# LM3639A 单芯片 40V 背光 +1.5 A 闪光发光二级管（LED）驱动器 

查询样品：LM3639A
## 特性

- 单芯片白光 LED 闪光和背光驱动器
- 1．5A 闪光 LED 电流
- 双灯串背光控制（ $V_{\text {输出最大值 }} \mathbf{4 0 V}$ ）
- 128 级指数和线性亮度控制
- 针对内容自适应亮度控制（CABC）的脉宽调制 （PWM）输入
- 可编程过压保护（背光）
- 可编程电流限制（闪光）
- 可编程开关频率
- 低电池电量情况下优化的闪光电流

## 应用范围

- 白光 LED 背光显示器电源
- 白光 LED 摄像头闪光电源

说明
LM3639A 是一款单片白光 LED 摄像头闪光驱动器＋ LCD 显示器背光驱动器。 低电压，高电流的闪光 LED驱动器是一款同步升压转换器，此转换器可为单个闪光 LED 提供高达 1．5A 的电流，或为双 LED 的每个 LED提供高达 750 mA 的电源。高电压背光驱动器具有双输出异步升压功能，可为双 LED 灯串的每个灯串提供高达 40 V 的电压和 30 mA 的电流。这两个升压转换器中的自适应稳压方法规定了各自拉电流／灌电流中的净空电压，以便在尽可能提高效率的同时确保 LED 电流保持稳定。 LM3639A 的闪光驱动器是用于高电流白光 LED 的 2 MHz 或 4 MHz 固定频率同步升压转换器及
1．5A 恒定电流驱动器。高侧电流源允许阴极接地 LED操作，从而提供高达 1.5 A 的闪光电流。自适应调节方法确保电流源保持可调节状态，并且大大提高了效率。

此器件由一个 ${ }^{2} \mathrm{C}$ 兼容接口控制。针对闪光 LED 驱动器的特性包括一个可由逻辑输入触发闪光脉冲的硬件闪光使能（STROBE），和一个用于与射频（RF）功率放大器事件或其他高电流情况同步的 TX 输入。 针对 LCD背光驱动器的特性包括一个用于内容可调背光控制的 PWM 输入， 128 个指数或线性亮度控制级，可编程过压保护和可选开关频率（ 500 kHz 至 1 MHz ）。

此器件采用微型 $1.790 \mathrm{~mm} \times 2.165 \mathrm{~mm} \times 0.6 \mathrm{~mm} 20$ 焊锡凸点， 0.4 mm 焊球间距芯片级球栅阵列（DSBGA）封装，运行温度范围介于 $-40^{\circ} \mathrm{C}$ 至 $+85^{\circ} \mathrm{C}$ 之间。

Please be aware that an important notice concerning availability，standard warranty，and use in critical applications of Texas Instruments semiconductor products and disclaimers thereto appears at the end of this data sheet． All trademarks are the property of their respective owners．

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.
ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

## Connection Diagram

Figure 1. 20 -Bump, 0.4 mm Pitch DSBGA Package YFQ0020HGA

PIN DESCRIPTIONS

| TERMINAL |  | I/O | DESCRIPTION |
| :---: | :---: | :---: | :---: |
| NAME | NO. |  |  |
| FLED1 | A1 | Output | High Side Current Source Output for Flash LED1. |
| FLED2 | B1 | Output | High Side Current Source Output for Flash LED2. |
| OUTF (x2) | A2/B2 | Output | Flash LED Boost Output. Connect a $10 \mu \mathrm{~F}$ ceramic capacitor between this pin GND. |
| SWF (x2) | A3/B3 | Output | Drain Connection for Internal NMOS and Synchronous PMOS Switches. Connect the Flash LED Boost Inductor to SWF. |
| GND ( x 3 ) | A4/B4/E3 |  | Ground |
| TX | C2 | Input | Power Amplifier Synchronization Input. The TX pin has a $300 \mathrm{k} \Omega$ pull-down resistor connected to GND. |
| STROBE | C3 | Input | Active High Hardware Flash Enable. Drive STROBE high to turn on Flash pulse. STROBE overrides TORCH. The STROBE pin has a $300 \mathrm{k} \Omega$ pulldown resistor connected to GND. |
| VIN | C4 | Input | Input Voltage Connection. Connect IN to the input supply, and bypass to GND with a $10 \mu \mathrm{~F}$ or larger ceramic capacitor. |
| SDA | D3 | Input | Serial Data Input/Output. |
| SCL | D2 | Input | Serial Clock Input. |
| EN | C1 | Input | Enable Pin. High = Standby, Low = Shutdown/Reset. |
| SWB | E4 | Input | Drain Connection for internal NFET. Connect SWB to the junction of the backlight boost inductor and the Schottky diode anode. |
| PWM | D4 | Input | PWM Brightness Control Input for backlight current control. The PWM pin has a $300 \mathrm{k} \Omega$ pull-down resistor connected to GND. |
| BLED1 | D1 | Input | Input Terminal to Backlight LED String Current Sink \#1 (40V max). The boost converter regulates the minimum of BLED1 and BLED2 to 400 mV . |
| BLED2 | E1 | Input | Input Terminal to Backlight LED String Current Sink \#2 (40V max). The boost converter regulates the minimum of BLED1 and BLED2 to 400 mV . |
| OVP | E2 | Input | Over-Voltage Sense Input for Backlight Boost. Connect to the positive terminal of (COUTB). |

