

## 具有三态输出的 SNx4LVCH245A 八路总线收发器

### 1 特性

- 工作电压范围 1.65V 至 3.6V
- 输入电压高达 5.5V
- 电压为 3.3V 时,  $t_{pd}$  最大值为 6.3ns
- $V_{CC} = 3.3V$ ,  $T_A = 25^\circ C$  时,  $V_{OLP}$  (输出地弹反射) 典型值小于 0.8V
- $V_{CC} = 3.3V$ ,  $T_A = 25^\circ C$  时,  $V_{OHV}$  (输出  $V_{OH}$  下冲) 典型值大于 2V
- 所有端口 (具有 3.3V  $V_{CC}$  的 5V 输入/输出电压) 均支持混合模式信号运行
- $I_{off}$  支持带电插入、局部关断模式和后驱动保护
- 总线保持数据输入消除了对外部上拉或下拉电阻的需求
- 锁存性能超过 250mA, 符合 JESD 17 规范
- 静电放电 (ESD) 保护性能超过 JESD 22 规范的要求
  - 2000V 人体放电模型 (A114-A)
  - 200V 机器模型 (A115-A)
- 对于符合 MIL-PRF-38535 标准的产品, 所有参数均经过测试, 除非另外注明。对于所有其他产品, 生产流程不一定包含对所有参数的测试。

### 2 应用

- 服务器
- PC 和笔记本电脑
- 网络交换机
- 可穿戴健康设备
- 电信基础设施
- 电子销售终端

### 3 说明

SN54LVCH245A 八路总线收发器专为 2.7V 至 3.6V  $V_{CC}$  操作而设计, SN74LVCH245A 八路总线收发器专为 1.65V 至 3.6V  $V_{CC}$  操作而设计。输入可以由 3.3V 或 5V 器件驱动。此功能允许在混合 3.3V/5V 系统环境中将这些设备用作转换器。

## 6 Specifications

### 6.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted)<sup>(1)</sup>

		MIN	MAX	UNIT
Supply voltage range, $V_{CC}$		-0.5	6.5	V
Input voltage range, $V_I$ <sup>(2)</sup>		-0.5	6.5	V
Voltage range applied to any output in the high-impedance or power-off state, $V_O$ <sup>(2)</sup>		-0.5	6.5	V
Voltage range applied to any output in the high or low state, $V_O$ <sup>(2)(3)</sup>		-0.5	$V_{CC} + 0.5$	V
Input clamp current, $I_{IK}$	$V_I < 0$		-50	mA
Output clamp current, $I_{OK}$	$V_O < 0$		-50	mA
Continuous output current, $I_O$			±50	mA
Continuous current through $V_{CC}$ or GND			±100	mA
Operating virtual junction temperature, $T_j$			150	°C
Storage temperature range, $T_{stg}$		-65	150	°C

- (1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions* is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
- (2) The input and output negative-voltage ratings may be exceeded if the input and output current ratings are observed.
- (3) The value of  $V_{CC}$  is provided in the *Recommended Operating Conditions* table.

### 6.2 ESD Ratings

		MIN	MAX	UNIT
$V_{(ESD)}$ Electrostatic discharge	Human body model (HBM), per ANSI/ESDA/JEDEC JS-001, all pins <sup>(1)</sup>	0	2000	V
	Charged device model (CDM), per JEDEC specification JESD22-C101, all pins <sup>(2)</sup>	0	1500	

- (1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.
- (2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

### 6.3 Recommended Operating Conditions: SN74LVCH245A

## 8 Detailed Description

### 8.1 Overview

The SN54LVCH245A octal bus transceiver is designed for a 2.7-V to 3.6-V  $V_{CC}$  operation, and the SN74LVCH245A octal bus transceiver is designed for a 1.65-V to 3.6-V  $V_{CC}$  operation. Inputs can be driven from either the 3.3-V or 5-V devices. This feature allows the use of these devices as translators in a mixed 3.3-V or 5-V system environment.

These devices are designed for asynchronous communication between data buses. These devices transmit data from the A bus to the B bus or from the B bus to the A bus, depending on the logic level at the direction-control (DIR) input. The output-enable ( $\overline{OE}$ ) input can be used to disable the device, so the buses are effectively isolated.

These devices are fully specified for partial-power-down applications using  $I_{off}$ . The  $I_{off}$  circuitry disables the outputs which prevents damaging current backflow through the devices when they are powered down. To ensure the high-impedance state during power up or power down,  $\overline{OE}$  should be tied to  $V_{CC}$  through a pullup resistor; the minimum value of the resistor is determined by the current-sinking capability of the driver. Active bus-hold circuitry is provided to hold unused or floating data inputs at a valid logic level. The bus-hold circuitry is part of the input circuit and is not disabled by  $\overline{OE}$  or DIR, so use of pullup or pulldown resistors with the bus-hold circuitry is not recommended.

