

LMT86、LMT86-Q1 2.2V、SC70/TO-92/TO-92S

模拟温度传感器

1 特性

- LMT86-Q1 符合 AEC-Q100 标准，适用于汽车应用：
 - 器件温度等级 0: -40°C 至 $+150^{\circ}\text{C}$
 - 器件人体放电模式 (HBM) 静电放电 (ESD) 分类等级 2
 - 器件 CDM ESD 分类等级 C6
- LMT86LPG (TO-92S 封装) 具有快速热时间常量，典型值为 10s (空气流量为 1.2m/s)
- 非常精确：典型值 $\pm 0.4^{\circ}\text{C}$
- 2.2V 低压运行
- $-10.9\text{mV}/^{\circ}\text{C}$ 的平均传感器增益
- $5.4\mu\text{A}$ 低静态电流
- 宽温度范围： -50°C 至 150°C
- 输出受到短路保护
- 具有 $\pm 50\mu\text{A}$ 驱动能力的推挽输出
- 封装尺寸兼容符合行业标准的 LM20/19 和 LM35 温度传感器
- 具有成本优势的热敏电阻替代产品

2 应用

- 汽车
- 信息娱乐系统与仪表组
- 动力传动系统
- 烟雾和热量探测器
- 无人机
- 电器

3 说明

LMT86 和 LMT86-Q1 是精密 CMOS 温度传感器，其典型精度为 $\pm 0.4^{\circ}\text{C}$ (最大值为 $\pm 2.7^{\circ}\text{C}$)，且线性模拟输出电压与温度成反比关系。2.2V 工作电源电压、 $5.4\mu\text{A}$ 静态电流和 0.7ms 加电时间可实现有效的功率循环架构，以最大限度地降低无人机和传感器节点等电池供电应用的功耗。LMT86LPG 穿孔 TO-92S 封装快速热时间常量支持非板载时间温度敏感型应用，例如烟雾和热量探测器。LMT86-Q1 器件符合 AEC-Q100 0 级标准，在整个工作温度范围内可保持 $\pm 2.7^{\circ}\text{C}$ 的最大精度，且无需校准；因此 LMT86-Q1 适用于汽车应用，例如信息娱乐系统、仪表组和动力传动系统。得益于宽工作范围内的精度和其他特性，LMT86 和 LMT86-Q1 成为热敏电阻的优质替代产品。

对于具有不同平均传感器增益和类似精度的器件，请参阅 [类似替代器件](#) 了解 LMT8x 系列中的替代器件。

器件信息⁽¹⁾

器件型号	封装	封装尺寸 (标称值)
LMT86	SOT (5)	2.00mm × 1.25mm
	TO-92 (3)	4.3mm × 3.5mm
LMT86-Q1	SOT (5)	2.00mm × 1.25mm

4 修订历史记录

注：之前版本的页码可能与当前版本有所不同。

Changes from Revision C (October 2015) to Revision D	Page
• 将产品说明书文本更新为最新的文档和翻译标准 1	1
• 将 AEC-Q100 汽车标准项目符号添加到了“特性”中 1	1
• 添加了时间常量图 1	1
• 将磁盘驱动器、游戏、无线收发器和手机从“应用”中进行了删除 1	1
• Added LPG (TO-92S) package 3	3
• Added Figure 10 to <i>Typical Characteristics</i> 7	7

Changes from Revision B (May 2014) to Revision C	Page
• 已删除 所有涉及 TO-126 封装的内容 1	1
• Added TO-92 LPM pin configuration graphic 3	3
• Changed Handling Ratings to ESD Ratings and moved Storage Temperature to Absolute Maximum Ratings table 4	4
• Changed KV to V 4	4
• Added layout recommendation for TO-92 LP and LPM packages 15	15

Changes from Revision A (June 2013) to Revision B	Page
• 已更改 产品说明书流程和布局，以符合新的 TI 标准。添加了以下部分：应用和实施；电源建议；布局；器件和文档支持；机械、封装和可订购信息 1	1
• 已添加 TO-92 和 TO-126 封装信息。 1	1
• Changed from 450°C/W to 275 °C/W. New specification is derived using TI ' s latest methodology. 5	5
• Changed Temperature Accuracy V_{DD} condition from 2.4V to 2.2V for range of 40°C to 150°C. 6	6
• Deleted Note: The input current is leakage only and is highest at high temperature. It is typically only 0.001 μ A. The 1 μ A limit is solely based on a testing limitation and does not reflect the actual performance of the part..... 6	6

