

# DS90UR910-Q1 10MHz 至 75MHz、24 位彩色 FPD-Link II 至 CSI-2 转换器

## 1 特性

- 支持 10MHz 至 75MHz 像素时钟 (PCLK) (280Mbps 至 2.10Gbps FPD-Link II 线速率)
- 兼容直流均衡以及交流耦合的 FPD-Link II 串行位流
- 可对长达 10 米的屏蔽双绞线 (STP) 电缆进行数据恢复
- 符合 v1.00.00 规范的 MIPI D-PHY 模块
- 与 MIPI CSI-2 版本 1.01 兼容
- 支持双通道运行，每条数据通道支持的传输速率最高可达 900Mbps
- 视频流数据包格式：RGB888
- 连续和非连续时钟模式
- 支持超低功耗、退出、高速和控制模式
- 集成输入端接和可调节接收均衡
- 快速随机锁定；无需基准时钟
- CCI/I2C 兼容控制总线
- 全速内置自检 (@Speed BIST) 和报告引脚
- +1.8V 单电源
- 1.8V 或 3.3V 兼容 LVCMOS I/O 接口
- 汽车应用级产品：符合 AEC-Q100 2 级要求
- 8kV ISO 10605 静电放电 (ESD) 额定值
- 6mm x 6mm 超薄型四方扁平无引线 (WQFN)-40 封装

## 2 说明

DS90UR910-Q1 是一款接口桥接芯片，用于恢复 FPD-Link II 串行位流中的数据，并将其转换为符合移动行业处理器接口 (MIPI) 规范的摄像机串行接口 (CSI-2) 格式。该器件可从兼容 FPD-Link II 串行器的串行位流中恢复 24 位或 18 位 RGB 数据以及 3 个视频同步信号。恢复的数据在由符合 MIPI DPHY/CSI-2 规范的半速率串行时钟所选通的两条数据通道中进行封包化和串行化，每条数据通道的传输速率最高可达 900Mbps。FPD-Link II 接收器支持频率最高可达 75MHz 的像素时钟。CSI-2 输出串行总线可显著降低图形处理器 (GPU) 的互连和信号计数，同时面向多台汽车驾驶员辅助摄像机的视频流简化系统设计。

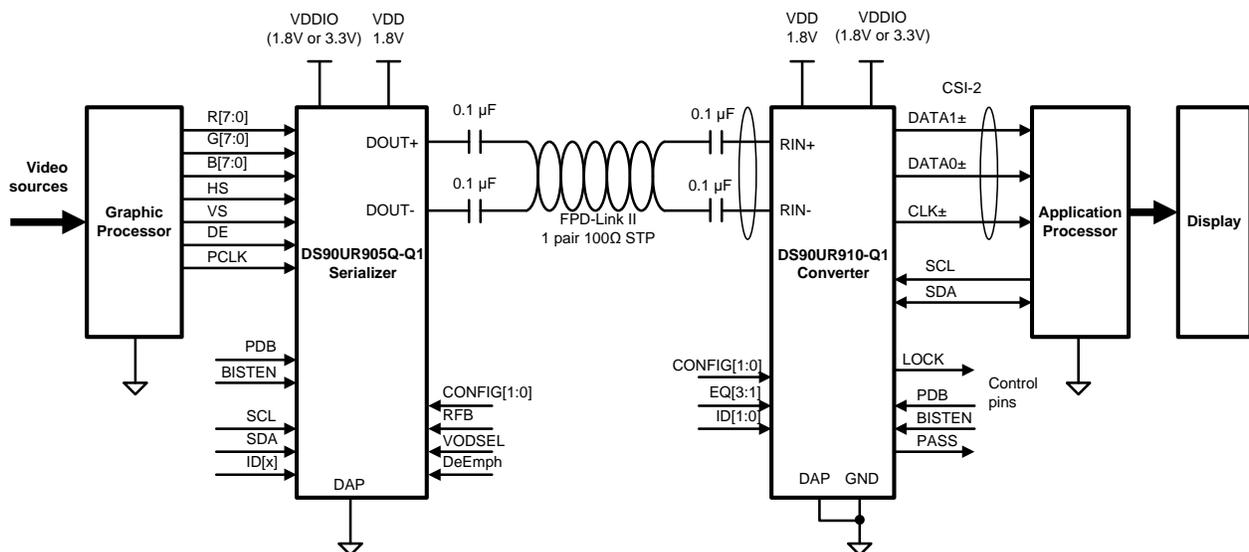

DS90UR910-Q1 采用 40 引脚 WQFN 封装。电气性能符合汽车级 AEC-Q100 2 级标准温度范围 (-40°C 至 +105°C)。

## 3 修订历史记录

修订	说明
2012 年 9 月 17 日	DS90UR910-Q1 数据表 - 最初发布版本
2012 年 10 月 23 日	更新了引脚图
2013 年 5 月 2 日	已将国家数据表的版面布局更改为 TI 格式
2013 年 5 月 17 日	明确了 VDDL 和 VDDA 电源引脚的编号
2015 年 4 月 16 日	将器件状态由“产品预览”更改为“量产数据”。添加了新的章节标题并更新至新的 TI 格式。

## 4 Pin Configuration and Functions

**Pin Descriptions <sup>(1)</sup>**

Pin Name	Pin #	I/O, Type	Description
<b>FPD-Link II Serial Interface</b>			
RIN+ RIN-	33 34	I, CML	Inverting and non-inverting differential inputs. The inputs must be AC Coupled with a 100 nF capacitor.
CMF	35	I, Analog	Common mode filter pin for the differential inputs. CMP is the virtual ground of the differential input stage. A bypass capacitor is connected from CMF to ground to increase the receiver's common mode noise immunity. A 4.7 $\mu$ F ceramic capacitor is recommended.
CMLOUT+ CMLOUT-	37 38	O, CML	Inverting and non-inverting differential outputs. Single 100 $\Omega$ (1%) termination resistor must be placed across the CMLOUT $\pm$ pins. Optional loop-through output to monitor post equalizer and requires use of the Serial Control Bus to enable.
<b>MIPI Interface</b>			
DATA1+ DATA1-	19 18	O, DPHY O, DPHY	Inverting and non-inverting data output of DPHY Lane 1
DATA0+ DATA0-	16 15	O, DPHY O, DPHY	Inverting and non-inverting data output of DPHY Lane 0
CLK+ CLK-	13 12	O, DPHY O, DPHY	Inverting and non-inverting half-rate DPHY clock lane

