-byte write operations, the DAP compares the number of bytes transmitted to the number of bytes that are required for each specific subaddress. For example, if a write command is received for a biquad subaddress, the DAP expects to receive five 32-bit words. If fewer than five 32-bit data words have been received when a stop command (or another start command) is received, the data received is discarded.

Supplying a subaddress for each subaddress transaction is referred to as random I^2C addressing. The TAS5708 also supports sequential I^2C addressing. For write transactions, if a subaddress is issued followed by data for that subaddress and the 15 subaddresses that follow, a sequential I^2C write transaction has taken place, and the data for all 16 subaddresses is successfully received by the TAS5708. For I^2C sequential write transactions, the subaddress then serves as the start address, and the amount of data subsequently transmitted, before a stop or start is transmitted, determines how many subaddresses are written. As was true for random addressing, sequential addressing requires that a complete set of data be transmitted. If only a partial set of data is written to the last subaddress, the data for the last subaddress is discarded. However, all other data written is accepted; only the incomplete data is discarded.

Single-Byte Write

As shown in Figure 28, a single-byte data write transfer begins with the master device transmitting a start condition followed by the I^2C device address and the read/write bit. The read/write bit determines the direction of the data transfer. For a write data transfer, the read/write bit will be a 0. After receiving the correct I^2C device address and the read/write bit, the DAP responds with an acknowledge bit. Next, the master transmits the address byte or bytes corresponding to the TAS5708 internal memory address being accessed. After receiving the address byte, the TAS5708 again responds with an acknowledge bit. Next, the master device transmits the data byte to be written to the memory address being accessed. After receiving the data byte, the TAS5708 again responds with an acknowledge bit. Finally, the master device transmits a stop condition to complete the single-byte data write transfer.

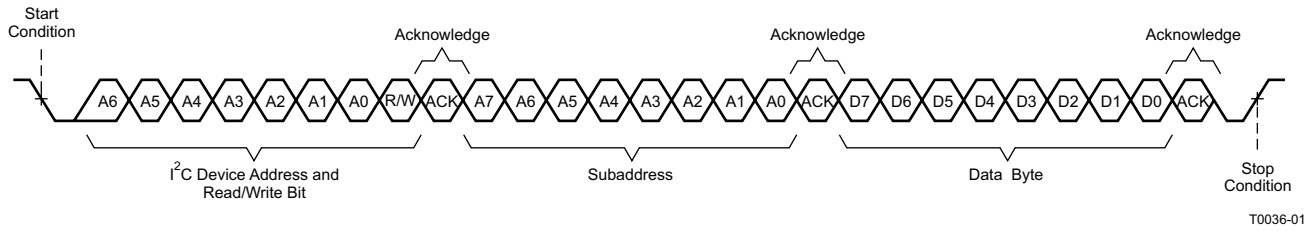

Figure 28. Single-Byte Write Transfer

Multiple-Byte Write

A multiple-byte data write transfer is identical to a single-byte data write transfer except that multiple data bytes are transmitted by the master device to the DAP as shown in Figure 29. After receiving each data byte, the TAS5708 responds with an acknowledge bit.

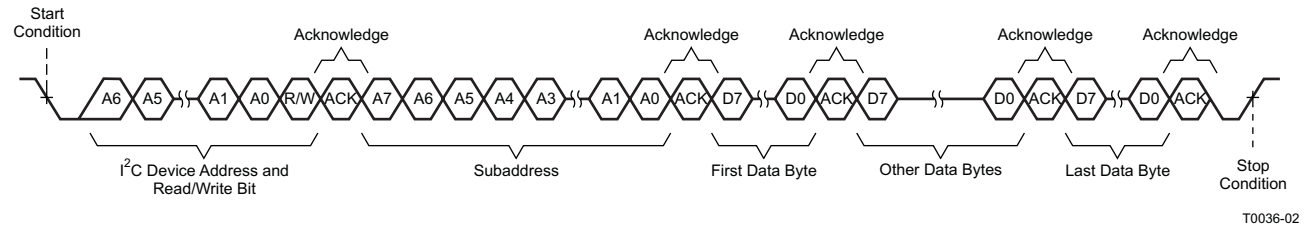

Figure 29. Multiple-Byte Write Transfer

Single-Byte Read

As shown in Figure 30, a single-byte data read transfer begins with the master device transmitting a start condition followed by the I^2C device address and the read/write bit. For the data read transfer, both a write followed by a read are actually done. Initially, a write is done to transfer the address byte or bytes of the internal memory address to be read. As a result, the read/write bit becomes a 0. After receiving the TAS5708 address and the read/write bit, TAS5708 responds with an acknowledge bit. In addition, after sending the internal memory address byte or bytes, the master device transmits another start condition followed by the TAS5708 address and the read/write bit again. This time the read/write bit becomes a 1, indicating a read transfer. After receiving the address and the read/write bit, the TAS5708 again responds with an acknowledge bit. Next, the TAS5708 transmits the data byte from the memory address being read. After receiving the data byte, the master device transmits a not acknowledge followed by a stop condition to complete the single byte data read transfer.

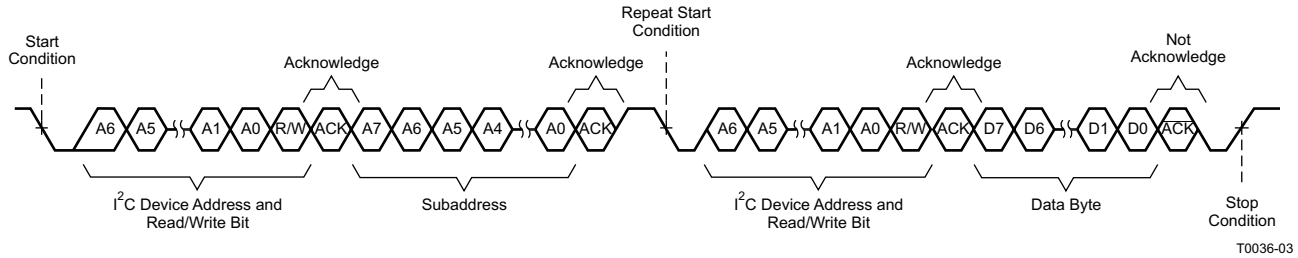

Figure 30. Single-Byte Read Transfer

Multiple-Byte Read

A multiple-byte data read transfer is identical to a single-byte data read transfer except that multiple data bytes are transmitted by the TAS5708 to the master device as shown in Figure 31. Except for the last data byte, the master device responds with an acknowledge bit after receiving each data byte.