## ABSOLUTE MAXIMUM RATINGS ${ }^{(1)}$

| VIN $^{(2) ~}{ }^{(3)}$ | -0.3 V to 6 V |
| :--- | ---: |
| SWF, OUTF, FLED1, FLED2, EN, PWM, SCL, SDA, TX, STROBE ${ }^{(2)}$ | -0.3 V to the lesser of $\left(\mathrm{V}_{\text {IN }}+0.3 \mathrm{~V}\right) \mathrm{w} / 6 \mathrm{~V}$ |
| max |  |
| SWB, OVP, BLED1, BLED2 ${ }^{(2)}$ | -0.3 V to +45 V |
| Storage Temperature Range | $-65^{\circ} \mathrm{C}$ to $+150^{\circ} \mathrm{C}$ |

(1) Absolute Maximum Ratings indicate limits beyond which damage to the device may occur. Operating Ratings are conditions under which operation of the device is ensured. Operating Ratings do not imply ensured performance limits. For ensured performance limits and associated test conditions, see the Electrical Characteristics table.
(2) All voltages are with respect to the potential at the GND pin.
(3) $\mathrm{V}_{\text {IN }}$ can be below -0.3 V if the current out of the pin is limited to $500 \mu \mathrm{~A}$.

OPERATING RATINGS ${ }^{(1)(2)}$

| $\mathrm{V}_{\mathrm{IN}}$ | 2.5 V to 5.5 V |
| :--- | ---: |
| Junction Temperature $\left(\mathrm{T}_{\mathrm{J}}\right)$ | $-40^{\circ} \mathrm{C}$ to $+125^{\circ} \mathrm{C}$ |
| Ambient Temperature $\left(\mathrm{T}_{\mathrm{A}}\right)^{(3)}$ | $-40^{\circ} \mathrm{C}$ to $+85^{\circ} \mathrm{C}$ |

(1) Absolute Maximum Ratings indicate limits beyond which damage to the device may occur. Operating Ratings are conditions under which operation of the device is ensured. Operating Ratings do not imply ensured performance limits. For ensured performance limits and associated test conditions, see the Electrical Characteristics table.
(2) All voltages are with respect to the potential at the GND pin.
(3) In applications where high power dissipation and/or poor package thermal resistance is present, the maximum ambient temperature may have to be derated. Maximum ambient temperature ( $T_{A-M A X}$ ) is dependent on the maximum operating junction temperature ( $T_{J-M A X-O P}=$ $+125^{\circ} \mathrm{C}$ ), the maximum power dissipation of the device in the application ( $\mathrm{P}_{\mathrm{D}-\mathrm{MAX}}$ ), and the junction-to-ambient thermal resistance of the part/package in the application ( $\theta_{J A}$ ), as given by the following equation: $T_{A-M A X}=T_{J-M A X-O P}-\left(\theta_{J A} \times P_{D-M A X}\right)$.

## THERMAL PROPERTIES

(1) Junction-to-ambient thermal resistance $\left(\theta_{\mathrm{JA}}\right)$ is taken from a thermal modeling result, performed under the conditions and guidelines set forth in the JEDEC standard JESD51-7. The test board is a 4-layer FR-4 board measuring $102 \mathrm{~mm} \times 76 \mathrm{~mm} \times 1.6 \mathrm{~mm}$ with a $2 \times 1$ array of thermal vias. The ground plane on the board is $50 \mathrm{~mm} \times 50 \mathrm{~mm}$. Thickness of copper layers are $36 \mu \mathrm{~m} / 18 \mu \mathrm{~m} / 18 \mu \mathrm{~m} / 36 \mu \mathrm{~m}$ ( $1.5 \mathrm{oz} / 1 \mathrm{oz} / 1 \mathrm{oz} / 1.5 \mathrm{oz}$ ). Ambient temperature in simulation is $22^{\circ} \mathrm{C}$ in still air. Power dissipation is 1 W . In applications where high maximum power dissipation exists special care must be paid to thermal dissipation issues.

## ELECTRICAL CHARACTERISTICS ${ }^{(1)}{ }^{(2)}$

Limits in standard typeface are for $\mathrm{T}_{\mathrm{A}}=+25^{\circ} \mathrm{C}$. Limits in boldface type apply over the full operating ambient temperature range $\left(-40^{\circ} \mathrm{C} \leq \mathrm{T}_{\mathrm{A}} \leq+85^{\circ} \mathrm{C}\right)$. Unless otherwise specified, $\mathrm{V}_{\mathrm{IN}}=3.6 \mathrm{~V}$.

## FUNCTIONAL DESCRIPTION

## Flash and Backlight Enable (EN)

The LM3639A operates from a 2.5 V to 5.5 V input voltage (IN). EN must be pulled high to bring the LM3639A out of shutdown. Once EN is high the flash driver and backlight driver can be enabled via the $\mathrm{I}^{2} \mathrm{C}$-compatible interface.

## Thermal Shutdown

The LM3639A features a thermal shutdown. When the die temperature reaches $140^{\circ} \mathrm{C}$ the flash boost, backlight boost, flash LED current sources, and backlight current sinks shut down.

## Flash LED Boost Operation

The LM3639A's low-voltage boost provides the power for a single flash LED at up to 1.5A or dual flash LEDs at up to 750 mA each. The device incorporates a 2 MHz or 4 MHz constant frequency-synchronous boost converter, and two high-side current sources to regulate the LED currents from a 2.5 V to 5.5 V input voltage range. The boost converter switches and maintains at least $\mathrm{V}_{\mathrm{HR}}$ across each of the current sources (FLED1 and FLED2). This minimum headroom voltage ensures that the current source remains in regulation. If the input voltage is above the LED voltage + current source headroom voltage, the device does not switch and turns the PFET on continuously (Pass mode). In Pass mode the difference between ( $V_{I N}-I_{\text {LED }} \times R_{\text {PMOS }}$ ) and the voltage across the LED is dropped across each of the current sources. The LM3639A has a hardware Flash Enable input (STROBE) and a Flash Interrupt input (TX) designed to interrupt the flash pulse during high battery current conditions. Both logic inputs have internal $300 \mathrm{k} \Omega$ (typ.) pull-down resistors to GND. Additional features of the LM3639A include an input voltage monitor that can reduce the Flash current (during $\mathrm{V}_{\mathbb{I N}}$ under voltage conditions). Control of the LM3639A's flash driver is done via the $\mathrm{I}^{2} \mathrm{C}$-compatible interface.