5 Device Comparison Tables

Table 1. Available Device Packages

ORDER NUMBER ⁽¹⁾	PACKAGE	PIN	BODY SIZE (NOM)	MOUNTING TYPE
LMT86DCK	SOT (AKA ⁽²⁾ : SC70, DCK)	5	2.00 mm × 1.25 mm	Surface Mount
LMT86LP	TO-92 (AKA ⁽²⁾ : LP)	3	4.30 mm × 3.50 mm	Through-hole; straight leads
LMT86LPG	TO-92S (AKA ⁽²⁾ : LPG)	3	4.00 mm × 3.15 mm	Through-hole; straight leads
LMT86LPM	TO-92 (AKA ⁽²⁾ : LPM)	3	4.30 mm × 3.50 mm	Through-hole; formed leads
LMT86DCK-Q1	SOT (AKA ⁽²⁾ : SC70, DCK)	5	2.00 mm × 1.25 mm	Surface Mount

(1) For all available packages and complete order numbers, see the Package Option addendum at the end of the data sheet.

(2) AKA = Also Known As

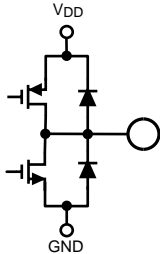

Table 2. Comparable Alternative Devices

DEVICE NAME	AVERAGE OUTPUT SENSOR GAIN	POWER SUPPLY RANGE
LMT84/LMT84-Q1	-5.5 mV/°C	1.5 V to 5.5 V
LMT85/LMT85-Q1	-8.2 mV/°C	1.8 V to 5.5 V
LMT86/LMT86-Q1	-10.9 mV/°C	2.2 V to 5.5 V
LMT87/LMT87-Q1	-13.6 mV/°C	2.7 V to 5.5 V

6 Pin Configuration and Functions

Pin Functions

PIN				DESCRIPTION		
NAME	SOT (SC70)	TO-92	TO-92S	TYPE	EQUIVALENT CIRCUIT	FUNCTION
GND	1, 2 ⁽¹⁾	1	2	Ground	N/A	Power Supply Ground
OUT	3	2	1	Analog Output		Outputs a voltage that is inversely proportional to temperature
V _{DD}	4, 5	3	3	Power	N/A	Positive Supply Voltage

(1) Direct connection to the back side of the die

7 Specifications

7.1 Absolute Maximum Ratings⁽¹⁾⁽²⁾

	MIN	MAX	UNIT
Supply voltage	-0.3	6	V
Voltage at output pin	-0.3	(V _{DD} + 0.5)	V
Output current	-7	7	mA
Input current at any pin ⁽³⁾	-5	5	mA
Maximum junction temperature (T _{JMAX})		150	°C
Storage temperature, T _{stg}	-65	150	°C

- Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions*. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
- Soldering process must comply with TI's Reflow Temperature Profile specifications. Refer to www.ti.com/packaging. Reflow temperature profiles are different for lead-free and non-lead-free packages.
- When the input voltage (V_I) at any pin exceeds power supplies (V_I < GND or V_I > V), the current at that pin should be limited to 5 mA.

7.2 ESD Ratings – LMT86

		VALUE	UNIT
LMT86LP in TO-92 package			
V _(ESD)	Electrostatic discharge	Human-body model (HBM), per ANSI/ESDA/JEDEC JS-001 ⁽¹⁾⁽²⁾	±2500
		Charged-device model (CDM), per JEDEC specification JESD22-C101 ⁽³⁾	±1000
LMT86DCK in SC70 package			
V _(ESD)	Electrostatic discharge	Human-body model (HBM), per JESD22-A114 ⁽²⁾	±2500
		Charged-device model (CDM), per JEDEC specification JESD22-C101 ⁽³⁾	±1000

- JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.
- The human body model is a 100-pF capacitor discharged through a 1.5-kΩ resistor into each pin.
- JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

7.3 ESD Ratings – LMT86-Q1

		VALUE	UNIT
LMT86DCK-Q1 in SC70 package			
V _(ESD)	Electrostatic discharge	Human-body model (HBM), per AEC Q100-002 ⁽¹⁾	±2500
		Charged-device model (CDM), per AEC Q100-011	±1000

- AEC Q100-002 indicates that HBM stressing shall be in accordance with the ANSI/ESDA/JEDEC JS-001 specification.