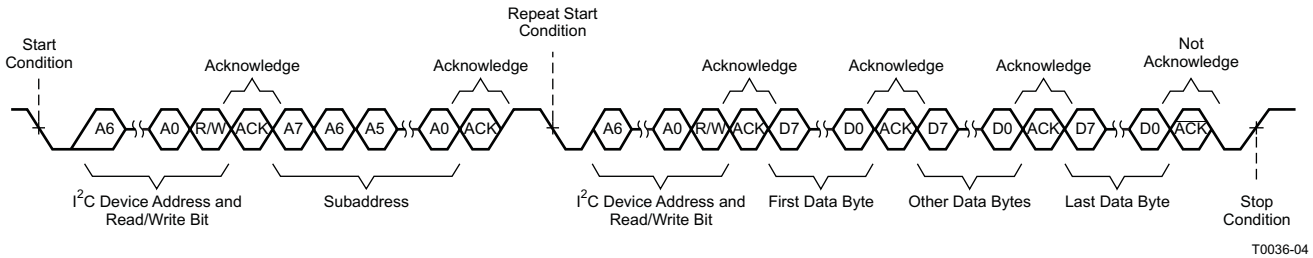

Figure 31. Multiple Byte Read Transfer

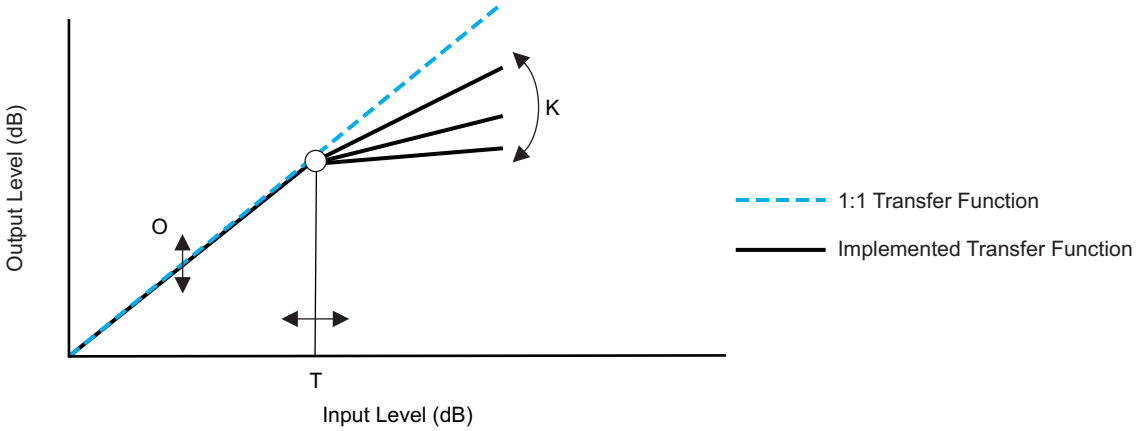
Dynamic Range Control (DRC)

The DRC scheme has a single threshold, offset, and slope (all programmable). There is one ganged DRC for the left/right channels.

The DRC input/output diagram is shown in Figure 32.

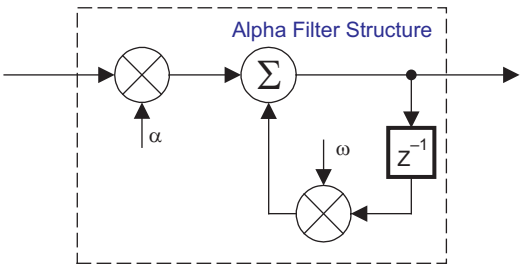


Professional-quality dynamic range compression automatically adjusts volume to flatten volume level.

- One DRC for left/right
- The DRC has adjustable threshold, offset, and compression levels
- Programmable energy, attack, and decay time constants
- *Transparent compression*: compressors can attack fast enough to avoid apparent clipping before engaging, and decay times can be set slow enough to avoid pumping.

Figure 32. Dynamic Range Control

	α, ω	T, K, O	α_a, ω_a / α_d, ω_d
DRC	0x3A	0x40, 0x41, 0x42	0x3B / 0x3C



NOTE:
$\omega = 1 - \alpha$

Figure 33. DRC Structure

BiQuad Structure

All biquads use a 2nd order IIR filter structure as shown below. Each biquad has 3 coefficients on the direct path (b_0,b_1,b_2) and 2 coefficients on feedback path (a_1 and a_2) as shown in the diagram.

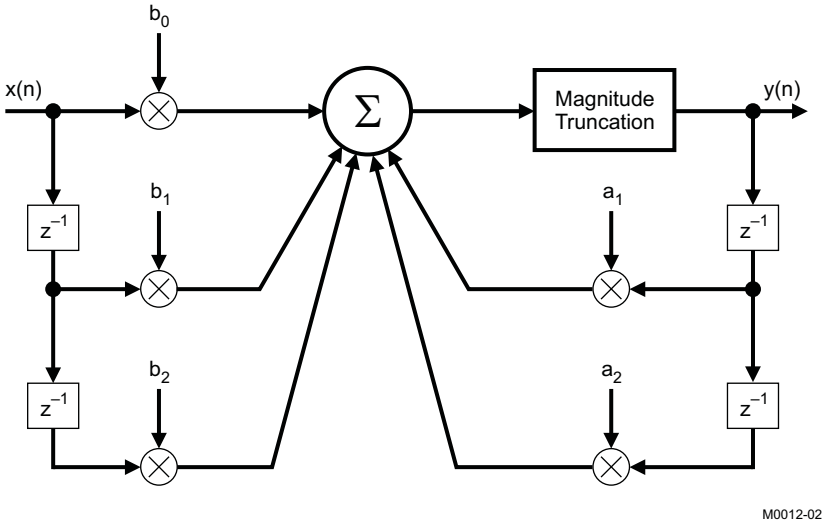


Figure 34. Biquad Filter

BANK SWITCHING

The TAS5708 uses an approach called *bank switching* together with automatic sample-rate detection. All processing features that must be changed for different sample rates are stored internally in three banks. The user can program which sample rates map to each bank. By default, bank 1 is used in 32kHz mode, bank 2 is used in 44.1/48 kHz mode, and bank 3 is used for all other rates. Combined with the clock-rate autodetection feature, bank switching allows the TAS5708 to detect automatically a change in the input sample rate and switch to the appropriate bank without any MCU intervention.

An external controller configures bankable locations (0x29-0x36 and 0x3A-0x3C) for all three banks during the initialization sequence.

If auto bank switching is enabled (register 0x50, bits 2:0) , then the TAS5708 automatically swaps the coefficients for subsequent sample rate changes, avoiding the need for any external controller intervention for a sample rate change.

By default, bits 2:0 have the value 000; indicating that bank switching is disabled. In that state, updates to bankable locations take immediate effect. A write to register 0x50 with bits 2:0 being 001, 010, or 011 brings the system into the coefficient-bank-update state *update bank1*, *update bank2,* or *update bank3*, respectively. Any subsequent write to bankable locations updates the coefficient banks stored outside the DAP. After updating all the three banks, the system controller should issue a write to register 0x50 with bits 2:0 being 100; this changes the system state to automatic bank switching mode. In automatic bank switching mode, the TAS5708 automatically swaps banks based on the sample rate.

Command sequences for updating DAP coefficients can be summarized as follows:

1. **Bank switching disabled (default):** DAP coefficient writes take immediate effect and are not influenced by subsequent sample rate changes.

   OR

   Bank switching enabled:
   a. Update bank-1 mode: Write "001" to bits 2:0 of reg 0x50. Load the 32 kHz coefficients.
   b. Update bank-2 mode: Write "010" to bits 2:0 of reg 0x50. Load the 48 kHz coefficients.
   c. Update bank-3 mode: Write "011" to bits 2:0 of reg 0x50. Load the other coefficients.
   d. Enable automatic bank switching by writing "100" to bits 2:0 of reg 0x50.

26-Bit 3.23 Number Format

All mixer gain coefficients are 26-bit coefficients using a 3.23 number format. Numbers formatted as 3.23 numbers means that there are 3 bits to the left of the decimal point and 23 bits to the right of the decimal point. This is shown in Figure 35 .