## Startup (Enabling the FLASH LED Boost)

On startup, when VOUT is less than VIN, the internal synchronous PFET turns on as a current source and delivers 200 mA (typ.) to the output capacitor. During this time the current source (LED) is off. When the voltage across the output capacitor reaches 2.2 V (typ.) the current sources will turn on. At turn-on the current sources will step through each FLASH or TORCH level until the target LED current is reached. This gives the device a controlled turn-on and limits inrush current from the VIN supply.
www.ti.com.cn

## Pass Mode

The LM3639A starts up in Pass Mode and stays there until Boost Mode is needed to maintain regulation. If the voltage difference between VOUT and VLED falls below VHR, the device switches to Boost Mode. In Pass Mode the boost converter does not switch, and the synchronous PFET turns fully on bringing VOUT up to VIN - ILED $x$ RPMOS.

## Flash Mode Currents

There are 16 programmable flash current levels for FLED1 and FLED2 from 46.875 mA to 750 mA . Flash mode is activated via the $I^{2} \mathrm{C}$-compatible interface or by pulling the STROBE pin HIGH (LOW if configured as ActiveLow). Once the Flash sequence is activated the current sources will ramp up to their programmed Flash current by stepping through all current steps until the programmed current is reached.

Table 1. Flash Current vs. Code

| Code $0000=46.875 \mathrm{~mA}$ |
| :---: |
| Code $0001=93.75 \mathrm{~mA}$ |
| Code $0010=140.625 \mathrm{~mA}$ |

| Code $1101=656.25 \mathrm{~mA}$ |
| Code $1110=703.125 \mathrm{~mA}$ |
| Code $1111=750 \mathrm{~mA}$ |

## Torch Mode

Torch mode is activated through the $I^{2} \mathrm{C}$-compatible interface setting or by the hardware STROBE input when the Strobe EN bit is set to ' 1 '. Once Torch mode is enabled the current sources will ramp up to the programmed Torch current level.

| Code $110=196.875 \mathrm{~mA}$ |
| Code $111=225 \mathrm{~mA}$ |

## Independent LED Control

The part has the ability to independently turn on and turn off the FLED1 or FLED2 current sources. The LED current is adjusted by writing to the Torch Brightness or Flash Brightness Registers. Both the FLED1 or FLED2 use the same target current level stored in the Torch Brightness and the Flash Brightness Registers. Both LED outputs use the same LED ramp step time.

## Power Amplifier Synchronization (TX)

The TX pin is a Power Amplifier Synchronization input. This is designed to reduce the flash LED currents and thus limit the battery-current during high battery current conditions such as PA transmit events. When the LM3639A is engaged in a Flash event and the TX pin is pulled high, the LED current is forced into Torch mode at the programmed Torch current setting. If the TX pin is then pulled low before the Flash pulse terminates, the LED current will return to the previous Flash current level. At the end of the Flash time-out, whether the TX pin is high or low, the LED current will turn off. The TX pin has a $300 \mathrm{k} \Omega$ pull-down resistor connected to GND.

## Input Voltage Flash Monitor (IVFM)

The LM3639A has the ability to adjust the flash current based upon the voltage level present at the VIN pin utilizing an Input Voltage Flash Monitor. The adjustable VIN Monitor threshold ranges from 2.5V to 3.2V in 100 mV steps. Depending on the option, the LM3639A will either transition the LED current to the programmed Torch current or shut down completely when the Input Voltage Monitor detects an input voltage drop lower than the threshold value.

## Flash LED Fault/Protections

## Flash Timeout

The Flash Timeout period sets the maximum amount of time that the Flash Currents is sourced from each of the current source (FLED1 and FLED2). The LM3639A has 32 timeout levels ranging 32 ms to 1024 ms in 32 ms steps. Flash Timeout only applies to the Flash Mode operation. In $I^{2} \mathrm{C}$-compatible Flash Mode, the flash period is equal to the timeout value. In Strobe Flash Mode, the flash period is set by the active duration of the Strobe pin if the duration is less than the timeout value. If the Strobe event lasts longer than the set flash timeout value, the flash event will terminate upon reach the timeout period.

## Over-Voltage Protection (OVP)

The output voltage is limited to typically 5.0 V (see $\mathrm{V}_{\text {ovp }} \mathrm{Spec}$ ). In situations such as an open LED, the LM3639A will raise the output voltage in order keep the LED current at its target value. When $\mathrm{V}_{\text {outr }}$ reaches 5.0 V (typ.) the over-voltage protection (OVP) comparator will trip and turn off the internal NFET. When Voutf falls below the " $\mathrm{V}_{\text {ovp }}$ Off Threshold", the LM3639A will begin switching again. The mode bits in the Enable Register (0x0A) are not cleared upon an OVP event.

## Current Limit

The LM3639A features selectable inductor current limits. When the inductor current limit is reached, the LM3639A will terminate the charging phase of the switching cycle. Since the current limit is sensed in the NMOS switch, there is no mechanism to limit the current when the device operates in Pass Mode. In Boost mode or Pass mode, if OUTF falls below 2.3 V , the part stops switching, and the PFET operates as a current source limiting the current to 200 mA . This prevents damage to the LM3639A and excessive current draw from the battery during output short-circuit conditions. Pulling additional current from the OUTF node during normal operation is not recommended.