(1) 1 = HIGH, 0 = LOW

**Pin Descriptions <sup>(1)</sup> (continued)**

Pin Name	Pin #	I/O, Type	Description
<b>Control and Configuration</b>			
PDB	30	I, LVCMOS w/ pull-down	Power Down Mode Input PDB = 1, Device is enabled (normal operation) PDB = 0, Device is in power-down When the device is in the power-down, outputs are TRI-STATE, control registers are RESET.
CONFIG[1:0]	10, 11	I, LVCMOS w/ pull-down	Operating Mode Select CONFIG[1:0] selects compatibility to FPD-Link II serializers. See <a href="#">Table 1</a> .
EQ[3:1]	1, 2, 3	I, LVCMOS w/ pull-down	Receive equalization control EQ[3:1] provides 8 combinations of the receive equalization gain settings. See <a href="#">Table 2</a> . EQ[3:1] optimizes the input equalizer's ability to reduce inter-symbol interference from the loss characteristics of different cable lengths.
BISTEN	29	I, LVCMOS w/ pull-down	BIST Enable Input BISTEN = 1, BIST is enabled BISTEN = 0, BIST is disabled
LOCK	24	O, LVCMOS	LOCK Status Output LOCK = 1, PLL acquired lock to the reference clock input; DPHY outputs are active LOCK = 0, PLL is unlocked
PASS	25	O, LVCMOS	Normal mode status output pin (BISTEN = 0) PASS = 1: No fault detected on input display timing PASS = 0: Indicates an error condition or corruption in display timing. Fault condition occurs if: 1) DE length value mismatch measured once in succession 2) VSync length value mismatch measured twice in succession BIST mode status output pin (BISTEN = 1) PASS = 1: No error detected PASS = 0: Error detected
<b>CCI / I2C Serial Control Bus</b>			
SCL	6	I, LVCMOS, Open Drain	Serial Control Bus Clock Input SCL requires an external pull-up resistor to V <sub>DDIO</sub> .
SDA	5	I/O, LVCMOS Open Drain	Serial Control Bus Data Input / Output SDA requires an external pull-up resistor to V <sub>DDIO</sub> .
ID[1:0]	8, 9	I, LVCMOS w/ pull-down	Serial Control Bus Device ID Address Select See <a href="#">Table 5</a> .
<b>Reserved Pins</b>			
GPIO	21	I/O	General Purpose I/O <b>Note:</b> Pin must be left floating during initial power-up.
RES	28	I, LVCMOS w/ pull-down	Reserved pin. Must tie Low.
<b>Power and Ground</b>			
VDDL	7, 26	Power	Power to logic circuitry, 1.8V ±5%
VDDA	31, 39	Power	Power to analog circuitry, 1.8V ±5%
VDDP	40	Power	Power to PLL, 1.8V ±5%
VDDCSI	20	Power	Power to DPHY CSI-2 drivers, 1.8V ±5%
VDDIO	23	Power	Power to LVCMOS I/O circuitry, 1.8V ±5% OR 3.3V ±10% (V <sub>DDIO</sub> )
GND	4, 14, 17, 22, 27, 32, 36	Ground	Ground return.
GND	DAP	Ground	DAP is the metal contact at the bottom side, located at the center of the WQFN package. It should be connected to the GND plane with multiple via to lower the ground impedance and improve the thermal performance of the package. Connected to the ground plane (GND) with at least 9 vias.

Storage temperature, $T_{stg}$	-65	150	°C

- (1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under . Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
- (2) For soldering specifications, see product folder at [www.ti.com](http://www.ti.com) and [SNOA549](#).

### 5.2 ESD Ratings

		VALUE	UNIT		
$V_{(ESD)}$	Electrostatic discharge	Human body model (HBM), per AEC Q100-002, all pins <sup>(1)</sup>	±8000	V	
		Charged device model (CDM), per AEC Q100-011, all pins	±1000		
		Machine model (MM)	±250		
		(IEC, powered-up only) $R_D = 330 \Omega$ , $C_S = 150 \text{ pF}$	Air Discharge ( $R_{IN+}$ , $R_{IN-}$ )		±30000
			Contact Discharge ( $R_{IN+}$ , $R_{IN-}$ )		±10000
		(ISO10605) $R_D = 330 \Omega$ , $C_S = 150 \text{ pF}$	Air Discharge ( $R_{IN+}$ , $R_{IN-}$ )		±30000
			Contact Discharge ( $R_{IN+}$ , $R_{IN-}$ )		±10000
		(ISO10605) $R_D = 2 \text{ k}\Omega$ , $C_S = 150 \text{ pF}$ or 330 pF	Air Discharge ( $R_{IN+}$ , $R_{IN-}$ )		±30000
Contact Discharge ( $R_{IN+}$ , $R_{IN-}$ )	±10000				

- (1) AEC Q100-002 indicates HBM stressing is done in accordance with the ANSI/ESDA/JEDEC JS-001 specification.

(8) When the output voltage is between 700 mV and 930 mV.

(9)  $U_{I,INST}$  is equal to  $1/(12 \cdot PCLK)$ , where PCLK is the fundamental frequency for data transmission.

(10) This parameter value can be lower than TLPX due to differences in rise vs. fall signal slopes and trip levels and mismatches between Dp and Dn LP transmitters. Any LP exclusive-OR pulse observed during HS EoT (transition from HS level to LP-11) is glitch behavior as described in D-PHY ver 1.00.00.

## 5.8 Typical Characteristics

## 6 Detailed Description

### 6.1 Overview

The DS90UR910-Q1 recovers RGB data and sync signals from a FPD-Link II AC coupled serial bit stream, and converts the recovered data into packetized CSI-2 data format. The CSI-2 output serial interface greatly reduces the interconnect and signal count to a graphic processing unit and eases system designs for video streams from multiple automotive driver assist cameras.

The DS90UR910-Q1 is based on the DS90UR906Q de-serializer core. Please refer to the DS90UR906Q datasheet for the functionality and performance of the FPD-Link II interface can be found in the DS90UR906Q datasheet.