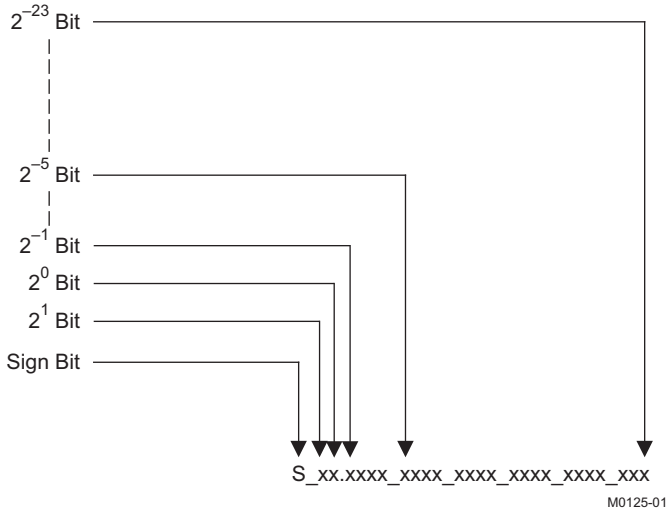

Figure 35. 3.23 Format

The decimal value of a 3.23 format number can be found by following the weighting shown in Figure 35. If the most significant bit is logic 0, the number is a positive number, and the weighting shown yields the correct number. If the most significant bit is a logic 1, then the number is a negative number. In this case every bit must be inverted, a 1 added to the result, and then the weighting shown in Figure 36 applied to obtain the magnitude of the negative number.

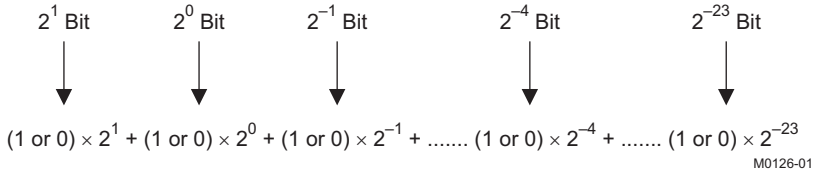

Figure 36. Conversion Weighting Factors—3.23 Format to Floating Point

Gain coefficients, entered via the I2C bus, must be entered as 32-bit binary numbers. The format of the 32-bit number (4-byte or 8-digit hexadecimal number) is shown in Figure 37

APPLICATION INFORMATION

Calculation of Output Signal Level of TAS5708 Feedback Power Stage (Gain Is independent of PVCC)

The gain of the TAS5708 is the total digital gain of the controller multiplied by the gain of the power stage.

For a half-bridge channel of the TAS5708 power stage, the gain is simply:

Power stage gain = 13 × V_{RMS} / Modulation Level

Modulation level = fraction of full-scale modulation of the PWM signal at the input of the power stage.

V_{RMS}(SE) = Audio voltage level at the output of the power stage = 13 × Modulation Level

V_{RMS}(BTL) = 2 × Audio voltage level at the output of the power stage = 26 × Modulation Level

For the TAS5708 controller, the gain is the programmed digital gain multiplied by a scaling factor, called the *maximum modulation level*. The maximum modulation level is derived from the modulation limit programmed in the controller, which limits duty cycle to a set number of percent above 0% and below 100%. Setting the modulation limit to 97.7% (default) limits the duty cycle between 2.3% and 97.7%.

Controller gain = digital gain × maximum modulation level × (modulation level/digital FFS)

Digital FFS = digital input fraction of full scale

Modulation limit = 97.7%

Maximum modulation level = 2 × modulation limit – 1 = 0.954

The output signal level of the TAS5708 can now be calculated:

$V_{RMS(SE)}$ = digital FFS × digital gain × maximum modulation level × 13

$V_{RMS(BTL)}$ = 2 × $V_{RMS(SE)}$

With the modulation limit set at the default level of 97.7%, this becomes:

V_{RMS} (BTL) = digital FFS × digital gain × 24.8

Example: Input = –20 dbFS; volume = 0 dB; biquads = ALL PASS; modulation index = 97.7%; mode = BTL

Output V_{RMS} (BTL) = 24.8 × 0.1 × 1 = 2.48 V.