7.4 Recommended Operating Conditions

	MIN	MAX	UNIT
Specified temperature	$T_{\text{MIN}} \leq T_A \leq T_{\text{MAX}}$		°C
	$-50 \leq T_A \leq 150$		°C
Supply voltage (V_{DD})	2.2	5.5	V

7.5 Thermal Information⁽¹⁾

THERMAL METRIC ⁽²⁾	LMT86/ LMT86-Q1	LMT86LP	LMT86LPG	UNIT
	DCK (SOT/SC70)	LP/LPM (TO-92)	LPG (TO-92S)	
	5 PINS	3 PINS	3 PINS	
$R_{\theta\text{JA}}$ Junction-to-ambient thermal resistance ⁽³⁾⁽⁴⁾	275	167	130.4	°C/W
$R_{\theta\text{JC(top)}}$ Junction-to-case (top) thermal resistance	84	90	64.2	°C/W
$R_{\theta\text{JB}}$ Junction-to-board thermal resistance	56	146	106.2	°C/W
Ψ_{JT} Junction-to-top characterization parameter	1.2	35	14.6	°C/W
Ψ_{JB} Junction-to-board characterization parameter	55	146	106.2	°C/W

- (1) For information on self-heating and thermal response time, see section [Mounting and Thermal Conductivity](#).
- (2) For more information about traditional and new thermal metrics, see the [IC Package Thermal Metrics](#) application report.
- (3) The junction to ambient thermal resistance ($R_{\theta\text{JA}}$) under natural convection is obtained in a simulation on a JEDEC-standard, High-K board as specified in JESD51-7, in an environment described in JESD51-2. Exposed pad packages assume that thermal vias are included in the PCB, per JESD 51-5.
- (4) Changes in output due to self heating can be computed by multiplying the internal dissipation by the thermal resistance.

7.6 Accuracy Characteristics

These limits do not include DC load regulation. These stated accuracy limits are with reference to the values in [Table 3](#).

PARAMETER	CONDITIONS	MIN ⁽¹⁾	TYP ⁽²⁾	MAX ⁽¹⁾	UNIT
Temperature accuracy ⁽³⁾	40°C to 150°C; $V_{DD} = 2.2\text{ V to }5.5\text{ V}$	-2.7	±0.4	2.7	°C
	0°C to 40°C; $V_{DD} = 2.4\text{ V to }5.5\text{ V}$	-2.7	±0.7	2.7	°C
	0°C to 70°C; $V_{DD} = 3.0\text{ V to }5.5\text{ V}$		±0.3		°C
	-50°C to 0°C; $V_{DD} = 3.0\text{ V to }5.5\text{ V}$	-2.7	±0.7	2.7	°C
	-50°C to 0°C; $V_{DD} = 3.6\text{ V to }5.5\text{ V}$		±0.25		°C

- (1) Limits are specified to TI's AOQL (Average Outgoing Quality Level).
- (2) Typical values are at $T_J = T_A = 25^\circ\text{C}$ and represent most likely parametric norm.
- (3) Accuracy is defined as the error between the measured and reference output voltages, tabulated in the Transfer Table at the specified conditions of supply gain setting, voltage, and temperature (expressed in °C). Accuracy limits include line regulation within the specified conditions. Accuracy limits do not include load regulation; they assume no dc load.

7.7 Electrical Characteristics

Unless otherwise noted, these specifications apply for $+V_{DD} = 2.2\text{ V to }5.5\text{ V}$. MIN and MAX limits apply for $T_A = T_J = T_{MIN}$ to T_{MAX} , unless otherwise noted; typical values apply for $T_A = T_J = 25^\circ\text{C}$.

PARAMETER	TEST CONDITIONS	MIN ⁽¹⁾	TYP ⁽²⁾	MAX ⁽¹⁾	UNIT
Average sensor gain (output transfer function slope)	-30°C and 90°C used to calculate average sensor gain		-10.9		mV/°C
Load regulation ⁽³⁾	Source $\leq 50\ \mu\text{A}$, $(V_{DD} - V_{OUT}) \geq 200\text{ mV}$	-1	-0.22		mV
	Sink $\leq 50\ \mu\text{A}$, $V_{OUT} \geq 200\text{ mV}$		0.26	1	mV
Line regulation ⁽⁴⁾			200		$\mu\text{V/V}$
I_S Supply current	$T_A = 30^\circ\text{C to }150^\circ\text{C}$, $(V_{DD} - V_{OUT}) \geq 100\text{ mV}$		5.4	8.1	μA
	$T_A = -50^\circ\text{C to }150^\circ\text{C}$, $(V_{DD} - V_{OUT}) \geq 100\text{ mV}$		5.4	9	μA
C_L Output load capacitance			1100		pF
Power-on time ⁽⁵⁾	$C_L = 0\text{ pF to }1100\text{ pF}$		0.7	1.9	ms
Output drive	$T_A = T_J = 25^\circ\text{C}$	-50		50	μA