The DS90UR910-Q1 conforms to the MIPI CSI-2 and DPHY standards for protocol and electrical specifications. Compliant with standards:

- Conforms with MIPI Alliance Specification for D-PHY, version 1.00.00, dated May 14, 2009
- Compatible with MIPI Alliance Standard for Camera Serial Interface 2 (CSI-2) Version 1.01, dated Nov 9, 2010

The DS90UR910-Q1 receives 24-bit (or 18-bit) RGB data and 3 low speed control signals (VS, HS, DE) over a serial FPD-Link II transmitted through a single twisted pair. It supports a pixel clock of 10 MHz to 75 MHz, corresponding to the serial line rate of 280 Mb/s to 2100 Mb/s. The serial bit stream contains the scrambled 24-bit data, an embedded clock, encoded control signals and DC balance information which enhances signal quality and supports AC coupling.

The DS90UR910-Q1 is compatible with FPD-Link II serializers such as DS90UR905Q, DS90UR241Q, DS90C241Q, DS90UR907Q, DS99R421Q and DS90UH/UB/92x FPD-Link III serializers in backward compatibility mode. The serial bit stream is illustrated in Figure 10. In each pixel clock cycle, a 28-bit frame is transmitted over the FPD-Link. The frame contains C1 and C0 representing the embedded clock information. C1 is always high and C0 is always low. Payload bits b[23:0] contain the scrambled 24-bit RGB data. DCB is the DC balance bit and is used to minimize the DC offset on the signal line. DCA is used to validate the data integrity in the embedded data stream and contain the encoded control signals VS, HS and DE (DS90UR905Q, DS90UR907Q and DS90UH/UB/92x in backward compatible mode).

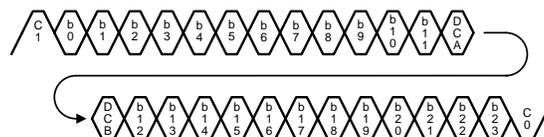

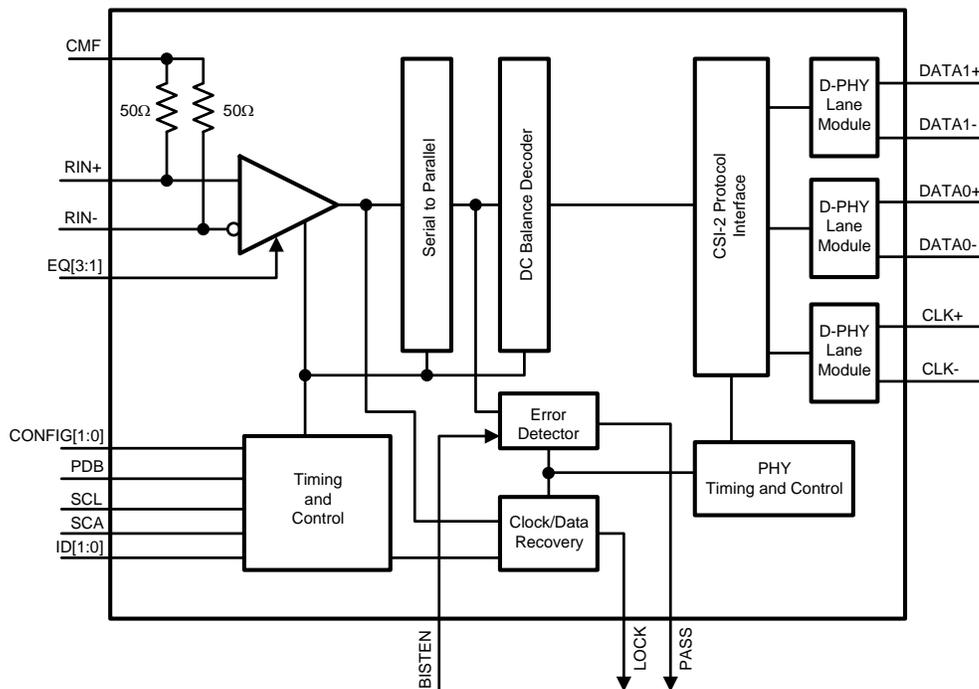

Figure 10. FPD-Link II Serial Stream

The DS90UR910-Q1 supports compatibility to FPD-Link II serializers and FPD-Link III serializers in backward compatible mode as defined in Table 1.

## 6.2 Functional Block Diagram

## 6.3 Feature Description

### 6.3.1 Input Receive Equalization

The input equalizer of the DS90UR910-Q1 is designed to compensate the attenuation distortion results from cable of different length or wire gauge. The equalizer gain setting is controlled by the control pins EQ[3:1] or through register programming. Users can optimize the equalizer's gain setting along with the de-emphasis level of the DS90UR905Q/907Q to achieve the optimum jitter performance.

Note this function cannot be seen at the RIN+/- input but can be observed at the serial test port (CMLOUT+/-) enabled via the Serial Bus control registers. The equalization feature may be controlled by the external pin or by register.

**Table 2. Receiver Equalization Configuration**

1	1	1	~12 dB

(1) Default Setting is EQ = Off

### 6.3.2 CSI-2 Interface

The DS90UR910-Q1 (in default mode) takes the RGB data bits R[7:0], G[7:0] and B[7:0] defined in the 24-bit serializer pinout and directly maps to the RGB888 color space in the data frame. The DS90UR910-Q1 follows the General Frame Format as described in Figure 49 of the CSI-2 standard (repeated here in [Figure 11](#)). Upon the end of the vertical sync pulse (VS), the DS90UR910-Q1 generates the Frame End and Frame Start synchronization packets within the vertical blanking period. The timing of the Frame Start will not reflect the timing of the VS signal.

Upon the rising edge of the DE signal, each active line is output in a long data packet with the RGB888 data format. At the end of each packet, the data lanes DATA0± and DATA1± return to the LP-11 state, while the clock lane CLK± continue outputting the high speed clock.