## LED and/or OUTF Fault

The LM3639A determines an LED open condition if the OVP threshold is crossed at the OUTF pin while the device is in Flash or Torch mode. An LED short condition is determined if the voltage at LED goes below 500 mV (typ.) while the device is in Torch or Flash mode. There is a delay of $256 \mu \mathrm{~s}$ deglitch time before the LED flag is valid and 2.048 ms before the VOUT flag is valid. This delay is the time between when the Flash or Torch current is triggered and when the LED voltage and the output voltage are sampled.

## Backlight Boost Operation

The high-voltage boost converter provides power for the two current sinks (BLED1 and BLED2). The backlight boost operates using a $10 \mu \mathrm{H}$ to $22 \mu \mathrm{H}$ inductor and a $1 \mu \mathrm{~F}$ output capacitor. The selectable 500 kHz or 1 MHz switching frequency allows use of small external components and provides for high boost converter efficiency. When there are different voltage requirements in both high-voltage LED strings, the LM3639A's backlight boost will regulate the feedback point of the highest voltage string to 400 mV and drop the excess voltage of the lower voltage string across its current sink.

## Backlight Over-Voltage Protection

The output voltage protection is limited to typically $16 \mathrm{~V}, 24 \mathrm{~V}, 32 \mathrm{~V}$ or 40 V (see VOVP Spec). In situations such as an open LED, the LM3639A will raise the output voltage in order to keep the LED current at its target value. When VOUTB reaches the selected OVP level, the over-voltage comparator will trip and turn off the internal NFET. When VOUT falls below the "VOVP Off Threshold", the LM3639A will begin switching again. By default, the Backlight OVP flag in the Flag Register (0x0B, Bit7) will not be set upon hitting an OVP condition. To enable this reporting feature, the BL Flag Report bit (Register 0x09, Bit7) must be set to a '1'. The BL Flag Report function is intended for use in a factory environment to check for LED connectivity and is not intended for use during normal operation.

## Backlight LED Short Detection

The LM3639A features a Backlight LED short flag that indicates whether either of the BLEDx pins rise above (VIN-1V). This detection block can help detect whether one or more of the LEDs in a string have experienced a short when operating in a balanced dual-string LED configuration (ex: 2 strings of 5 is balanced. One string of 5 and one string of 4 is unbalanced). If one or more of the LEDs in a string become shorted, and either of the BLEDx pins rise above (VIN - 1V), the BLED1/2 Flag in the Flag register ( $0 x 0 \mathrm{~B}$, Bit2) will be set to a ' 1 '. By default this detection block is disabled. To enable this reporting feature, the BL Flag Report bit (Register 0x09, Bit7) must be set to a '1'. The BL Flag Report function is intended for use in a factory environment to check for LED connectivity and is not intended for use during normal operation.

## Backlight Current Sinks ( $\mathrm{B}_{\mathrm{LED} 1}$ and $\mathrm{B}_{\text {LED } 2}$ )

BLED1 and BLED2 control the current in the backlight boost LED strings. Each current sink has 3-bit full-scale current programmability and 7-bit brightness control. Either current sink can have its current set through a dedicated brightness register and be controlled via the PWM input.

## Backlight Boost Switching Frequency

The LM3639A's backlight boost converter can have a 500 kHz or 1 MHz switching frequency. For the 500 kHz switching frequency selection the inductor must be $22 \mu \mathrm{H}$. For the 1 MHz switching frequency selection the inductor can be $10 \mu \mathrm{H}$ or $22 \mu \mathrm{H}$.

## PWM Input

There is a single PWM input which can control the current in the backlight current sinks (BLED1/2). When the PWM input is enabled, the current becomes a function of the full-scale current, the brightness code, and the PWM input duty cycle. The PWM pin has a $300 \mathrm{k} \Omega$ pull-down resistor connected to GND.

## PWM Polarity

The PWM input can be programmed to have active high or active low polarity.

## Full-Scale Current

There are 8 (3-bit) separate full-scale current settings for the backlight current. The full-scale current is the maximum backlight current when the brightness code is at $100 \%$ (Code $0 \times 7 \mathrm{~F}$ ). The full-scale current vs full-scale current code is given by:
$I_{\text {LED }}$ Fullscale $=5 \mathrm{~mA}+($ CODE $\times 3.5 \mathrm{~mA})$
Table 3. Full-Scale Current vs. Code

| Code | Full Scale Current |
| :---: | :---: |
| 000 | 5 mA |
| 001 | 8.5 mA |
| $:$ | $:$ |
| 100 | 19 mA |
| $:$ | $:$ |
| 110 | 26 mA |
| 111 | 29.5 mA |

## LED Current Mapping Modes

The backlight current can be programmed for either exponential or linear mapping modes. These modes determine the transfer characteristic of backlight code to LED current. The brightness code selected for linear will always be forced to be equal to the exponential value. The brightness code for exponential will always be mapped to the linear code as well.

## Exponential Mapping

In exponential mapping mode the brightness code to backlight current transfer function is given by the equation:
where $I_{\text {LED fullscale }}$ is the full-scale LED current setting, Code is the backlight code in the brightness register, and $D_{\text {PWM }}$ is the PWM input duty cycle. In exponential mapping mode the current ramp (either up or down) appears to the human eye as a more uniform transition then the linear ramp. This is due to the logarithmic response of the eye. NOTE: Code ' 0 ' does not enable the boost or the current sinks and should not be used.