### 8.2 Functional Block Diagram

### 8.3 Feature Description

#### 8.3.1 Balanced High-Drive CMOS Push-Pull Outputs

A balanced output allows the device to sink and source similar currents. The high drive capability of this device creates fast edges into light loads, so routing and load conditions should be taken into consideration to prevent ringing. Additionally, the outputs of this device are capable of driving larger currents than the device can sustain without being damaged. The power output of the device must be limited to avoid thermal runaway and damage caused by over-current. Follow the electrical and thermal limits defined in the [Absolute Maximum Ratings](#) at all times.

#### 8.3.2 Standard CMOS Inputs

Standard CMOS inputs are high impedance, and these inputs are typically modeled as a resistor in parallel with the input capacitance given in the [Electrical Characteristics: SN74LVCH245A](#). The worst case resistance is calculated with the maximum input voltage, given in the [Absolute Maximum Ratings](#), and the maximum input leakage current, given in the [Electrical Characteristics: SN74LVCH245A](#), using ohm's law ( $R = V \div I$ ).

## Feature Description (接下页)

Signals applied to the inputs need to have fast edge rates, as defined by  $\Delta t/\Delta v$  in [Recommended Operating Conditions: SN54LVCH245A](#) to avoid excessive current consumption and oscillations. If a slow or noisy input signal is required, a device with a Schmitt-trigger input should be used to condition the input signal prior to the standard CMOS input.

### 8.3.3 Negative Clamping Diodes

The inputs and outputs to this device have negative clamping diodes as depicted in [图 8](#).

**CAUTION**

Voltages beyond the values specified in the [Absolute Maximum Ratings](#) table can cause damage to the device. The input negative-voltage and output voltage ratings may be exceeded if the input and output clamp-current ratings are observed.

图 8. Electrical Placement of Clamping Diodes for Each Input and Output

### 8.3.4 Bus-Hold Data Inputs

Each data input on this device includes a weak latch that maintains a valid logic level on the input. The state of these latches is unknown at startup and remains unknown until the input has been forced to a valid high or low state. After data has been sent through a channel, the latch then maintains the previous state on the input if the line is left floating.

**注**

It is highly recommended to not use pull-up or pull-down resistors together with a bus-hold input.

Bus-hold data inputs prevent floating inputs on this device. The [Implications of Slow or Floating CMOS Inputs application report](#) explains the problems associated with leaving CMOS inputs floating.

These latches remain active at all times, independent of output disable signals such as direction selection or output enables.

The [Bus-Hold Circuit application report](#) has additional details regarding bus-hold inputs.

图 9. Simplified Schematic For Device With Bus-Hold Data Inputs

## Feature Description (接下页)

### 8.3.5 Partial Power Down ( $I_{off}$ )

The inputs and outputs for this device enter a high-impedance state when the supply voltage is 0 V. The maximum leakage into or out of any input or output pin on the device is specified by  $I_{off}$  in the [Electrical Characteristics: SN74LVCH245A](#).

### 8.3.6 Over-voltage Tolerant Inputs

Input signals to this device can be driven above the supply voltage, as long as the input signals remain below the maximum input voltage value specified in the [Recommended Operating Conditions: SN54LVCH245A](#).

### 8.3.7 Output Enable

This device has an output enable (OE) pin that functions according to . When the outputs of the device are disabled, they are placed into a high impedance state where it will neither source nor sink current. High-impedance outputs are also commonly referred to as three-state or tri-state outputs. The maximum leakage for the output in this state is defined by  $I_{OZ}$  in the [Electrical Characteristics: SN74LVCH245A](#) table.

## 9 Application and Implementation

### 9.1 Application Information

The SN74LVCH245A device is a high-drive CMOS device with bus-hold inputs that can be used for a multitude of bus interface type applications where the data needs to be transmitted and received. The device's output can produce 24 mA of drive current at 3.3 V. Therefore, this device is ideal for driving multiple outputs and for high-speed applications up to 100 MHz. The inputs are 5.5-V tolerant which allows the devices to translate down to  $V_{CC}$ .

Figure 10 shows a typical down-translation application in which the device is being used with a fixed direction to reduce an 8-bit 5-V bus to an 8-bit 1.8-V bus.

Figure 11 shows a typical application in which a bus must switch directions for data transfer between a master and a slave device. The SN74LVCH245A allows either  $V_{CC1}$  or  $V_{CC3}$  to be shut down completely because it has bus-hold inputs that maintains valid states on the floating lines. In this example,  $V_{CC1}$ ,  $V_{CC2}$ , and  $V_{CC3}$  all have the same value, but each supply can be delivered by a separate source.

Figure 12 shows a functional diagram for a single channel of the device, including the bus-hold, direction, and output enable logic components. When the direction is set as 'A to B,' the buffer labeled 'A' is disabled and the buffer labeled 'B' is enabled. When the direction is set as 'B to A,' the buffer labeled 'B' is disabled and the buffer labeled 'A' is enabled. When the output enable pin is deasserted, the buffers labeled 'A' and 'B' are both disabled. The bus-hold circuitry remains active at all times.