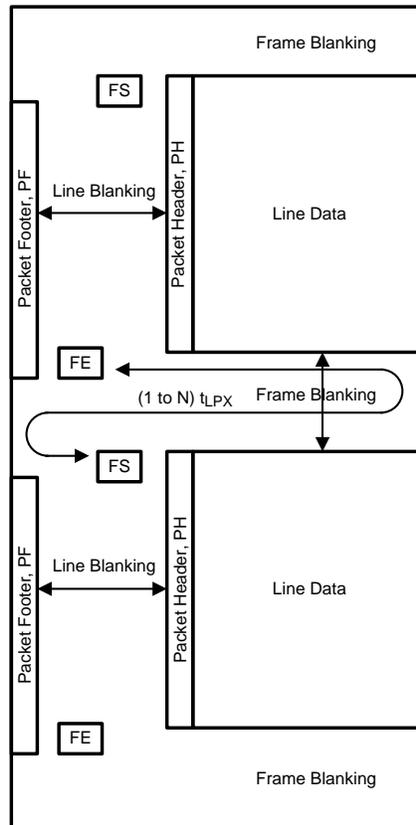

Figure 11. General Frame Format

### 6.3.3 High Speed Clock and Data

The high speed clock and data outputs are source synchronous interface. The half rate clock at CLK± is derived from the pixel clock sourced by the clock/data recovery circuit of the DS90UR910-Q1. The clock frequency is 6 times the Pixel clock frequency. The 24-bit recovered RGB data is serialized and output at the 2 high speed data lanes DATA0± and DATA1± in according to the CSI-2 protocol. The data rate of each lane is 12 times the Pixel clock. As an example, at a pixel clock of 75 MHz, the CLK± runs at 450 MHz, and the data lanes run at 900 Mb/s.

The half-rate clock maintains a quadrature phase relationship to the data signals and allows receiver to sample data at the rising and falling edges of the clock. Figure 3 shows the timing relationship of the clock and data lines. The DS90UR910-Q1 supports continuous high speed clock.

High speed data are sent out at DATA0± and DATA1± in bursts. In between data bursts, the data lanes return to Low Power States in according to protocol defined in D-PHY standard. The rising edge of the differential clock (CLK+ – CLK-) is sent during the first payload bit of a transmission burst in the data lanes.

The DS90UR910-Q1 recovers the data bits R[7:0], G[7:0], B[7:0], VS, HS and DE from the serial FPD-Link II bit stream at RIN±. During the vertical blanking period (VS goes low), it sends the short Frame End packet, followed by a short Frame Start packet. User can program the time between Frame End to Frame Start packets from 0 to (2<sup>16</sup>-1) in units of 8\*pclk\_period/3.

### 6.3.4 Non-continuous/Continuous Clock

DS90UR910-Q1 D-PHY supports Continuous clock mode and Non-Continuous clock mode. Default mode is Non-Continuous Clock mode, where the Clock Lane enters in LP mode between the transmissions of data packets. Non-continuous clock mode will only be non-continuous during the vertical blanking period for lower PCLK rates. For higher PCLK rates, the clock will be non-continuous between line and frame packets. Operating modes are configurable through CCI.

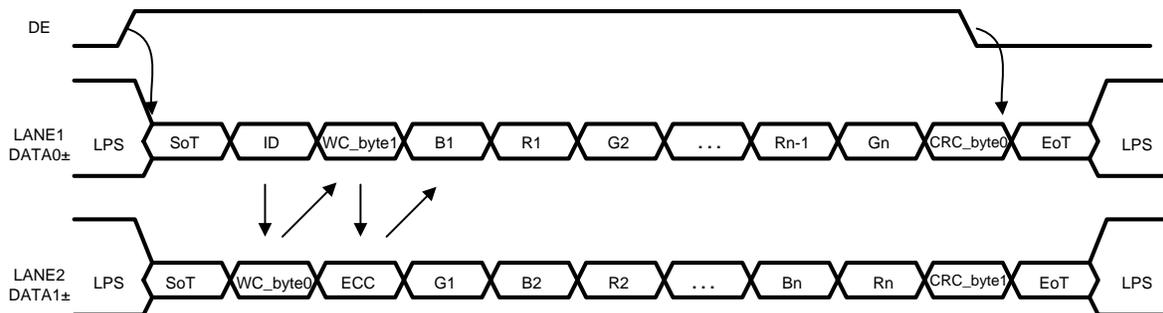

Clock lane enters LP11 during horizontal blanking if the horizontal blanking period is longer than the overhead time to start/stop the clock lane. There is auto-detection of the length of the horizontal blank period. The threshold is 70 PCLK cycles. Register bit available to disable off the non-continuous clock mode

### 6.3.5 Data Frame RGB Mapping

Table 3 shows the pixel data R[7:0], G[7:0 and B[7:0] defined in DS90UR905Q/907Q and DS90UH/UB/92x Serializers pinout, which are recovered by the DS90UR910-Q1 and output in RGB888 format (data type 0x24) at the CSI-2 interface.

### 6.3.6 Serial Control Bus (CCI/I2C)

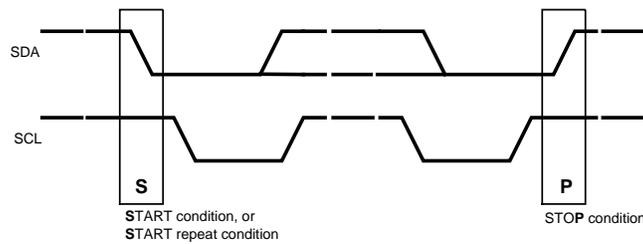

The DS90UR910-Q1 can be configured by the use of the I2C or CCI (Camera Control Interface) as defined by MIPI, which is a bi-directional, half-duplex, serial control bus consists of SDA and SCL. The SDA is the bi-directional data line. The SCL is the serial clock line. Both SCL and SDA are driven by open drain drivers and required external pull-up resistors to VDDIO. The signals are either driven low or pulled high.

The DS90UR910-Q1 is a CCI slave. ID[1:0] pins select one of the four CCI slave addresses (see [Table 5](#)).

**Table 5. CCI/I2C Slave Address**

ID[1]	ID[0]	7-bit slave address	8-bit slave address (0 appended WRITE)
0	0	011 1100 (0x3C'h)	0111 1000 (0x78'h)
0	1	011 1101 (0x3D'h)	0111 1010 (0x7A'h)
1	0	011 0110 (0x36'h)	0110 1100 (0x6C'h)
1	1	011 0111 (0x37'h)	0110 1110 (0x6E'h)

The Serial Bus protocol is initiated by START or START-REPEATED, and terminated by STOP condition. A START occurs when SDA transitions low while SCL is high. A STOP occurs when SDA transitions high when SCL is high. See [Figure 13](#).