## Linear Mapping

In linear mapping mode the brightness code to backlight current has a linear relationship and follows the equation:

$$
\begin{equation*}
I_{\text {LED }}=I_{\text {LED_FULLSCALE }} \times \frac{1}{127} \times \text { Code } \times D_{\text {PWM }} \tag{3}
\end{equation*}
$$

where $I_{\text {LED fullscale }}$ is the full-scale LED current setting, Code is the backlight code in the brightness register, and $D_{\text {Pwm }}$ is the PWM input duty cycle. NOTE: Code ' 0 ' does not enable the boost or the current sinks and should not be used.

## LED Current Ramping

## Ramp-Up/Ramp-Down Step Time

The Ramp-Up step time is the time the LM3639A spends at each current step during the ramping up of the backlight LED current. The Ramp-Down step time is the time the LM3639A spends at each current step during the ramping down of the backlight LED current. There are 8 different Ramp-Up and 8 different Ramp-Down step times. The Ramp-Up and Ramp-Down step times are independently programmable, but not independently programmable for each backlight current sink. For example, programming a Ramp-Up or Ramp-Down time programs the same ramp time for the current in both BLED1 and BLED2.

Table 4. Ramp Times

| Code | Ramp-Up Step Time | Ramp-Down Step Time |
| :---: | :---: | :---: |
| 000 | $32 \mu \mathrm{~s}$ | $32 \mu \mathrm{~s}$ |
| 001 | 4.096 ms | 4.096 ms |
| 010 | 8.192 ms | 8.192 ms |
| 011 | 16.384 ms | 16.384 ms |
| 100 | 32.768 ms | 32.768 ms |
| 101 | 65.536 ms | 65.536 ms |
| 110 | 131.072 ms | 131.072 ms |
| 111 | 262.144 ms | 262.144 ms |

|  | [0] | THERMAL SHUTDOWN | $0=$ Normal |

## Notes

1. To initiate a flash event, the Flash EN bit must be set via $I^{2} \mathrm{C}$ (Reg $0 \times 0 \mathrm{~A}$, bit $1={ }^{\prime} 1$ '). Upon the termination of a flash event ( $I^{2} C$ Controlled or Strobe Controlled), the Flash EN bit in register 0x0A will automatically clear itself to ' 0 '. To restart a flash event, the Flash EN bit must be reset to a ' 1 ' via an $I^{2} \mathrm{C}$ write.
2. During Backlight Operation, registers $0 \times 02$ and $0 \times 03$ become READ-ONLY. To adjust the values of registers $0 \times 02$ and $0 \times 03$, the Backlight EN bit in register 0x0A must be set to a ' 0 ' first.
3. During Flash Operation, register 0x07 becomes READ-ONLY. To adjust the values of register 0x07, the Flash EN bit in register 0x0A must be set to a '0' first.
4. If a single Backlight string is used, the string must be connected to BLED1, and the BLED2 EN bit must be set to ' 0 '. BLED2 in this configuration should be left floating.
5. If a single Flash LED is going to be used without shorting FLED1 to FLED2, FLED1 must be used and the FLED2 EN bit must be set to a ' 0 '. FLED2 in this configuration should be left floating.

## Applications Information: Backlight

## Backlight Inductor Selection

The LM3639A is designed to work with a $10 \mu \mathrm{H}$ to $22 \mu \mathrm{H}$ inductor. When selecting the inductor, ensure that the saturation rating is high enough to accommodate the applications peak inductor current. The inductance value must also be large enough so that the peak inductor current is kept below the LM3639A's switch current limit. Table 5 lists various inductors that can be used with the LM3639A. The inductors with higher saturation currents are more suitable for applications with higher output currents or voltages (multiple strings). The smaller devices are geared toward single string applications with lower series LED counts.

## NOTE

For high LED count single string applications (greater than 9 LEDs), the 500 kHz switching frequency and a $22 \mu \mathrm{H}$ inductor must be used. For dual string applications with a maximum LED count of two strings of 7 LEDs, a $22 \mu \mathrm{H}$ inductor is required for use with the 500 kHz switching frequency, whereas a $10 \mu \mathrm{H}$ or a $22 \mu \mathrm{H}$ inductor can be used with the 1 MHz switching frequency.

Table 5. Inductors

| Manufacturer | Part Number | Value | Size | Current Rating | DC Resistance |
| :---: | :---: | :---: | :---: | :---: | :---: |
| TDK | VLF403212MT-220M | $22 \mu \mathrm{H}$ | $4 \mathrm{~mm} \times 3.2 \mathrm{~mm} \times 1.2 \mathrm{~mm}$ | 600 mA | $0.59 \Omega$ |

| Coilcraft | LPS4018-103ML | $10 \mu \mathrm{H}$ | $3.9 \mathrm{~mm} \times 3.9 \mathrm{~mm} \times 1.7 \mathrm{~mm}$ | 1100 mA | $0.2 \Omega$ |
| Coilcraft | LPS4018-223ML | $22 \mu \mathrm{H}$ | $3.9 \mathrm{~mm} \times 3.9 \mathrm{~mm} \times 1.7 \mathrm{~mm}$ | 700 mA | $0.36 \Omega$ |

## Backlight Output Capacitor Selection

The LM3639A's output capacitor has two functions: to filter the boost converter's switching ripple, and to ensure feedback loop stability. As a filter, the output capacitor supplies the LED current during the boost converter's on time and absorbs the inductor's energy during the switch's off time. This causes a sag in the output voltage during the on time and a rise in the output voltage during the off time. Because of this, the output capacitor must be sized large enough to filter the inductor current ripple that could cause the output voltage ripple to become excessive. As a feedback loop component, the output capacitor must be at least $1 \mu \mathrm{~F}$ and have low ESR; otherwise, the LM3639A's boost converter can become unstable. This requires the use of ceramic output capacitors. Table 6 lists part numbers and voltage ratings for different output capacitors that can be used with the LM3639A.