### 9.2 Typical Application

图 10. Typical Down-Translation Application

图 11. Typical Direction Controlled Application

图 12. Equivalent Internal Schematic Including Bus-Hold Inputs

## Typical Application (接下页)

### 9.2.1 Design Requirements

This device uses CMOS technology and has a balanced output drive. Care should be taken to avoid bus contention because the device's output can drive currents that exceed maximum limits. The high drive also creates fast edges into light loads; therefore, routing and load conditions should be considered to prevent ringing.

This device has bus-hold inputs, which are always active regardless of DIR or  $\overline{OE}$  input values. For more information, refer to the [Bus-Hold Data Inputs](#).

### 9.2.2 Detailed Design Procedure

#### 1. Recommended Input Conditions

- See ( $\Delta t/\Delta V$ ) in the [Recommended Operating Conditions: SN54LVCH245A](#) table for the input transition rate specification.
- See ( $V_{IH}$  and  $V_{IL}$ ) in the [Recommended Operating Conditions: SN54LVCH245A](#) table for the input voltage high level and input voltage low level specifications.
- The inputs are overvoltage tolerant. This allows them to rise up to 5.5 V at any valid  $V_{CC}$ .
- The inputs can be left floating. The internal bus-hold circuits maintains the last valid state at the inputs.

#### 2. Recommended Output Conditions

- Do not exceed 25 mA per output and 50 mA in total for the device.
- Do not pull outputs above  $V_{CC}$ .

### 9.2.3 Application Curves

图 13.  $I_{CC}$  vs Frequency

## 10 Power Supply Recommendations

The [Recommended Operating Conditions: SN54LVCH245A](#) table shows the power supply can be any voltage between the minimum and maximum supply voltage rating that are listed.

Each  $V_{CC}$  pin should have a good bypass capacitor to prevent power disturbance. For devices with a single supply, 0.1  $\mu\text{F}$  is recommended; if there are multiple  $V_{CC}$  pins, then 0.01  $\mu\text{F}$  or 0.022  $\mu\text{F}$  is recommended for each power pin. It is acceptable to parallel multiple bypass capacitors to reject different noise frequencies. A 0.1  $\mu\text{F}$  and a 1  $\mu\text{F}$  are commonly used in parallel. The bypass capacitor should be installed as close to the power pin as possible for best results.

## 11 Layout

### 11.1 Layout Guidelines

When using multiple-bit logic devices, inputs should never float.

In many cases, functions or parts of functions of digital logic devices are unused. For example, when two inputs of a triple-input AND gate are used or only 3 of the 4 buffer gates are used. Such input pins should not be left unconnected because the undefined voltages at the outside connections result in undefined operational states.

Figure 14 specifies the rules that must be observed under all circumstances. All unused inputs of digital logic devices must be connected to a high or low bias to prevent them from floating. The logic level that should be applied to any particular unused input depends on the function of the device. Generally, they will be tied to GND or  $V_{CC}$ , the deciding factor is based on whichever makes more sense or is more convenient at the time. It is generally acceptable to float outputs, unless the part is a transceiver. If the transceiver has an output enable pin, then asserting the output enable pin will disable the output section of the part. This will not disable the input section of the I/Os, so they cannot float when disabled.

### 11.2 Layout Example

Figure 14 shows an example layout for the ZXY package. This package has a 0.5-mm pitch and requires either micro-vias or very small traces to access the center pins. In this example, 4-mil vias with 10-mil pads are used to access the center pins. All pins are connected by 5-mil traces except for the supply pins which use 10-mil traces.

(1) The marketing status values are defined as follows:

**ACTIVE:** Product device recommended for new designs.

**LIFEBUY:** TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

**NRND:** Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

**PREVIEW:** Device has been announced but is not in production. Samples may or may not be available.

**OBSOLETE:** TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

**RoHS Exempt:** TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

**Green:** TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

- NOTES:
- All linear dimensions are in inches (millimeters).
  - This drawing is subject to change without notice.
  - This package is hermetically sealed with a ceramic lid using glass frit.
  - Index point is provided on cap for terminal identification only on press ceramic glass frit seal only.
  - Falls within MIL STD 1835 GDIP1-T14, GDIP1-T16, GDIP1-T18 and GDIP1-T20.

NOTES:

1. All linear dimensions are in millimeters. Any dimensions in parenthesis are for reference only. Dimensioning and tolerancing per ASME Y14.5M.
2. This drawing is subject to change without notice.
3. The package thermal pad must be soldered to the printed circuit board for thermal and mechanical performance.

4. This package is designed to be soldered to a thermal pad on the board. For more information, see Texas Instruments literature number SLUA271 ([www.ti.com/lit/slua271](http://www.ti.com/lit/slua271)).
5. Vias are optional depending on application, refer to device data sheet. If any vias are implemented, refer to their locations shown on this view. It is recommended that vias under paste be filled, plugged or tented.