**Figure 13. START and STOP Conditions**

To communicate with a remote device, the host controller (master) sends the 7-bit slave address followed by a write-bit (0), and listens for a response from the slave. This response is referred to as an acknowledge bit. If the slave on the bus is addressed correctly, it acknowledges the master by driving the SDA low (ACK). If the address does not match a device's slave address, it negative acknowledges the master by letting SDA be pulled high (NACK). In a write operation from master to slave, the master sends the 8-bit index address of the register that it wants to access. After the slave ACKs, the master sends the 8-bit data byte. The slave ACKs after each data byte is successfully received and is ready to receive another byte into the next sequential index location. At the end of the data transfer, the master ends the transaction with a STOP condition.

In a read operation, the master first sends the 8-bit index address of the register that it wants to access. After receiving an ACK from the slave, it initiates a START-REPEAT condition, sends the 7-bit slave address followed by the read-bit (1). The slave ACKs and sends out the 8-bit data byte. The master acknowledges an ACK when another data byte will be sent to the next sequential index address. The master acknowledges a NACK when no more data byte will be sent, and ends the transaction with a STOP condition.

The CCI interface of the DS90UR910-Q1 supports Standard mode (<100KHz) or Fast mode (<400KHz) with 8-bit index addressing and 8-bit data transfer. It supports the following read/write operations between the DS90UR910-Q1 and the CCI master:

- Single read from random location
- Single read from current location
- Sequential read starting from a random location
- Sequential read starting from the current location
- Single write to a random location
- Sequential write starting from a random location

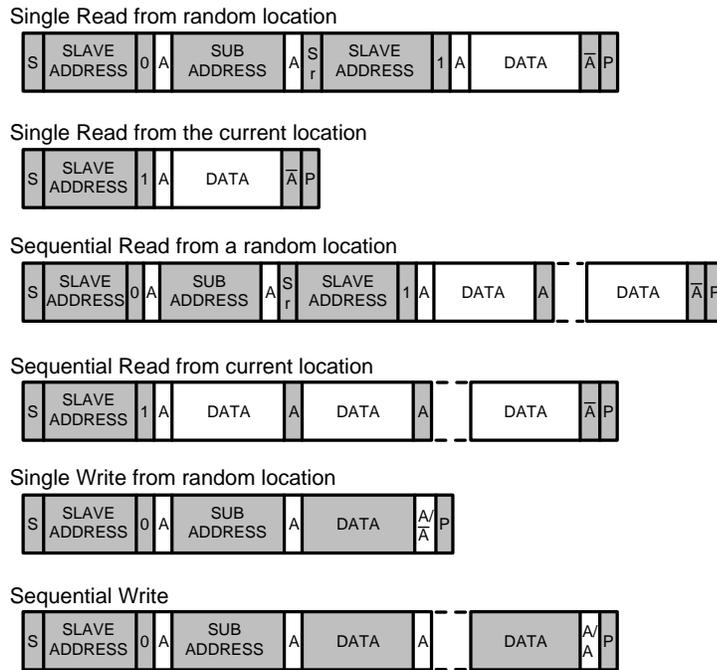

Figure 14. I2C/CCI Read/Write Operations

### 6.3.7 Ultra Low Power State

DS90UR910-Q1 D-PHY Lanes will enter ULPS mode upon software standby mode through CCI generated by Application Processor. When ULPS is entered, all lanes including the clock and data lanes are put in ULPS according to the MIPI D-PHY protocol. D-PHY can reduce power consumption by entering ULPS mode.

Ultra-Low Power State Entry Command is sent after an Escape mode Entry command through CCI, and then Lane shall enter the Ultra-Low Power State (ULPS). When ULPS is entered, all lanes including the clock and data lanes are put in ULPS according to the MIPI DPHY protocol. Typically an ULPS entry command is used but other sequences can be used also. Ultra-Low Power State is exited by means of a Mark-1 state with a length TWAKEUP followed by a Stop state. Reference: [1] D-PHY Specification, Section 5.6.3, Line 895

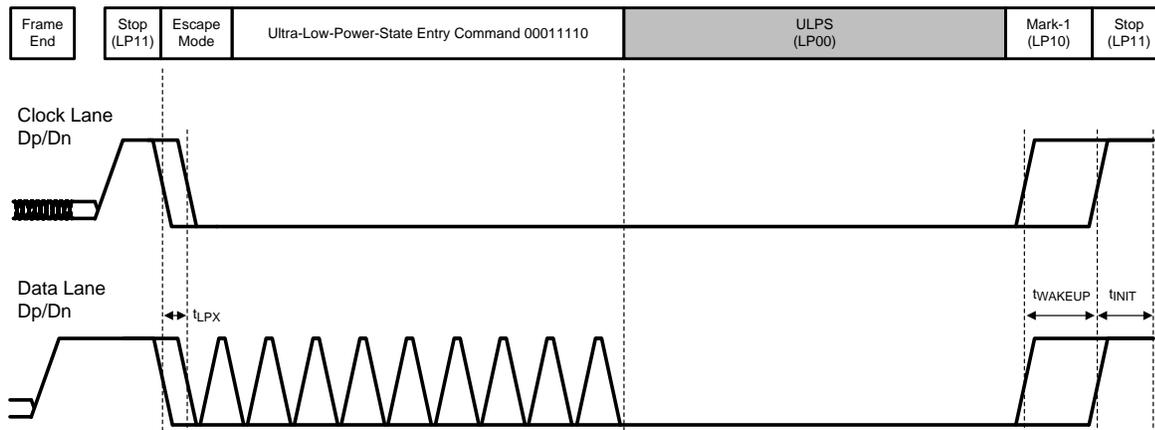

Figure 15. Ultra-Low Power State

### 6.3.8 Display Timing Requirements

Table 6 shows the supported display resolutions for the DS90UR910-Q1. The display timings assume an estimated overall blanking rate of 1.2. The DS90UR910-Q1 will automatically detect the incoming data rate by from the frame rate (by measuring VS). This timing is then mapped into a look up table. The lookup table is used for any pixel rate from PCLK of 10 MHz to 65 MHz. The limitation that it assumes the frame rate is 60fps and 30fps. An override option will be available to set each of the parameter individually for a data rate that is not listed in the table. Option is programmed through CCI. Operation of frequencies above 65 MHz require additional I2C/CCI programming of CSI\_TIMING registers.