Recommended Use Model

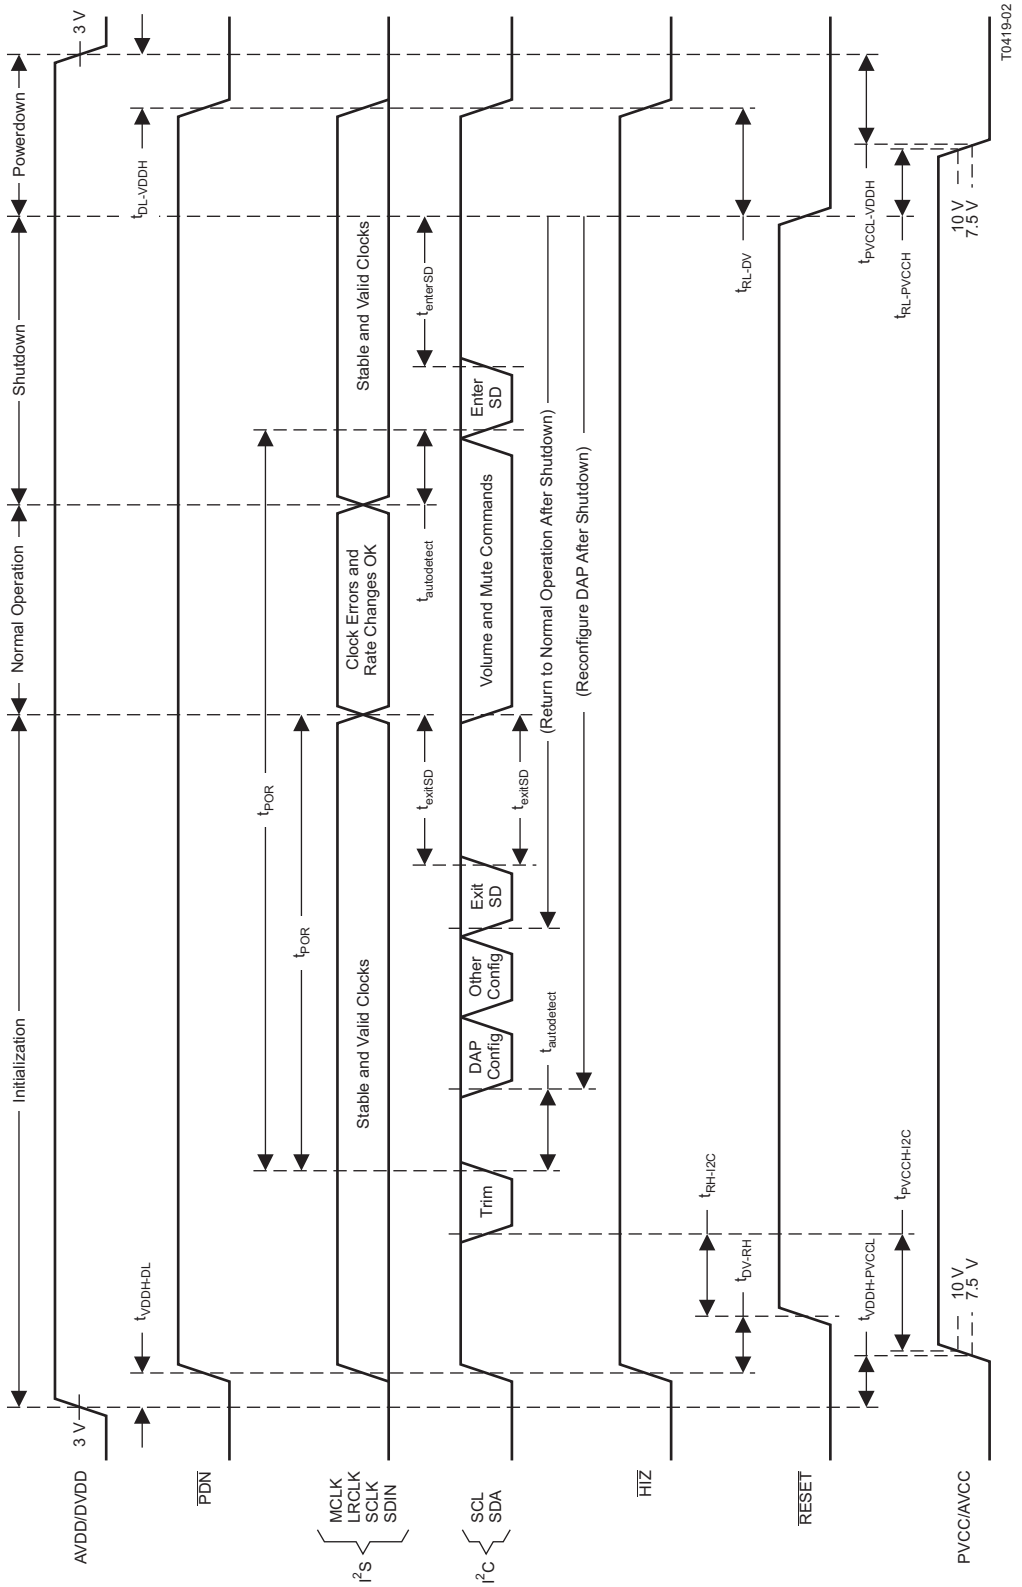

Figure 38. Recommended Command Sequence

PARAMETER	DESCRIPTION	MIN	TYP	MAX	UNIT
$t_{VDDH-DL}$	Time digital inputs must remain low after AVDD/DVDD goes above 3V	0			µs
$t_{DL-VDDH}$	Time digital inputs must be low before AVDD/DVDD goes below 3V	0			µs
$t_{VDDH-PVCCL}$	Time PVCC/AVCC remains below 7.5V after AVDD/DVDD goes above 3V	100			µs
$t_{PVCCL-VDDH}$	Time PVCC/AVCC must be below 7.5V before AVDD/DVDD goes below 3V	0			µs
$t_{PVCCH-I2C}$	Time PVCC/AVCC must be above 10V before I2C commands may address device	10			µs
$t_{RL-PVCCH}$	Time PVCC/AVCC must remain above 10V after $\overline{\text{RESET}}$ goes low	2			µs
t_{RH-I2C}	Time $\overline{\text{RESET}}$ must be high before I2C commands may address device	13.5			ms
t_{DV-RH}	Time digital inputs must be valid (driven as recommended) before $\overline{\text{RESET}}$ goes high	100			µs
t_{RL-DV}	Time digital inputs must remain valid (driven as recommended) after $\overline{\text{RESET}}$ goes low	2			µs
$t_{autodetect}$	Autodetect completion wait time (given stable and valid clocks) before issuing further commands	50			ms
t_{exitSD}	Exit shutdown wait time before issuing further commands to device (t_{start} given by register 0x1A)	$1+1.3*t_{start}$			ms
$t_{enterSD}$	Enter shutdown wait time before issuing further commands to device (t_{stop} given by register 0x1A)	$1+1.3*t_{stop}$			ms
t_{POR}	Power-on-reset wait time after 1st trim following AVDD/DVDD power-up (t_{start} given by register 0x1A) (does not apply to trim commands following subsequent resets)	$240+1.3*t_{start}$			ms

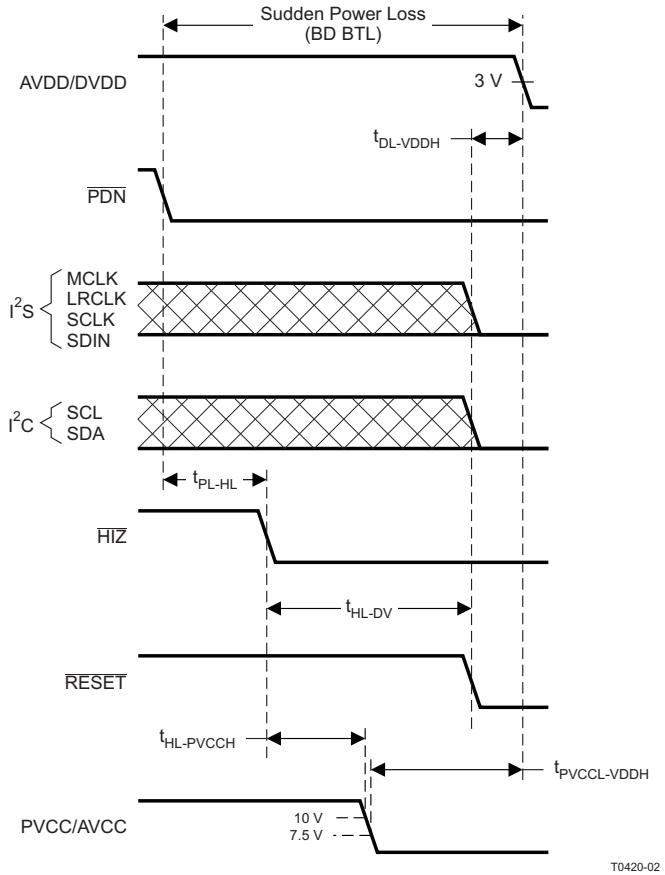

Figure 39. BD BTL Power Loss Sequence

PARAMETER	DESCRIPTION	MIN	TYP	MAX	UNIT
t_{PL-HL}	Time $\overline{HIZ}$ must remain high after $\overline{PDN}$ goes low	2			ms
t_{HL-RL}	Time $\overline{RESET}$ must remain high after $\overline{HIZ}$ goes low	4			µs
t_{HL-DV}	Time digital inputs must remain valid (driven as recommended) after $\overline{HIZ}$ goes low	4			µs
t_{RL-DV}	Time digital inputs must remain valid (driven as recommended) after $\overline{RESET}$ goes low	2			µs
$t_{DL-VDDH}$	Time digital inputs must be low before AVDD/DVDD goes below 3V	0			µs
$t_{HL-PVCCH}$	Time PVCC/AVCC must remain above 10V after $\overline{HIZ}$ goes low	4			µs
$t_{RL-PVCCH}$	Time PVCC/AVCC must remain above 10V after $\overline{RESET}$ goes low	2			µs
$t_{PVCCL-VDDH}$	Time PVCC/AVCC must be below 7.5V before AVDD/DVDD goes below 3V	0			µs

Recommended Command Sequences

The DAP has two groups of commands. One set is for configuration and is intended for use only during initialization. The other set has built-in click and pop protection and may be used during normal operation while audio is streaming. The following supported command sequences illustrate how to initialize, operate, and shutdown the device.