- (1) Limits are specific to TI's AOQL (Average Outgoing Quality Level).
- (2) Typical values are at $T_J = T_A = 25^\circ\text{C}$ and represent most likely parametric norm.
- (3) Source currents are flowing out of the LMT86 and LMT86-Q1. Sink currents are flowing into the LMT86 and LMT86-Q1.
- (4) Line regulation (DC) is calculated by subtracting the output voltage at the highest supply voltage from the output voltage at the lowest supply voltage. The typical DC line regulation specification does not include the output voltage shift discussed in [Output Voltage Shift](#).
- (5) Specified by design and characterization.

8 Detailed Description

8.1 Overview

The LMT86 and LMT86-Q1 are analog output temperature sensors. The electrical characteristics of the LMT86 and LMT86-Q1 are identical, so for clarity, the devices will be subsequently referred to as simply LMT86. The temperature-sensing element is comprised of a simple base emitter junction that is forward biased by a current source. The temperature-sensing element is then buffered by an amplifier and provided to the OUT pin. The amplifier has a simple push-pull output stage thus providing a low impedance output source.

8.2 Functional Block Diagram

Full-Range Celsius Temperature Sensor (–50°C to +150°C)

8.3 Feature Description

8.3.1 LMT86 Transfer Function

The output voltage of the LMT86, across the complete operating temperature range, is shown in Table 3. This table is the reference from which the LMT86 accuracy specifications (listed in the [Accuracy Characteristics](#) section) are determined. This table can be used, for example, in a host processor look-up table. A file containing this data is available for download at [LMT86](#) product folder under *Tools and Software Models*.

Table 3. LMT86 Transfer Table

TEMP (°C)	V _{OUT} (mV)	TEMP (°C)	V _{OUT} (mV)	TEMP (°C)	V _{OUT} (mV)	TEMP (°C)	V _{OUT} (mV)	TEMP (°C)	V _{OUT} (mV)
-50	2616	-10	2207	30	1777	70	1335	110	883

-11	2218	29	1788	69	1346	109	895	149	432
								150	420

Although the LMT86 is very linear, its response does have a slight umbrella parabolic shape. This shape is very accurately reflected in [Table 3](#). The Transfer Table can be calculated by using the parabolic equation ([Equation 1](#)).

$$V_{TEMP} (mV) = 1777.3mV - \left[10.888 \frac{mV}{^{\circ}C} (T - 30^{\circ}C) \right] - \left[0.00347 \frac{mV}{^{\circ}C^2} (T - 30^{\circ}C)^2 \right] \quad (1)$$

The parabolic equation is an approximation of the transfer table and the accuracy of the equation degrades slightly at the temperature range extremes. [Equation 1](#) can be solved for T resulting in:

$$T = \frac{10.888 - \sqrt{(-10.888)^2 + 4 \times 0.00347 \times (1777.3 - V_{TEMP} (mV))}}{2 \times (-0.00347)} + 30 \quad (2)$$

For an even less accurate linear approximation, a line can easily be calculated over the desired temperature range from the table using the two-point equation ([Equation 3](#)):

$$V - V_1 = \left(\frac{V_2 - V_1}{T_2 - T_1} \right) \times (T - T_1)$$

where

- V is in mV,
- T is in °C,
- T₁ and V₁ are the coordinates of the lowest temperature,
- and T₂ and V₂ are the coordinates of the highest temperature.

(3)

For example, if the user wanted to resolve this equation, over a temperature range of 20°C to 50°C, they would proceed as follows:

$$V - 1885 \text{ mV} = \left(\frac{1558 \text{ mV} - 1885 \text{ mV}}{50^\circ\text{C} - 20^\circ\text{C}} \right) \times (T - 20^\circ\text{C}) \quad (4)$$

$$V - 1885 \text{ mV} = (-10.9 \text{ mV} / ^\circ\text{C}) \times (T - 20^\circ\text{C}) \quad (5)$$

$$V = (-10.9 \text{ mV} / ^\circ\text{C}) \times T + 2103 \text{ mV} \quad (6)$$

Using this method of linear approximation, the transfer function can be approximated for one or more temperature ranges of interest.