## 7 Application and Implementation

### NOTE

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

### 7.1 Typical Application Connection

Figure 16 shows a typical application of the DS90UR910-Q1 in Pin control mode for a 24-bit Color Display Application. The LVDS signals require 100 nF AC coupling capacitors to the line. The line driver includes internal termination. Bypass capacitors are placed near the power supply pins. At a minimum, four 0.1  $\mu\text{F}$  capacitors and a 4.7  $\mu\text{F}$  capacitor should be used for local device bypassing. System GPO (General Purpose Output) signals control the PDB and BISTEN pins. The interface to the host is with 1.8 V LVCMOS levels, thus the VDDIO pin is connected also to the 1.8V rail. The Optional I2C/CCI is connected to the Host bus in this example, thus the SCL and SDA pins are using pull-up resistors R to VDDIO. A delay cap is placed on the PDB signal to delay the enabling of the device until power is stable.

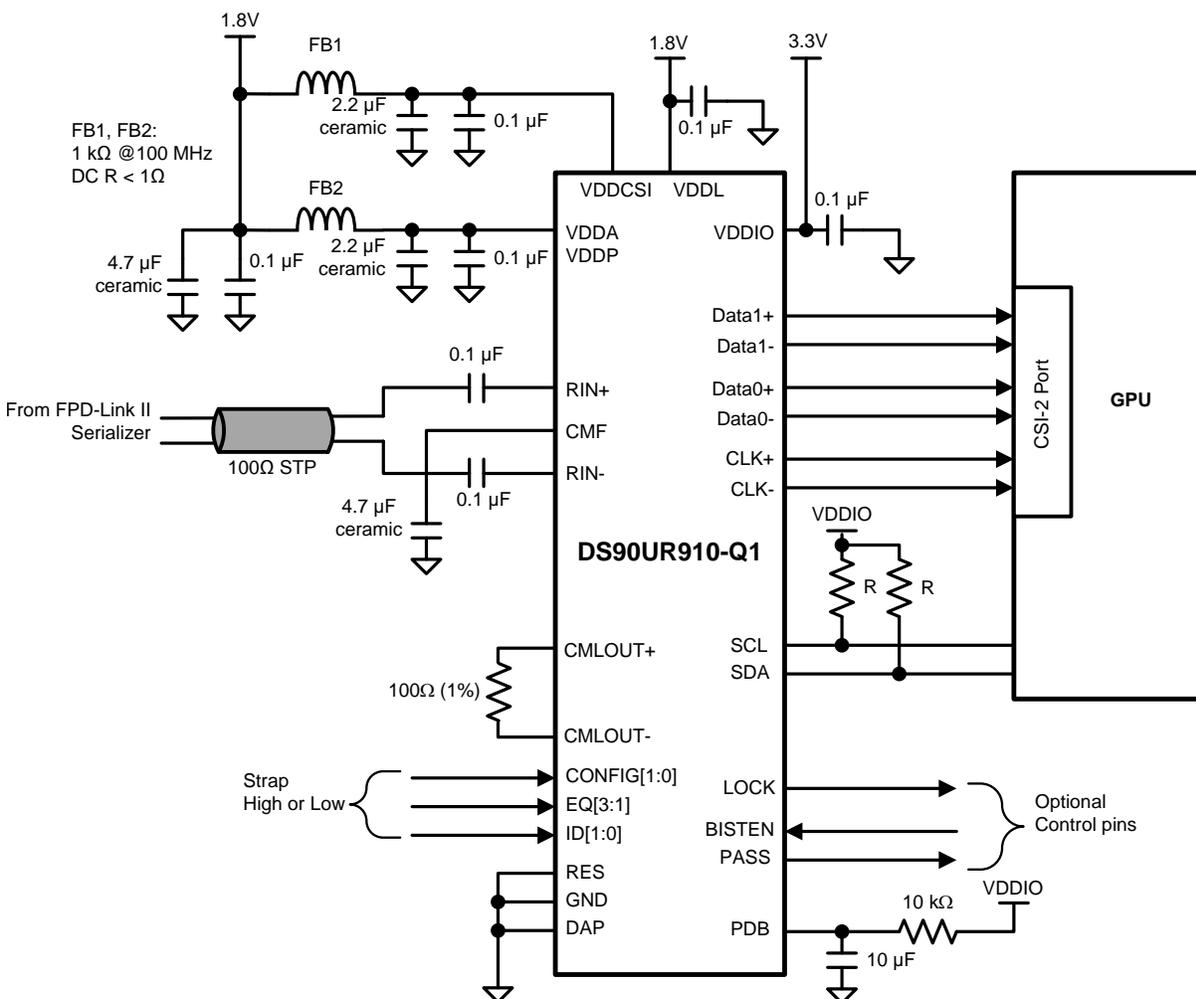

Figure 16. DS90UR910-Q1 Typical Connection Diagram — Pin Control

### 7.2 Design Requirements

For the typical design application, use the following as input parameters.

Design Requirements (continued)

Table 8. Design Parameters

Design Parameter	Example Value
VDDIO	1.8V or 3.3V
VDDL, VDDA, VDDP, VDDCSI	1.8V
AC Coupling Capacitor for RIN0± and RIN1±	100nF

The SER/DES supports only AC-coupled interconnects through an integrated DC-balanced decoding scheme. External AC coupling capacitors must be placed in series in the FPD-Link II signal path as illustrated in Figure 17.

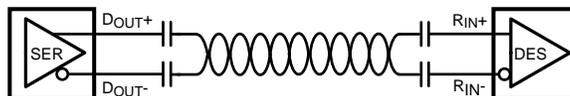

Figure 17. AC-Coupled Connection

For high-speed FPD-Link II transmissions, the smallest available package should be used for the AC coupling capacitor. This will help minimize degradation of signal quality due to package parasitics. The I/O's require 100nF AC coupling capacitors to the line.