Initialization Sequence

Use the following sequence to power-up and initialize the device:

1. Hold all digital inputs low and ramp up AVDD/DVDD to at least 3V.
2. Initialize digital inputs and PVCC/AVCC supply as follows:
   - Drive $\overline{RESET}$=0, $\overline{PDN}$=1, $\overline{HIZ}$=1, and other digital inputs to their desired state, observing absolute maximum ratings relative to AVDD/DVDD. Provide stable and valid I2S clocks (MCLK, LRCLK, and SCLK). Wait at least 100us, drive $\overline{RESET}$=1, and wait at least another 13.5ms.
   - Ramp up PVCC/AVCC to at least 10V while ensuring it remains below 7.5V for at least 100us after AVDD/DVDD reaches 3V. Then wait at least another 10us.
3. Trim oscillator (write 0x00 to register 0x1B) and wait at least 50ms.
4. Configure the DAP via I2C (see Users's Guide for typical values):

   Biquads (0x29-36)

   DRC parameters (0x3A-3C, 0x40-42, and 0x46)

   Bank select (0x50)
5. Configure remaining registers
6. Exit shutdown (sequence defined below).

Normal Operation

The following are the only events supported during normal operation:

(a) Writes to master/channel volume registers

(b) Writes to soft mute register

(c) Enter and exit shutdown (sequence defined below)

(d) Clock errors and rate changes

Note: Events (c) and (d) are not supported for 240ms+1.3*t_{start} after trim following AVDD/DVDD powerup ramp (where t_{start} is specified by register 0x1A).

Shutdown Sequence

Enter:

1. Ensure I2S clocks have been stable and valid for at least 50ms.

2. Write 0x40 to register 0x05.
3. Wait at least 1ms+1.3*t_{stop} (where t_{stop} is specified by register 0x1A).
4. Once in shutdown, stable clocks are not required while device remains idle.
5. If desired, reconfigure by ensuring that clocks have been stable and valid for at least 50ms before returning to step 4 of initialization sequence.

Exit:

1. Ensure I2S clocks have been stable and valid for at least 50ms.
2. Write 0x00 to register 0x05 (exit shutdown command may not be serviced for as much as 240ms after trim following AVDD/DVDD powerup ramp).
3. Wait at least 1ms+1.3*t_{start} (where t_{start} is specified by register 0x1A).
4. Proceed with normal operation.

Controlled Powerdown Sequence

Use the following sequence to powerdown the device and its supplies when time permits a controlled shutdown:

1. Enter shutdown (sequence defined above).
2. Assert $\overline{\text{RESET}}$=0.
3. Drive digital inputs low and ramp down PVCC/AVCC supply as follows:
   - Drive all digital inputs low after $\overline{\text{RESET}}$ has been low for at least 2us.
   - Ramp down PVCC/AVCC while ensuring that it remains above 10V until $\overline{\text{RESET}}$ has been low for at least 2us.
4. Ramp down AVDD/DVDD while ensuring that it remains above 3V until PVCC/AVCC is below 7.5V and observing absolute maximum ratings for digital inputs.

Power Loss Sequence (BD BTL)

Use the following sequence to powerdown a BD BTL device and its supplies in case of sudden power loss when time does not permit a controlled shutdown:

1. Assert $\overline{\text{PDN}}$ = 0 and wait at least 2ms.
2. Assert $\overline{\text{HIZ}}$ = 0.
3. Drive digital inputs low and ramp down PVCC/AVCC supply as follows:
   - Drive all digital inputs low after $\overline{\text{HIZ}}$ has been low for at least 4µs.
   - Ramp down PVCC/AVCC while ensuring that it remains above 10V until $\overline{\text{HIZ}}$ has been low for at least 4µs.
4. Ramp down AVDD/DVDD while ensuring that it remains above 3V until PVCC/AVCC is below 7.5V and observing absolute maximum ratings for digital inputs.

Power Loss Sequence (AD BTL)

Use the following sequence to powerdown an AD BTL device and its supplies in case of sudden power loss when time does not permit a controlled shutdown:

1. Assert $\overline{\text{PDN}}$ = 0 and wait at least 2ms then assert $\overline{\text{HIZ}}$ = 0 and wait at least 4µs.
2. Assert $\overline{\text{RESET}}$ = 0.
3. Drive digital inputs low and ramp down PVCC/AVCC supply as follows:
   - Drive all digital inputs low after $\overline{\text{RESET}}$ has been low for at least 2µs.
   - Ramp down PVCC/AVCC while ensuring that it remains above 10V until $\overline{\text{RESET}}$ has been low for at least 2µs.

4. Ramp down AVDD/DVDD while ensuring that it remains above 3V until PVCC/AVCC is below 7.5V and observing absolute maximum ratings for digital inputs.

(3) Reserved registers should not be accessed.
(4) "ae" stands for ∝ of energy filter, "aa" stands for ∝ of attack filter and "ad" stands for ∝ of decay filter and 1- ∝ = ω.

Note: All DAP coefficients are 3.23 format unless specified otherwise

CLOCK CONTROL REGISTER (0x00)

The clocks and data rates are automatically determined by the TAS5708. The clock control register contains the auto-detected clock status. Bits D7–D5 reflect the sample rate. Bits D4–D2 reflect the MCLK frequency.TAS5708 accepts a 64 Fs or 32 Fs SCLK rate for all MCLK ratios, but accepts a 48Fs SCLK rate only for MCLK ratios of 192 Fs and 384 Fs.

Table 3. Clock Control Register (0x00)

–	**–**	**–**	–	**–**	**–**	**–**	**0**	Reserved(1)

(1) Reserved registers should not be accessed.
(2) Default values are in **bold**.
(3) Only available for 44.1 kHz and 48 kHz rates.
(4) Rate only available for 32/44.1/48 KHz sample rates
(5) Not available at 8 kHz

DEVICE ID REGISTER (0x01)

The device ID register contains the ID code for the firmware revision.

Table 4. General Status Register (0x01)

X	–	–	–	–	–	–	–	Reserved
–	**1**	**1**	**0**	**1**	**0**	**0**	**0**	**Identification code**

ERROR STATUS REGISTER (0x02)

The error bits are sticky and are not cleared by the hardware. This means that the software must clear the register (write zeroes) and then read them to determine if they are persistent errors.

Error Definitions:

- MCLK Error : MCLK frequency is changing. The number of MCLKs per LRCLK is changing.
- SCLK Error: The number of SCLKs per LRCLK is changing.
- LRCLK Error: LRCLK frequency is changing.
- Frame Slip: LRCLK phase is drifting with respect to internal Frame Sync.

Table 5. Error Status Register (0x02)

(1) Default values are in **bold**.

SYSTEM CONTROL REGISTER 1 (0x03)

The system control register 1 has several functions:

Bit D7: If 0, the dc-blocking filter for each channel is disabled.
If 1, the dc-blocking filter (–3 dB cutoff <1 Hz) for each channel is enabled (default).

Bit D5: If 0, use soft unmute on recovery from clock error. This is a slow recovery. Unmute takes same time as volume ramp defined in reg 0X0E.
If 1, use hard unmute on recovery from clock error (default). This is a fast recovery, a single step volume ramp

Bits D1–D0: Select de-emphasis

Table 6. System Control Register 1 (0x03)

D7	D6	D5	D4	D3	D2	D1	D0	FUNCTION
0	–	–	–	–	–	–	–	PWM high-pass (dc blocking) disabled

–	–	–	–	–	–	1	1	De-emphasis for f_S = 48 kHz

(1) Default values are in **bold**.

SERIAL DATA INTERFACE REGISTER (0x04)

As shown in Table 7, the TAS5708 supports 9 serial data modes. The default is 24-bit, I^2S mode,

Table 7. Serial Data Interface Control Register (0x04) Format

RECEIVE SERIAL DATA INTERFACE FORMAT	WORD LENGTH	D7–D4	D3	D2	D1	D0

(1) Default values are in **bold**.

MASTER FINE VOLUME REGISTER (0x0A)

This register can be used to provide precision tuning of master volume.