8.4 Device Functional Modes

8.4.1 Mounting and Thermal Conductivity

The LMT86 can be applied easily in the same way as other integrated-circuit temperature sensors. It can be glued or cemented to a surface.

To ensure good thermal conductivity, the backside of the LMT86 die is directly attached to the GND pin. The temperatures of the lands and traces to the other leads of the LMT86 will also affect the temperature reading.

Alternatively, the LMT86 can be mounted inside a sealed-end metal tube, and can then be dipped into a bath or screwed into a threaded hole in a tank. As with any IC, the LMT86 and accompanying wiring and circuits must be kept insulated and dry, to avoid leakage and corrosion. This is especially true if the circuit may operate at cold temperatures where condensation can occur. If moisture creates a short circuit from the output to ground or V_{DD} , the output from the LMT86 will not be correct. Printed-circuit coatings are often used to ensure that moisture cannot corrode the leads or circuit traces.

The thermal resistance junction to ambient ($R_{\theta JA}$ or θ_{JA}) is the parameter used to calculate the rise of a device junction temperature due to its power dissipation. Use [Equation 7](#) to calculate the rise in the LMT86 die temperature:

$$T_J = T_A + \theta_{JA} [(V_{DD} I_S) + (V_{DD} - V_O) I_L]$$

where

- T_A is the ambient temperature,
- I_S is the supply current,
- I_L is the load current on the output,
- and V_O is the output voltage. (7)

For example, in an application where $T_A = 30^\circ\text{C}$, $V_{DD} = 5\text{V}$, $I_S = 5.4 \mu\text{A}$, $V_O = 1777 \text{ mV}$ junction temp 30.014°C self-heating error of 0.014°C . Because the junction temperature of the LMT86 is the actual temperature being measured, take care to minimize the load current that the LMT86 is required to drive. [Thermal Information^{\(1\)}](#) shows the thermal resistance of the LMT86.

8.4.2 Output Noise Considerations

A push-pull output gives the LMT86 the ability to sink and source significant current. This is beneficial when, for example, driving dynamic loads like an input stage on an analog-to-digital converter (ADC). In these applications the source current is required to quickly charge the input capacitor of the ADC. The LMT86 is ideal for this and other applications which require strong source or sink current.

The LMT86 supply-noise gain (the ratio of the AC signal on V_{OUT} to the AC signal on V_{DD}) was measured during bench tests. The typical attenuation is shown in [Figure 8](#) found in the [Typical Characteristics](#) section. A load capacitor on the output can help to filter noise.

For operation in very noisy environments, some bypass capacitance should be present on the supply within approximately 5 centimeters of the LMT86.

(1) For information on self-heating and thermal response time, see section [Mounting and Thermal Conductivity](#).

Device Functional Modes (continued)

8.4.3 Capacitive Loads

The LMT86 handles capacitive loading well. In an extremely noisy environment, or when driving a switched sampling input on an ADC, it may be necessary to add some filtering to minimize noise coupling. Without any precautions, the LMT86 can drive a capacitive load less than or equal to 1100 pF as shown in [Figure 11](#). For capacitive loads greater than 1100 pF, a series resistor may be required on the output, as shown in [Figure 12](#).

Figure 11. LMT86 No Decoupling Required for Capacitive Loads Less than 1100 pF

Figure 12. LMT86 with Series Resistor for Capacitive Loading Greater than 1100 pF

Table 4. Recommended Series Resistor Values

C_{LOAD}	MINIMUM R_S
1.1 nF to 99 nF	3 k Ω
100 nF to 999 nF	1.5 k Ω
1 μ F	800 Ω

8.4.4 Output Voltage Shift

The LMT86 are very linear over temperature and supply voltage range. Due to the intrinsic behavior of an NMOS/PMOS rail-to-rail buffer, a slight shift in the output can occur when the supply voltage is ramped over the operating range of the device. The location of the shift is determined by the relative levels of V_{DD} and V_{OUT} . The shift typically occurs when $V_{DD} - V_{OUT} = 1$ V.