7.3 Application Performance Plots

The plot below corresponds to 49MHz PCLK UNH pattern.

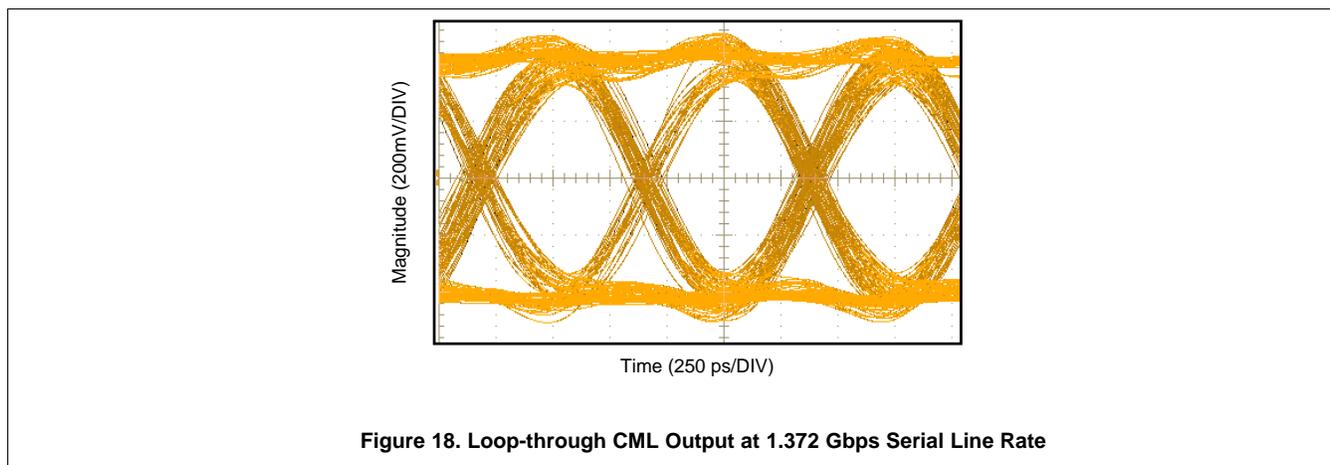

Figure 18. Loop-through CML Output at 1.372 Gbps Serial Line Rate

## 8 Power Supply Recommendations

### 8.1 Power Up Requirements and PDB Pin

The VDD ( $V_{DDn}$  and  $V_{DDIO}$ ) supply ramp should be faster than 1.5 ms with a monotonic rise. If slower than 1.5 ms then a capacitor on the PDB pin is needed to ensure PDB arrives after all the VDD have settled to the recommended operating voltage. When PDB pin is pulled to  $V_{DDIO}$ , it is recommended to use a 10 k $\Omega$  pull-up and a >10 uF cap to GND to delay the PDB input signal.

## 9 Layout

### 9.1 Layout Guidelines

#### 9.1.1 Transmission Media

The Ser/Des chipset is intended to be used in a point-to-point configuration, through a PCB trace, or through twisted pair cable. The Ser and Des provide internal terminations providing a clean signaling environment. The interconnect for LVDS should present a differential impedance of 100 Ohms. Use cables and connectors that have matched differential impedance to minimize impedance discontinuities. Shielded or un-shielded cables may be used depending upon the noise environment and application requirements.

#### 9.1.2 PCB Layout and Power System Considerations

Circuit board layout and stack-up for the LVDS Ser/Des devices should be designed to provide low-noise power feed to the device. Good layout practice will also separate high frequency or high-level inputs and outputs to minimize unwanted stray noise pickup, feedback and interference. Power system performance may be greatly improved by using thin dielectrics (2 to 4 mils) for power / ground sandwiches. This arrangement provides plane capacitance for the PCB power system with low-inductance parasitics, which has proven especially effective at high frequencies, and makes the value and placement of external bypass capacitors less critical. External bypass capacitors should include both RF ceramic and tantalum electrolytic types. RF capacitors may use values in the range of 0.01 uF to 0.1 uF. Tantalum capacitors may be in the 2.2 uF to 10 uF range. Voltage rating of the tantalum capacitors should be at least 5X the power supply voltage being used.

Surface mount capacitors are recommended due to their smaller parasitics. When using multiple capacitors per supply pin, locate the smaller value closer to the pin. A large bulk capacitor is recommended at the point of power entry. This is typically in the 50uF to 100uF range and will smooth low frequency switching noise. It is recommended to connect power and ground pins directly to the power and ground planes with bypass capacitors connected to the plane with via on both ends of the capacitor. Connecting power or ground pins to an external bypass capacitor will increase the inductance of the path.

A small body size X7R chip capacitor, such as 0603, is recommended for external bypass. Its small body size reduces the parasitic inductance of the capacitor. The user must pay attention to the resonance frequency of these external bypass capacitors, usually in the range of 20-30 MHz. To provide effective bypassing, multiple capacitors are often used to achieve low impedance between the supply rails over the frequency of interest. At high frequency, it is also a common practice to use two vias from power and ground pins to the planes, reducing the impedance at high frequency.

Some devices provide separate power and ground pins for different portions of the circuit. This is done to isolate switching noise effects between different circuit sections. Separate PCB planes are typically not required. Pin Description tables typically provide guidance on which circuit blocks are connected to which power pin pairs. In some cases, an external filter may be used to provide clean power to sensitive circuits such as PLLs.

Use at least a four layer board with a power and ground plane. Locate LVCMOS signals away from the LVDS lines to prevent coupling from the LVCMOS lines to the LVDS lines. Closely-coupled differential lines of 100 Ohms are typically recommended for LVDS interconnect. The closely coupled lines help to ensure that coupled noise will appear as common-mode and thus is rejected by the receivers. The tightly coupled lines will also radiate less.

Information on the WQFN style package is provided in Application Note: [AN-1187 / SNOA401](#).