Table 11. Master Fine Volume Register (0x0A)

D7	D6	D5	D4	D3	D2	D1	D0	FUNCTION
–	–	–	–	–	–	**0**	**0**	**0 dB** (1)
–	–	–	–	–	–	0	1	0.125 dB
–	–	–	–	–	–	1	0	0.25 dB
–	–	–	–	–	–	1	1	0.375 dB
1	–	–	–	–	–	–	–	Write enable bit
0	–	–	–	–	–	–	–	**Ignore Write to register 0X0A**

(1) Default values are in **bold**.

VOLUME CONFIGURATION REGISTER (0x0E)

Bits D2–D0: Volume slew rate (Used to control volume change and MUTE ramp rates). These bits control the number of steps in a volume ramp.Volume steps occur at a rate that depends on the sample rate of the I2S data as follows

Sample Rate (KHz)	Approximate Ramp Rate
8/16/32	125 us/step
11.025/22.05/44.1	90.7 us/step
12/24/48	83.3 us/step

Table 12. Volume Control Register (0x0E)

(1) Default values are in **bold**.

ICD settings have high impact on audio performance (eg: Dynamic Range, THD, Cross talk etc.) Therefore, appropriate ICD settings must be used. By default device has ICD settings for BD mode.If used in AD mode, then update these registers before coming out of all channel shutdown. Contact factory for AD Mode ICD settings.

MODE	BD MODE
0x11	4C
0x12	34
0x13	1C
0x14	64

START/STOP PERIOD REGISTER (0x1A)

This register is used to control the soft-start and soft-stop period following an enter/exit all channel shut down command or change in the $\overline{\text{PDN}}$ state. This helps reduce pops and clicks at start-up and shutdown.The times are only approximate and vary depending on device activity level and I2S clock stability.

Table 15. Start/Stop Period Register (0x1A)

D7	D6	D5	D4	D3	D2	D1	D0	FUNCTION

OSCILLATOR TRIM REGISTER (0x1B)

The TAS5708 PWM processor contains an internal oscillator to support autodetect of I2S clock rates. This reduces system cost because an external reference is not required. Currently, TI recommends a reference resistor value of 18.2 kΩ (1%). This should be connected between OSC_RES and DVSSO.

Writing 0X00 to reg 0X1B enables the trim that was programmed at the factory.

Note that trim must always be run following reset of the device.

Table 16. Oscillator Trim Register (0x1B)

D7	D6	D5	D4	D3	D2	D1	D0	FUNCTION

–	–	–	–	–	–	**1**	–	**Factory trim disabled** (1)
–	–	–	–	–	–	–	**0**	**Reserved** (1)

(1) Default values are in **bold**.

BKND_ERR REGISTER (0x1C)

When a back-end error signal is received from the internal power stage, the power stage is reset stopping all PWM activity. Subsequently, the modulator waits approximately for the time listed in Table 17 before attempting to re-start the power stage.

Table 17. BKND_ERR Register (0x1C)(1)

D7	D6	D5	D4	D3	D2	D1	D0	FUNCTION
0	0	0	0	0	0	0	X	Reserved
–	–	–	–	**0**	**0**	**1**	**0**	**Set back-end reset period to 299 ms** (2)
–	–	–	–	0	0	1	1	Set back-end reset period to 449 ms
–	–	–	–	0	1	0	0	Set back-end reset period to 598 ms
–	–	–	–	0	1	0	1	Set back-end reset period to 748 ms
–	–	–	–	0	1	1	0	Set back-end reset period to 898 ms
–	–	–	–	0	1	1	1	Set back-end reset period to 1047 ms
–	–	–	–	1	0	0	0	Set back-end reset period to 1197 ms
–	–	–	–	1	0	0	1	Set back-end reset period to 1346 ms
–	–	–	–	1	0	1	X	Set back-end reset period to 1496 ms
–	–	–	–	1	1	X	X	Set back-end reset period to 1496 ms

(1) This register can be written only with a "non-Reserved" value. Also this register can be written once after the reset.
(2) Default values are in **bold**.

INPUT MULTIPLEXER REGISTER (0x20)

This register controls the modulation scheme (AD or BD mode) as well as the routing of I2S audio to the internal channels.

Table 18. Input Multiplexer Register (0x20)

PWM OUTPUT MUX REGISTER (0x25)

This DAP output mux selects which internal PWM channel is output to the external pins. Any channel can be output to any external output pin.

Bits D21–D20: Selects which PWM channel is output to OUT_A

Bits D17–D16: Selects which PWM channel is output to OUT_B

Bits D13–D12: Selects which PWM channel is output to OUT_C

Bits D09–D08: Selects which PWM channel is output to OUT_D

Note that channels are enclosed so that channel 1 = 0x00, channel 2 = 0x01, $\overline{\text{channet 1}}$ = 0x02, and $\overline{\text{channel 2}}$ = 0x03.

PACKAGING INFORMATION

Orderable Device	Status (1)	Package Type	Package Drawing	Pins	Package Qty	Eco Plan (2)	Lead finish/ Ball material (6)	MSL Peak Temp (3)	Op Temp (°C)	Device Marking (4/5)	Samples
TAS5708PHP	ACTIVE	HTQFP	PHP	48	250	RoHS & Green	NIPDAU	Level-3-260C-168 HR	0 to 85	TAS5708	Samples
TAS5708PHPR	ACTIVE	HTQFP	PHP	48	1000	RoHS & Green	NIPDAU	Level-3-260C-168 HR	0 to 85	TAS5708	Samples

(1) The marketing status values are defined as follows:
ACTIVE: Product device recommended for new designs.
LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.
NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.
PREVIEW: Device has been announced but is not in production. Samples may or may not be available.
OBSOLETE: TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".
RoHS Exempt: TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.
Green: TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

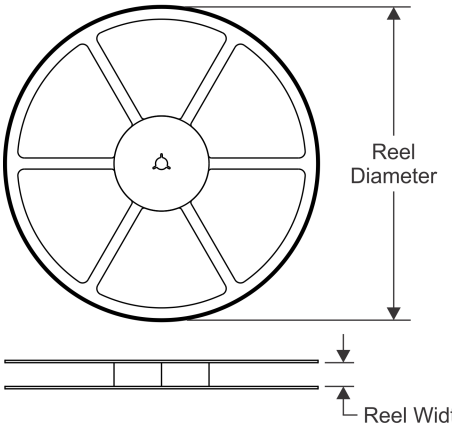
(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

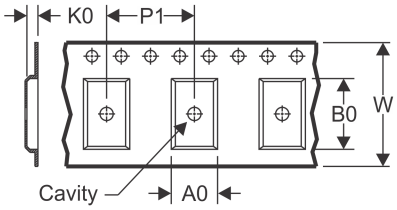
(6) Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

TAPE AND REEL INFORMATION

REEL DIMENSIONS



TAPE DIMENSIONS



A0	Dimension designed to accommodate the component width
B0	Dimension designed to accommodate the component length
K0	Dimension designed to accommodate the component thickness
W	Overall width of the carrier tape
P1	Pitch between successive cavity centers

