TPS22932B

# TPS22932B Low Input Voltage, Ultralow rON Load Switch With Configurable Enable Logic and Controlled Slew-Rate 

## 1 Features

- Input Voltage: 1.1 V to 3.6 V
- Ultralow ON-Resistance
- $\mathrm{r}_{\mathrm{ON}}=55 \mathrm{~m} \Omega$ at $\mathrm{V}_{\mathbb{I N}}=3.6 \mathrm{~V}$
- $\mathrm{r}_{\mathrm{ON}}=65 \mathrm{~m} \Omega$ at $\mathrm{V}_{\mathrm{IN}}=2.5 \mathrm{~V}$
- $\mathrm{r}_{\mathrm{ON}}=75 \mathrm{~m} \Omega$ at $\mathrm{V}_{\mathbb{I N}}=1.8 \mathrm{~V}$
- $r_{\mathrm{ON}}=115 \mathrm{~m} \Omega$ at $\mathrm{V}_{\mathrm{IN}}=1.2 \mathrm{~V}$
- $500-\mathrm{mA}$ Maximum Continuous Switch Current
- Quiescent Current $<1 \mu \mathrm{~A}$
- Shutdown Current $<1 \mu \mathrm{~A}$
- Low Control Threshold Allows Use of 1.2-V, 1.8-V, $2.5-\mathrm{V}$, and 3.3-V Logic
- Configurable Enable Logic
- Controlled Slew Rate to Avoid Inrush Currents: $165 \mu \mathrm{~s}$ at 1.8 V
- Six-Terminal Wafer Chip Scale Package (DSBGA)
- ESD Performance Tested Per JESD 22
- 2000-V Human-Body Model
(A114-B, Class II)
- 1000-V Charged-Device Model (C101)

## 2 Applications

- PDAs
- Cell Phones
- GPS Devices
- MP3 Players
- Digital Cameras
- Peripheral Ports
- Portable Instrumentation

## 3 Description

The TPS22932B device is a low $\mathrm{r}_{\mathrm{ON}}$ load switch with controlled turnon. The device contains a P-channel MOSFET that can operate over an input voltage range of 1.1 V to 3.6 V .
The switch is controlled by eight patterns of 3-bit input. The user can choose the logic functions MUX, AND, OR, NAND, NOR, inverter, and noninverter. All inputs can be connected to $\mathrm{V}_{\mathrm{IN}}$ or GND. The control pins can be connected to low-voltage GPIOs allowing the switch to be controlled by either $1.2-\mathrm{V}, 1.8-\mathrm{V}, 2.5-$ V, or 3.3-V logic signals while keeping extremely low quiescent current.
A 120- $\Omega$ on-chip load resistor is available for output quick discharge when the switch is turned off. The rise time (slew rate) of the device is internally controlled to avoid inrush current: the rise time of TPS22932B is $165 \mu \mathrm{~s}$.

TPS22932B is available in a space-saving 6-pin DSBGA (YFP with $0.4-\mathrm{mm}$ pitch). The device is characterized for operation over the free-air temperature range of $-40^{\circ} \mathrm{C}$ to $85^{\circ} \mathrm{C}$.

## 7 Specifications

### 7.1 Absolute Maximum Ratings

over operating free-air temperature range (unless otherwise noted) ${ }^{(1)}$

|  |  | MIN | MAX |
| :--- | :--- | :---: | :---: |
| $\mathrm{V}_{\text {IN }}$ | Input voltage | -0.3 | 4 |
| $\mathrm{~V}_{\text {OUT }}$ | Output voltage | $\mathrm{V}_{\text {IN }}+0.3$ | V |
| $\mathrm{I}_{\text {MAX }}$ | Maximum continuous switch current | 500 | mA |
| $\mathrm{~T}_{\text {lead }}$ | Maximum lead temperature (10-s soldering time) | 300 | ${ }^{\circ} \mathrm{C}$ |
| $\mathrm{T}_{\text {stg }}$ | Storage temperature | -65 | 150 |
| ${ }^{\circ} \mathrm{C}$ |  |  |  |

(1) Stresses beyond those listed under Absolute Maximum Ratings may cause permanent damage to the device. These are stress ratings only, which do not imply functional operation of the device at these or any other conditions beyond those indicated under Recommended Operating Conditions. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

### 7.2 ESD Ratings

|  |  | VALUE | UNIT |
| :---: | :---: | :---: | :---: |
|  | Human-body model (HBM), per ANSI/ESDA/JEDEC JS-001 ${ }^{(1)}$ | $\pm 2000$ |  |
| $\mathrm{V}_{(\text {ESD })}$ Electrostatic discharge | Charged-device model (CDM), per JEDEC specification JESD22C101 ${ }^{(2)}$ | $\pm 1000$ | V |