## Layout Guidelines (continued)

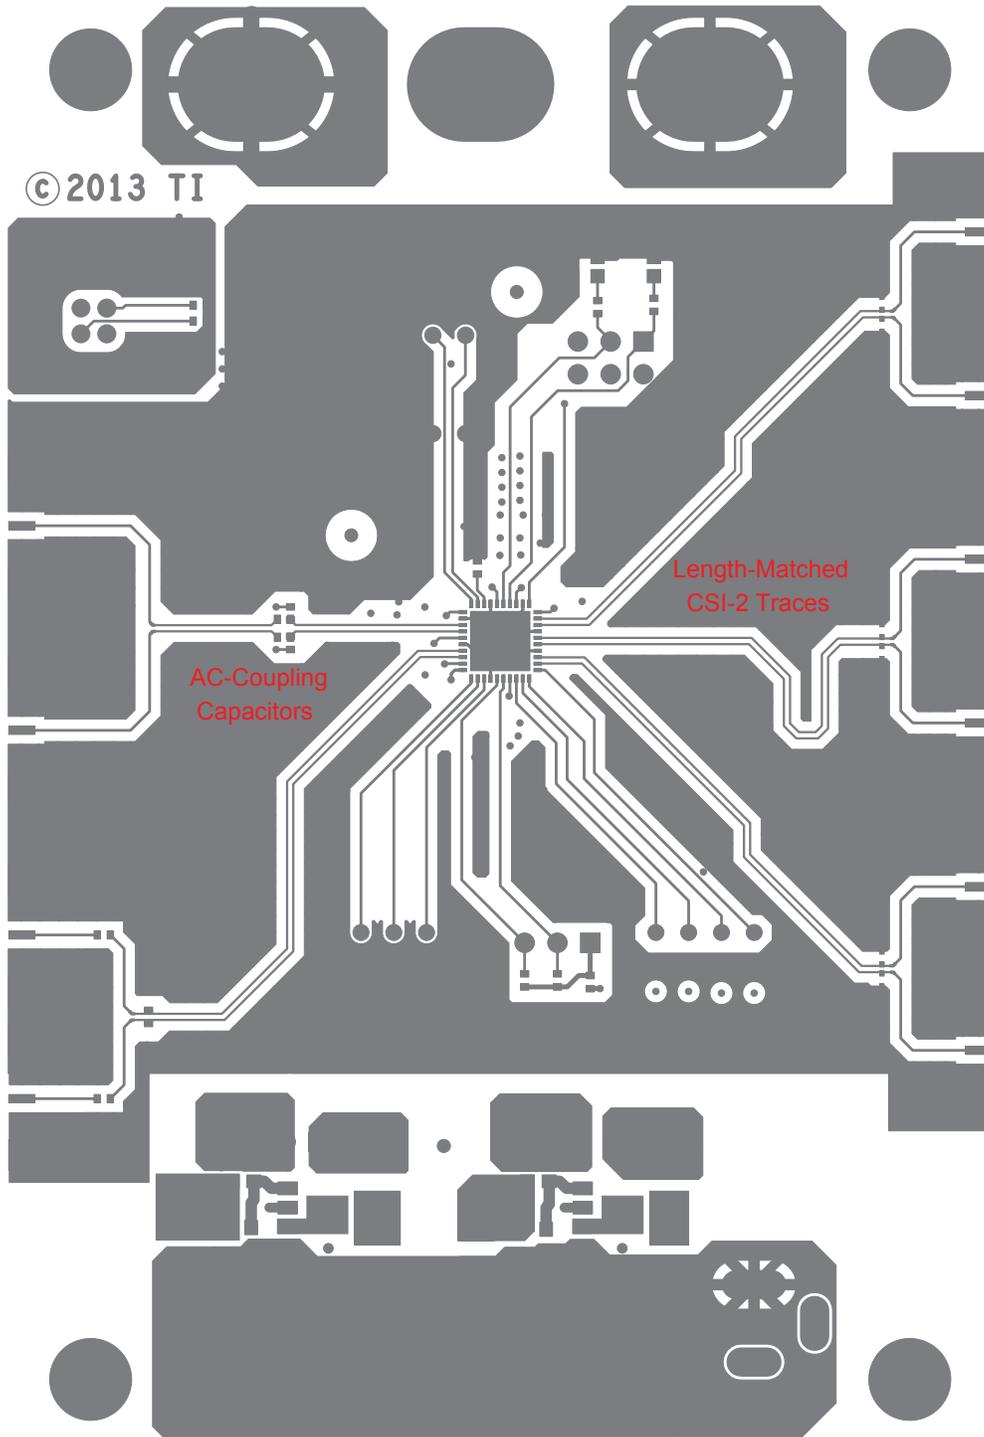

### 9.1.3 CSI-2 Guidelines

1. CS10\_D\*P/N and CS11\_D\*P/N pairs should be routed with controlled 100-Ohm differential impedance ( $\pm 20\%$ ) or 50-Ohm single-ended impedance ( $\pm 15\%$ )
2. Keep away from other high speed signals
3. Keep length difference between a differential pair to 5 mils max
4. Length matching should be near the location of mismatch.
5. Match trace lengths between pairs to be  $< 25$  mils.
6. Each pair should be separated at least by 3 times the signal trace width
7. The use of bends in differential traces should be kept to a minimum. When bends are used, the number of left and right bends should be as equal as possible and the angle of the bend should be  $\geq 135$  degrees. This arrangement minimizes any length mismatch caused by the bends and therefore minimizes the impact that bends have on EMI.
8. Route all differential pairs on the same layer
9. The number of VIAS should be kept to a minimum. It is recommended to keep the VIA count to 2 or less
10. Keep traces on layers adjacent to ground plane
11. Do NOT route differential pairs over any plane split
12. Adding Test points will cause impedance discontinuity and will therefore negatively impact signal performance. If test points are used, they should be placed in series and symmetrically. They must not be placed in a manner that causes a stub on the differential pair

## Layout Guidelines (continued)

### 9.1.5 LVDS Interconnect Guidelines

See [AN-1108](#) and [AN-905](#) for full details.

- Use 100Ω coupled differential pairs
- Use the S/2S/3S rule in spacings
  - S = space between the pair
  - 2S = space between pairs
  - 3S = space to LVCMOS signal
- Minimize the number of Vias and skew within the pair
- Use differential connectors when operating above 500 Mbps line speed
- Maintain balance of the traces
- Terminate as close to the TX outputs and RX inputs as possible

Additional general guidance can be found in the LVDS Owner's Manual - available in PDF format from the Texas Instruments web site at: [www.ti.com/lvds](http://www.ti.com/lvds)