## NOTE

For all LED applications, it is required that at least $0.4 \mu \mathrm{~F}$ of capacitance is present at the output of the backlight boost converter. Please refer to the output capacitor data sheets to find the effective capacitance (taking into account the DC Bias effect) of the capacitors at the target application output voltage.

Table 6. Output Capacitors

| Manufacturer | Part Number | Value | Size | Rating | Description |
| :---: | :---: | :---: | :---: | :---: | :---: |
| TDK | CGA4J3X7R1H105K | $1 \mu \mathrm{~F}$ | 0805 | 50 V | COUT |
| Murata | GRM21BR71H105KA12 | $1 \mu \mathrm{~F}$ | 0805 | 50 V | COUT |

## Backlight Diode Selection

The diode connected between SW and OUT must be a Schottky diode and have a reverse breakdown voltage high enough to handle the maximum output voltage in the application. Table 7 lists various diodes that can be used with the LM3639A.

Table 7. Diodes

| Manufacturer | Part Number | Value | Size | Rating |
| :---: | :---: | :---: | :---: | :---: |
| Diodes Inc. | B0540WS | Schottky | SOD-323 | $40 \mathrm{~V} / 500 \mathrm{~mA}$ |
| Diodes Inc. | SDM20U40 | Schottky | SOD-523 $(1.2 \mathrm{~mm} \times 0.8 \mathrm{~mm} \times 0.6 \mathrm{~mm})$ | $40 \mathrm{~V} / 200 \mathrm{~mA}$ |
| On Semiconductor | NSR0340V2T1G | Schottky | SOD-523 $(1.2 \mathrm{~mm} \times 0.8 \mathrm{~mm} \times 0.6 \mathrm{~mm})$ | $40 \mathrm{~V} / 250 \mathrm{~mA}$ |
| On Semiconductor | NSR0240V2T1G | Schottky | SOD-523 $(1.2 \mathrm{~mm} \times 0.8 \mathrm{~mm} \times 0.6 \mathrm{~mm})$ | $40 \mathrm{~V} / 250 \mathrm{~mA}$ |

## Backlight Layout Guidelines

The LM3639A contains an inductive boost converter which sees a high switched voltage (up to 40V) at the SWB pin, and a step current (up to 1A) through the Schottky diode and output capacitor each switching cycle. The high switching voltage can create interference into nearby nodes due to electric field coupling ( $\mathrm{I}=\mathrm{CdV} / \mathrm{dt}$ ). The large step current through the diode and the output capacitor can cause a large voltage spike at the SW pin and the OVP pin due to parasitic inductance in the step current conducting path ( $\mathrm{V}=\mathrm{Ldl} / \mathrm{dt}$ ). Board layout guidelines are geared towards minimizing this electric field coupling and conducted noise. Figure 40 highlights these two noise generating components.

Figure 40. LM3639A's Boost Converter Showing Pulsed Voltage at SW (High dV/dt) and Current Through Schottky and COUT (High dl/dt)

The following lists the main (layout sensitive) areas of the LM3639A in order of decreasing importance:
Output Capacitor

- Schottky Cathode to COUTB+
- COUTB- to GND

Schottky Diode

- SWB Pin to Schottky Anode
- Schottky Cathode to COUTB+ Inductor
- SWB Node PCB capacitance to other traces

Input Capacitor

- CIN+ to VIN pin
- CIN- to GND

## Backlight Output Capacitor Placement

The output capacitor is in the path of the inductor current discharge current. As a result, Couts sees a high current step from 0 to $I_{\text {PEAK }}$ each time the switch turns off and the Schottky diode turns on. Typical turn-off/turnon times are around 5 ns. Any inductance along this series path from the cathode of the diode through $\mathrm{C}_{\text {outb }}$ and back into the LM3639A's GND pin will contribute to voltage spikes ( $\left.V_{\text {SPIIE }}=L_{P X} \times d / / d t\right)$ at SWB and OUTB which can potentially over-voltage the SWB pin, or feed through to GND. To avoid this, Coutb+ must be connected as close as possible to the cathode of the Schottky diode, and $\mathrm{C}_{\text {OUT }}$ - must be connected as close as possible to the LM3639A's GND bump. The best placement for Couts is on the same layer as the LM3639A to avoid any vias that will add extra series inductance.

## Schottky Diode Placement

The Schottky diode is in the path of the inductor current discharge. As a result the Schottky diode sees a high current step from 0 to $I_{\text {PEAK }}$ each time the switch turns off and the diode turns on. Any inductance in series with the diode will cause a voltage spike ( $\mathrm{V}_{\text {SPIKE }}=\mathrm{L}_{\mathrm{PX}} \times \mathrm{dl} / \mathrm{dt}$ ) at SW and OUT which can potentially over-voltage the SW pin, or feed through to VOUT and through the output capacitor and into GND. Connecting the anode of the diode as close as possible to the SW pin and the cathode of the diode as close as possible to COUT+ will reduce the inductance ( $L_{P X}$ ) and minimize these voltage spikes.