(1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.
(2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

### 7.3 Recommended Operating Conditions

over operating free-air temperature range (unless otherwise noted)

|  |  | MIN | MAX |
| :--- | :--- | :---: | :---: |

## 9 Detailed Description

### 9.1 Overview

TPS22932B is a single-channel, low $r_{\text {ON }}$ load switch with controlled turnon. The device contains a low $r_{\text {ON }}$ Pchannel MOSFET that can operate over an input voltage range of 1.1 V to 3.6 V . The switch is controlled by eight patterns of 3 -bit input. The user can choose the logic functions MUX, AND, OR, NAND, NOR, inverter, and noninverter. All inputs can be connected to VIN or GND. The control pins can be connected to low-voltage GPIOs allowing it to be controlled by either $1.2-\mathrm{V}, 1.8-\mathrm{V}, 2.5-\mathrm{V}$, or $3.3-\mathrm{V}$ logic signals while keeping extremely low quiescent current. A $120-\Omega$ on-chip load resistor is available for output quick discharge when the switch is turned off. The rise time (slew rate) of the device is internally controlled to avoid inrush current.

### 9.3.1 Configurable Logic Function

The switch is controlled by eight patterns of 3-bit input. The user can choose the logic functions MUX, AND, OR, NAND, NOR, inverter, and noninverter. All inputs can be connected to VIN or GND. The control pins can be connected to low-voltage GPIOs allowing it to be controlled by either $1.2-\mathrm{V}, 1.8-\mathrm{V}, 2.5-\mathrm{V}$, or $3.3-\mathrm{V}$ logic signals while keeping extremely low quiescent current.

### 9.3.2 Quick Output Discharge

The TPS22932B includes the Quick Output Discharge (QOD) feature. When the switch is disabled, a discharge resistance with a typical value of $120 \Omega$ is connected between the output and ground. This resistance pulls down the output and prevents it from floating when the device is disabled.

## 10 Application and Implementation

## NOTE

Information in the following applications sections is not part of the Tl component specification, and TI does not warrant its accuracy or completeness. Tl's customers are responsible for determining suitability of components for their purposes. Customers should validate and test their design implementation to confirm system functionality.

### 10.1 Application Information

### 10.1.1 ON and OFF Control

The ON pin controls the state of the switch. Activating ON continuously holds the switch in the on state so long as there is no fault. ON is active HI and has a low threshold making it capable of interfacing with low voltage signals. The ON pin is compatible with standard GPIO logic threshold. It can be used with any microcontroller with $1.2-\mathrm{V}, 1.8-\mathrm{V}, 2.5-\mathrm{V}$, or 3.3-V GPIOs.

### 10.1.2 Input Capacitor

To limit the voltage drop on the input supply caused by transient in-rush currents when the switch turns on into a discharged load capacitor or short-circuit, a capacitor must be placed between $\mathrm{V}_{\mathbb{I}}$ and GND. A $1-\mu \mathrm{F}$ ceramic capacitor, $\mathrm{C}_{\mathbb{N}}$, placed close to the pins is usually sufficient. Higher values of $\mathrm{C}_{\mathbb{N}}$ can be used to further reduce the voltage drop during higher current application. When switching a heavy load, TI recommends to have an input capacitor about 10 or more times higher than the output capacitor to avoid any supply drop.

### 10.1.3 Output Capacitor

Due to the integral body diode in the PMOS switch, a $\mathrm{C}_{\mathbb{I}}$ greater than $\mathrm{C}_{\mathrm{L}}$ is highly recommended. A $\mathrm{C}_{\llcorner }$greater than $\mathrm{C}_{\mathbb{I N}}$ can cause $\mathrm{V}_{\text {OUT }}$ to exceed $\mathrm{V}_{\mathbb{I N}}$ when the system supply is removed. This could result in current flow through the body diode from $\mathrm{V}_{\text {OUT }}$ to $\mathrm{V}_{\text {IN }}$.