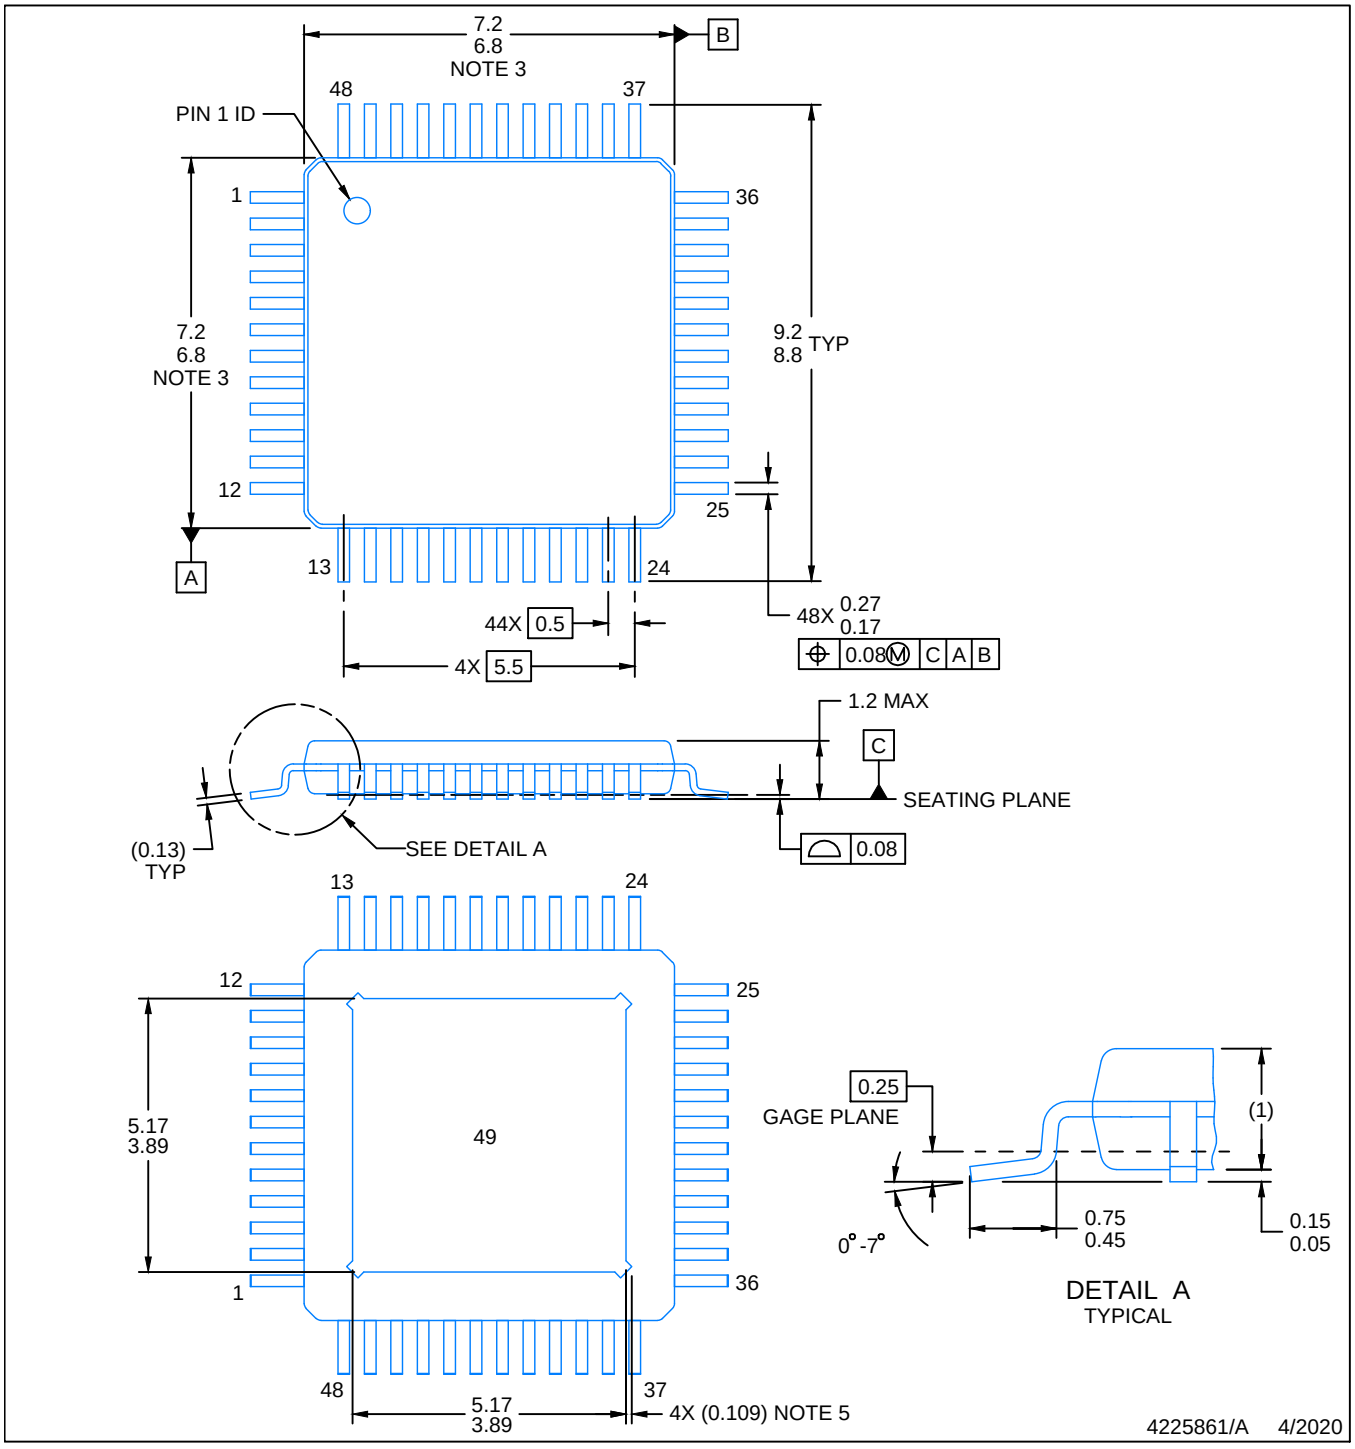
PowerPAD™ HTQFP - 1.2 mm max height

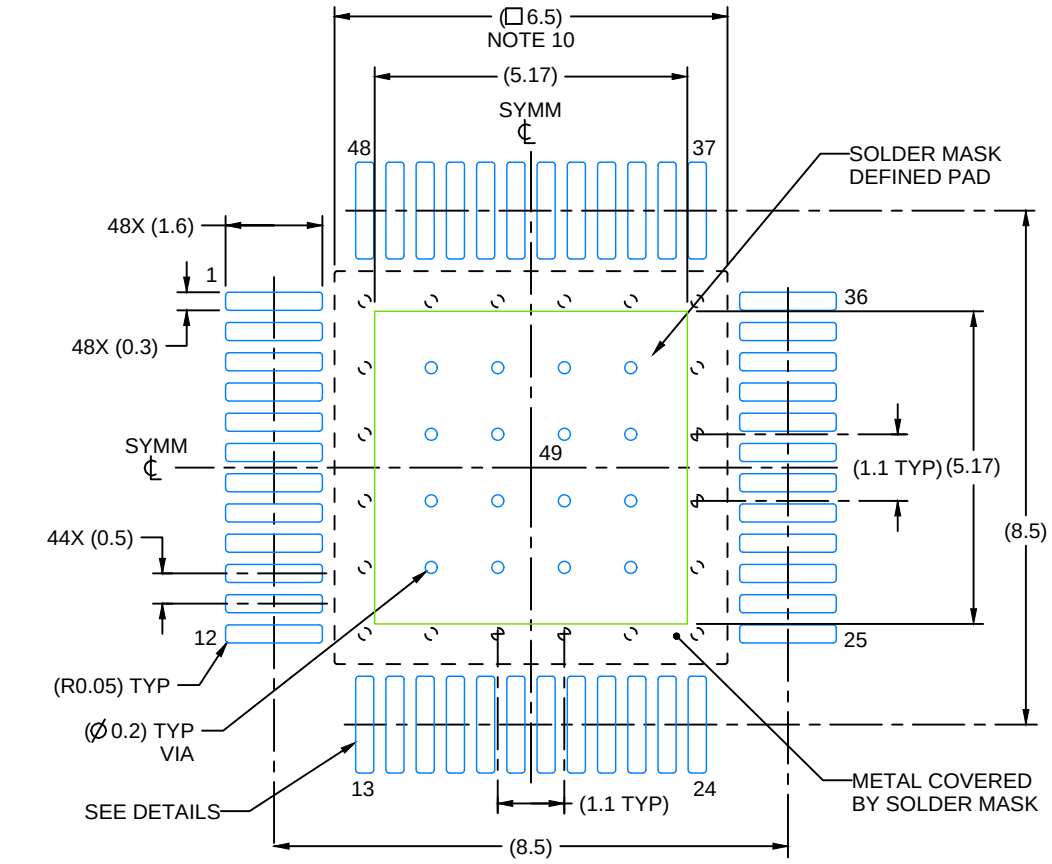
PLASTIC QUAD FLATPACK



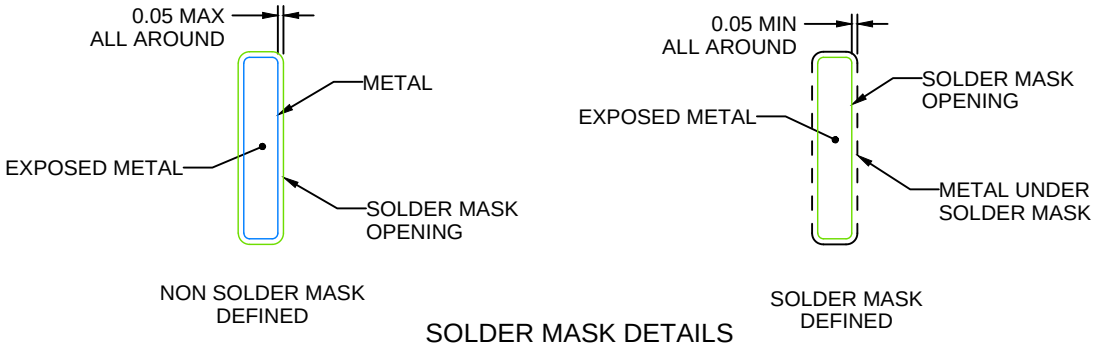
PowerPAD is a trademark of Texas Instruments.

NOTES:

1. All linear dimensions are in millimeters. Any dimensions in parenthesis are for reference only. Dimensioning and tolerancing per ASME Y14.5M.
2. This drawing is subject to change without notice.
3. This dimension does not include mold flash, protrusions, or gate burrs. Mold flash, protrusions, or gate burrs shall not exceed 0.15 mm per side.
4. Reference JEDEC registration MS-026.
5. Feature may not be present.



LAND PATTERN EXAMPLE
EXPOSED METAL SHOWN
SCALE:8X

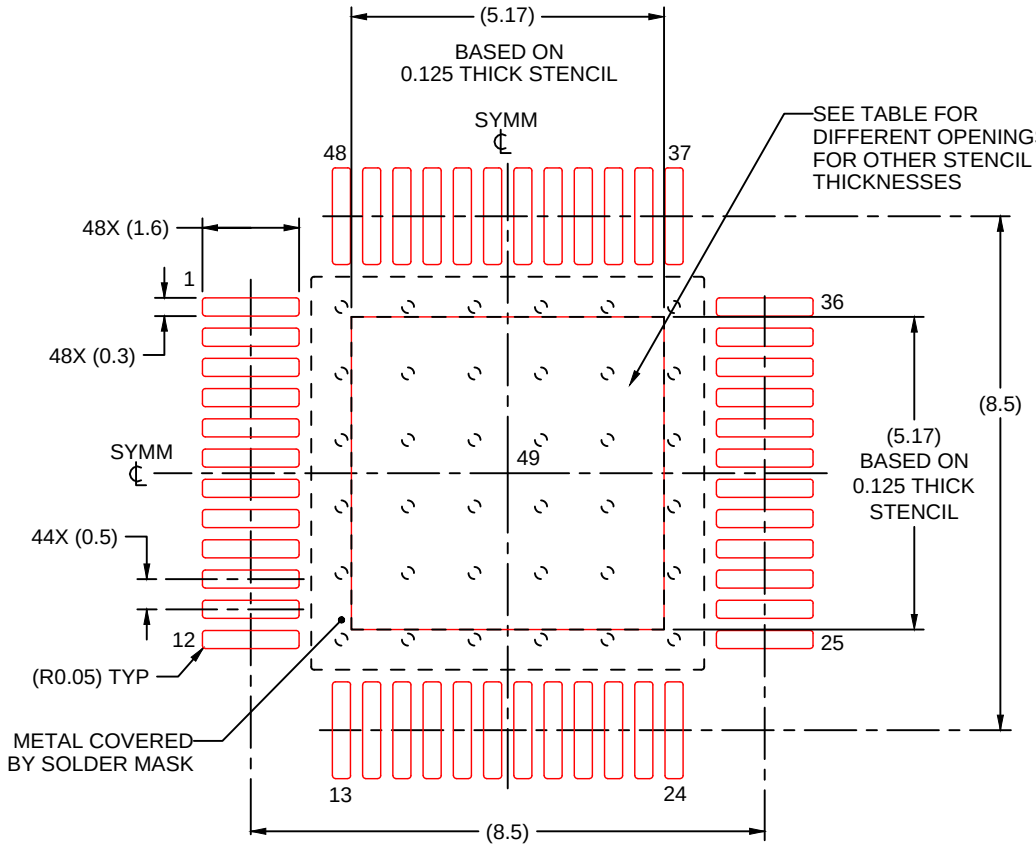


SOLDER MASK DETAILS

4225861/A 4/2020

NOTES: (continued)

6. Publication IPC-7351 may have alternate designs.
7. Solder mask tolerances between and around signal pads can vary based on board fabrication site.
8. This package is designed to be soldered to a thermal pad on the board. See technical brief, Powerpad thermally enhanced package, Texas Instruments Literature No. SLMA002 (www.ti.com/lit/slma002) and SLMA004 (www.ti.com/lit/slma004).
9. Vias are optional depending on application, refer to device data sheet. It is recommended that vias under paste be filled, plugged or tented.
10. Size of metal pad may vary due to creepage requirement.



SOLDER PASTE EXAMPLE
EXPOSED PAD
100% PRINTED SOLDER COVERAGE BY AREA
SCALE:8X

STENCIL THICKNESS	SOLDER STENCIL OPENING
0.1	5.78 X 5.78
0.125	5.17 X 5.17 (SHOWN)
0.150	4.72 X 4.72
0.175	4.37 X 4.37

4225861/A 4/2020

NOTES: (continued)

11. Laser cutting apertures with trapezoidal walls and rounded corners may offer better paste release. IPC-7525 may have alternate design recommendations.
12. Board assembly site may have different recommendations for stencil design.