This slight shift (a few millivolts) takes place over a wide change (approximately 200 mV) in V_{DD} or V_{OUT} . Because the shift takes place over a wide temperature change of 5°C to 20°C, V_{OUT} is always monotonic. The accuracy specifications in the [Accuracy Characteristics](#) table already include this possible shift.

9 Application and Implementation

NOTE

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

9.1 Application Information

The LMT86 features make it suitable for many general temperature-sensing applications. It can operate down to 2.2-V supply with 5.4- μ A power consumption, making it ideal for battery-powered devices. Package options like the through-hole TO-92 package allow the LMT86 to be mounted onboard, off-board, to a heat sink, or on multiple unique locations in the same application.

9.2 Typical Applications

9.2.1 Connection to an ADC

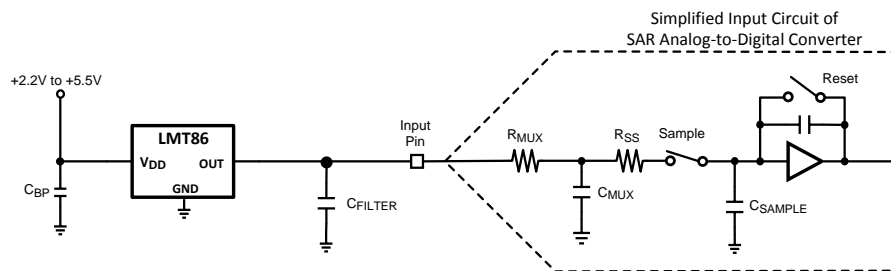

Figure 13. Suggested Connection to a Sampling Analog-to-Digital Converter Input Stage

9.2.1.1 Design Requirements

Most CMOS ADCs found in microcontrollers and ASICs have a sampled data comparator input structure. When the ADC charges the sampling cap, it requires instantaneous charge from the output of the analog source such as the LMT86 temperature sensor and many op amps. This requirement is easily accommodated by the addition of a capacitor, C_{FILTER} .

9.2.1.2 Detailed Design Procedure

The size of C_{FILTER} depends on the size of the sampling capacitor and the sampling frequency. Because not all ADCs have identical input stages, the charge requirements will vary. This general ADC application is shown as an example only.

9.2.1.3 Application Curve

Figure 14. Analog Output Transfer Function

Typical Applications (continued)

9.2.2 Conserving Power Dissipation With Shutdown

Figure 15. Conserving Power Dissipation With Shutdown

9.2.2.1 Design Requirements

Because the power consumption of the LMT86 is less than 9 μA , it can simply be powered directly from any logic gate output and therefore not require a specific shutdown pin. The device can even be powered directly from a microcontroller GPIO. In this way, it can easily be turned off for cases such as battery-powered systems where power savings are critical.

9.2.2.2 Detailed Design Procedure

Simply connect the V_{DD} pin of the LMT86 directly to the logic shutdown signal from a microcontroller.

9.2.2.3 Application Curves

10 Power Supply Recommendations

The low supply current and supply range (2.2 V to 5.5 V) of the LMT86 allow the device to easily be powered from many sources. Power supply bypassing is optional and is mainly dependent on the noise on the power supply used. In noisy systems, it may be necessary to add bypass capacitors to lower the noise that is coupled to the output of the LMT86.

11 Layout

11.1 Layout Guidelines

The LMT86 is extremely simple to layout. If a power-supply bypass capacitor is used, it should be connected as shown in the [Layout Example](#).

(1) The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSELETE: TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

RoHS Exempt: TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

Green: TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

⁽⁶⁾ Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

DCK (R-PDSO-G5)

PLASTIC SMALL-OUTLINE PACKAGE

- NOTES:
- A. All linear dimensions are in millimeters.
 - B. This drawing is subject to change without notice.
 - C. Body dimensions do not include mold flash or protrusion. Mold flash and protrusion shall not exceed 0.15 per side.
 - D. Falls within JEDEC MO-203 variation AA.

DCK (R-PDSO-G5)

PLASTIC SMALL OUTLINE

- NOTES:
- All linear dimensions are in millimeters.
 - This drawing is subject to change without notice.
 - Customers should place a note on the circuit board fabrication drawing not to alter the center solder mask defined pad.
 - Publication IPC-7351 is recommended for alternate designs.
 - Laser cutting apertures with trapezoidal walls and also rounding corners will offer better paste release. Customers should contact their board assembly site for stencil design recommendations. Example stencil design based on a 50% volumetric metal load solder paste. Refer to IPC-7525 for other stencil recommendations.