### 10.2 Typical Application

A. Switched-mode power supply

Figure 39. Typical Application

### 10.2.1 Design Requirements

For this example, follow the design parameters listed in Table 3.
Table 3. Design Parameters

| DESIGN PARAMETERS | EXAMPLE VALUE |
| :---: | :---: |
| $\mathrm{V}_{\mathbb{I}}$ | 3.3 V |
| $\mathrm{C}_{\mathrm{L}}$ | $4.7 \mu \mathrm{~F}$ |
| Maximum Acceptable Inrush Current | 150 mA |

### 10.2.2 Detailed Design Procedure

### 10.2.2.1 VIN to VOUT Voltage Drop

The VIN to VOUT voltage drop in the device is determined by the ron of the device and the load current. The ron of the device depends upon the VIN condition of the device. Refer to the $r_{\text {ON }}$ specification of the device in the Electrical Characteristics table of this data sheet. When the ron of the device is determined based upon the VIN conditions, use Equation 1 to calculate the VIN to VOUT voltage drop:

$$
\Delta \mathrm{V}=\mathrm{I}_{\text {LOAD }} \times \mathrm{r}_{\mathrm{ON}}
$$

where

- $\Delta \mathrm{V}=$ Voltage drop from VIN to VOUT
- $\mathrm{I}_{\text {LOAD }}=$ Load current
- $r_{O N}=O N$-resistance of the device for a specific $V_{\mathbb{N}}$
- An appropriate $I_{\text {LOAD }}$ must be chosen such that the $I_{\text {MAX }}$ specification of the device is not violated.

### 10.2.2.2 Managing Inrush Current

When the switch is enabled, the output capacitors must be charged up from $0-\mathrm{V}$ to $\mathrm{V}_{\mathbb{I}}$. This charge arrives in the form of inrush current. Inrush current can be calculated using the following equation:

Inrush Current $=C \times \frac{d v}{d t}$
where

- $\mathrm{C}=$ Output capacitance
- $\frac{d v}{d t}=$ Output slew rate

The TPS22932B offers a very slow controlled rise time for minimizing inrush current. This device can be selected based upon the maximum acceptable slew rate which can be calculated using the design requirements and the inrush current equation. An output capacitance of $4.7 \mu \mathrm{~F}$ will be used because the amount of inrush increases with output capacitance:

$$
\begin{equation*}
150 \mathrm{~mA}=4.7 \mu \mathrm{~F} \times \frac{\mathrm{dv}}{\mathrm{dt}} \tag{3}
\end{equation*}
$$

$$
\begin{equation*}
\frac{\mathrm{dv}}{\mathrm{dt}}=31.9 \mathrm{~V} / \mathrm{ms} \tag{4}
\end{equation*}
$$

To ensure an inrush current of less than 150 mA , a device with a slew rate less than $31.9 \mathrm{~V} / \mathrm{ms}$ must be used.
The TPS22932B has a typical rise time of $145 \mu \mathrm{~s}$ at 3.3 V . This results in a slew rate of $22.8 \mathrm{~V} / \mathrm{ms}$ which meets the requirement.

### 10.2.3 Application Curve

Figure 40. TPS22932B Inrush Current With 4.7- $\mu \mathrm{F}$ Output Capacitor

## 11 Power Supply Recommendations

The device is designed to operate with a $\mathrm{V}_{\mathrm{IN}}$ range of 1.1 V to 3.6 V . This supply must be well regulated and placed as close to the device terminal as possible with the recommended $1-\mu \mathrm{F}$ bypass capacitor. If the supply is located more than a few inches from the device terminals, additional bulk capacitance may be required in addition to the ceramic bypass capacitors. If additional bulk capacitance is required, an electrolytic, tantalum, or ceramic capacitor of $10 \mu \mathrm{~F}$ may be sufficient.

## 12 Layout

### 12.1 Layout Guidelines

For best performance, all traces should be as short as possible. To be most effective, the input and output capacitors should be placed close to the device to minimize the effects that parasitic trace inductances may have on normal and short-circuit operation. Using wide traces for $\mathrm{V}_{\mathbb{I N}}, \mathrm{V}_{\text {OUT }}$, and $G N D$ will help minimize the parasitic electrical effects along with minimizing the case to ambient thermal impedance.

${ }^{(1)}$ The marketing status values are defined as follows:
ACTIVE: Product device recommended for new designs.
LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.
NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.
PREVIEW: Device has been announced but is not in production. Samples may or may not be available.
OBSOLETE: TI has discontinued the production of the device.
${ }^{(2)}$ RoHS: TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed $0.1 \%$ by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as " Pb -Free".
RoHS Exempt: TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.
Green: TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the $<=1000 \mathrm{ppm}$ threshold requirement.
${ }^{(3)}$ MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.
${ }^{(4)}$ There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.
${ }^{(5)}$ Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a " $\sim$ " will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.
${ }^{(6)}$ Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.