## Backlight Inductor Placement

The node where the inductor connects to the LM3639A's SW bump presents two challenges. First, a large switched voltage ( 0 to $\mathrm{V}_{\text {OUt }}+\mathrm{V}_{\text {F_SchотткY }}$ ) appears on this node every switching cycle. This switched voltage can be capacitively coupled into nearby nodes. Second, there is a relatively large current (input current) on the traces connecting the input supply to the inductor and connecting the inductor to the SW bump. Any resistance in this path can cause large voltage drops that will negatively affect efficiency.
To reduce the capacitively coupled signal from SWB into nearby traces, the SW bump-to-inductor connection must be minimized in area. This limits the PCB capacitance from SW to other traces. Additionally, other nodes need to be routed away from SWB and not directly beneath. This is especially true for high-impedance nodes that are more susceptible to capacitive coupling such as (SCL, SDA, EN, PWM). A GND plane placed directly below SWB will help isolate SWB and dramatically reduce the capacitance from SW into nearby traces.
To limit the trace resistance of the VBATT-to-inductor connection and from the inductor-to-SW connection, use short, wide traces.

## Input Capacitor Selection and Placement

The input bypass capacitor filters the inductor current ripple, and the internal MOSFET driver currents, during turn-on of the power switch.
The driver current requirement can be a few hundred mAs with 5 ns rise and fall times. This will appear as high $\mathrm{dl} / \mathrm{dt}$ current pulses coming from the input capacitor each time the switch turns on. Close placement of the input capacitor to the IN pin and to the GND pin is critical since any series inductance between VIN and $\mathrm{C}_{\mathbb{N}^{+}}$or $\mathrm{C}_{\mathbb{I N}^{-}}$ and GND can create voltage spikes that could appear on the $\mathrm{V}_{\mathbb{I N}}$ supply line and in the GND plane.

Close placement of the input bypass capacitor at the input side of the inductor is also critical. The source impedance (inductance and resistance) from the input supply, along with the input capacitor of the LM3639A, form a series RLC circuit. If the output resistance from the source $\left(R_{S}\right)$ is low enough the circuit will be underdamped and will have a resonant frequency (typically the case). Depending on the size of $\mathrm{L}_{\mathrm{s}}$ the resonant frequency could occur below, close to, or above the LM3639A's switching frequency. This can cause the supply current ripple to be:

- approximately equal to the inductor current ripple when the resonant frequency occurs well above the LM3639A's switching frequency;
- greater then the inductor current ripple when the resonant frequency occurs near the switching frequency; or
- less then the inductor current ripple when the resonant frequency occurs well below the switching frequency.

Figure 41 shows the series RLC circuit formed from the output impedance of the supply and the input capacitor. The circuit is re-drawn for the AC case where the $\mathrm{V}_{\mathbb{I N}}$ supply is replaced with a short to GND, and the LM3639A + Inductor is replaced with a current source ( $\Delta I_{\mathrm{L}}$ ).

Equation 1 is the criteria for an underdamped response. Equation 2 is the resonant frequency. Equation 3 is the approximated supply current ripple as a function of $\mathrm{L}_{\mathrm{s}}, \mathrm{R}_{\mathrm{S}}$, and $\mathrm{C}_{\mathrm{IN}}$.
As an example, consider a 3.6 V supply with $0.1 \Omega$ of series resistance connected to $\mathrm{C}_{\mathbb{N}}$ through 50 nH of connecting traces. This results in an underdamped input filter circuit with a resonant frequency of 712 kHz . Since the switching frequency lies near to the resonant frequency of the input RLC network, the supply current is probably larger then the inductor current ripple. In this case, using Equation 3 from Figure 41, the supply current ripple can be approximated as 1.68 times the inductor current ripple. Increasing the series inductance $\left(\mathrm{L}_{\mathrm{s}}\right)$ to 500 nH causes the resonant frequency to move to around 225 kHz and the supply current ripple to be approximately 0.25 times the inductor current ripple.

Figure 41. Input RLC Network

## Applications Information: Flash

## Output Capacitor Selection

The LM3639A's flash boost converter is designed to operate with a ceramic output capacitor of at least $10 \mu \mathrm{~F}$. When the boost converter is running, the output capacitor supplies the load current during the boost converter's on-time. When the NMOS switch turns off, the inductor energy is discharged through the internal PMOS switch, supplying power to the load and restoring charge to the output capacitor. This causes a sag in the output voltage during the on-time and a rise in the output voltage during the off-time. The output capacitor is therefore chosen to limit the output ripple to an acceptable level depending on load current and input/output voltage differentials and also to ensure the converter remains stable.
Larger capacitors such as a $22 \mu \mathrm{~F}$ or capacitors in parallel can be used if lower output voltage ripple is desired. To estimate the output voltage ripple considering the ripple due to capacitor discharge $\left(\Delta \mathrm{V}_{\mathrm{Q}}\right)$ and the ripple due to the capacitors $\operatorname{ESR}\left(\Delta \mathrm{V}_{\mathrm{ESR}}\right)$ use the following equations:
For continuous conduction mode, the output voltage ripple due to the capacitor discharge is:

$$
\begin{equation*}
\Delta V_{Q}=\frac{\mathrm{I}_{\text {LED }} \times\left(\mathrm{V}_{\text {OUT }}-\mathrm{V}_{\text {IN }}\right)}{\mathrm{f}_{\mathrm{SW}} \times \mathrm{V}_{\text {OUT }} \times \mathrm{C}_{\text {OUT }}} \tag{4}
\end{equation*}
$$

The output voltage ripple due to the output capacitors ESR is found by:

$$
\Delta \mathrm{V}_{\mathrm{ESR}}=\mathrm{R}_{\mathrm{ESR}} \times\left(\frac{\mathrm{I}_{\mathrm{LED}} \times \mathrm{V}_{\mathrm{OUT}}}{\mathrm{~V}_{\mathrm{IN}}}\right)+\Delta \mathrm{I}_{\mathrm{L}}
$$

$$
\begin{equation*}
\text { where } \quad \Delta \mathrm{I}_{\mathrm{L}}=\frac{\mathrm{V}_{\mathrm{IN}} \times\left(\mathrm{V}_{\mathrm{OUT}}-\mathrm{V}_{\mathrm{IN}}\right)}{2 \times \mathrm{f}_{\mathrm{SW}} \times \mathrm{L} \times \mathrm{V}_{\mathrm{OUT}}} \tag{5}
\end{equation*}
$$

In ceramic capacitors the ESR is very low so the assumption is that $80 \%$ of the output voltage ripple is due to capacitor discharge and $20 \%$ from ESR. Table 8 lists different manufacturers for various output capacitors and their case sizes suitable for use with the LM3639A.

## Input Capacitor Selection

Choosing the correct size and type of input capacitor helps minimize the voltage ripple caused by the switching of the LM3639A's boost converter, and reduces noise on the boost converter's input terminal that can feed through and disrupt internal analog signals. In the Typical Application Circuit a $10 \mu \mathrm{~F}$ ceramic input capacitor works well. It is important to place the input capacitor as close as possible to the LM3639A's input (IN) terminal. This reduces the series resistance and inductance that can inject noise into the device due to the input switching currents. The table below lists various input capacitors recommended for use with the LM3639A.

Table 8. Recommended Flash Input/Output Capacitors (X5R/X7R Dielectric)

| Manufacturer | Part Number | Value | Case Size | Voltage Rating |
| :--- | :---: | :---: | :---: | :---: |
| Murata | GRM155R60J106ME44D | $10 \mu \mathrm{~F}$ | $0402(1 \mathrm{~mm} \times 0.5 \mathrm{~mm} \times 0.5 \mathrm{~mm})$ | 6.3 V |
| TDK Corporation | C1608JB0J106M | $10 \mu \mathrm{~F}$ | $0603(1.6 \mathrm{~mm} \times 0.8 \mathrm{~mm} \times 0.8 \mathrm{~mm})$ | 6.3 V |
| TDK Corporation | C2012JB1A106M | $10 \mu \mathrm{~F}$ | $0805(2 \mathrm{~mm} \times 1.25 \mathrm{~mm} \times 1.25 \mathrm{~mm})$ | 10 V |
| Murata | GRM188R60J106M | $10 \mu \mathrm{~F}$ | $0603(1.6 \mathrm{~mm} \times 0.8 \mathrm{~mm} \times 0.8 \mathrm{~mm})$ | 6.3 V |
| Murata | GRM21BR61A106KE19 | $10 \mu \mathrm{~F}$ | $0805(2 \mathrm{~mm} \times 1.25 \mathrm{~mm} \times 1.25 \mathrm{~mm})$ | 10 V |

## Inductor Selection

The LM3639A's flash boost is designed to use a $1 \mu \mathrm{H}$ or $0.47 \mu \mathrm{H}$ inductor. Table 9 below lists various inductors and their manufacturers that work well with the LM3639A. When the device is boosting $\left(\mathrm{V}_{\text {OUT }}>\mathrm{V}_{\text {IN }}\right)$ the inductor will typically be the largest area of efficiency loss in the circuit. Therefore, choosing an inductor with the lowest possible series resistance is important. Additionally, the saturation rating of the inductor should be greater than the maximum operating peak current of the LM3639A. This prevents excess efficiency loss that can occur with inductors that operate in saturation. For proper inductor operation and circuit performance, ensure that the inductor saturation and the peak current limit setting of the LM3639A are greater than $\mathrm{I}_{\text {PEAK }}$ in the following calculation:

$$
\begin{equation*}
\mathrm{I}_{\text {PEAK }}=\frac{\mathrm{I}_{\mathrm{LOAD}}}{\eta} \times \frac{\mathrm{V}_{\mathrm{OUT}}}{\mathrm{~V}_{\mathrm{IN}}}+\Delta \mathrm{I}_{\mathrm{L}} \quad \text { where } \quad \Delta \mathrm{I}_{\mathrm{L}}=\frac{\mathrm{V}_{\mathrm{IN}} \times\left(\mathrm{V}_{\mathrm{OUT}}-\mathrm{V}_{\mathrm{IN}}\right)}{2 \times f_{\mathrm{SW}} \times L \times \mathrm{V}_{\mathrm{OUT}}} \tag{6}
\end{equation*}
$$

where $f_{\mathrm{Sw}}=4 \mathrm{MHz}$ or 2 MHz , and efficiency can be found in the Typical Performance Characteristics plots.
Table 9. Recommended Inductors

| Manufacturer | $\mathbf{L}$ | Part Number | Dimensions (LxWxH) | $\mathbf{I}_{\text {SAT }}$ | $\mathbf{R}_{\mathbf{D C}}$ |
| :---: | :---: | :---: | :---: | :---: | :---: |
| TOKO | $*$ | DFE201612C-H-1ROM | $2 \mathrm{~mm} \times 1.6 \mathrm{~mm} \times 1.2 \mathrm{~mm}$ | 3.1 A | $68 \mathrm{~m} \Omega$ |
|  |  | DFE252010C | $2.5 \mathrm{~mm} \times 2 \mathrm{~mm} \times 1 \mathrm{~mm}$ | 3.4 A | $60 \mathrm{~m} \Omega$ |
|  |  | DFE252012C | $2.5 \mathrm{~mm} \times 2 \mathrm{~mm} \times 1.2 \mathrm{~mm}$ | 3.8 A | $45 \mathrm{~m} \Omega$ |

## Flash Layout Recommendations

The high switching frequency and large switching currents of the LM3639A make the choice of layout important. The following steps should be used as a reference to ensure the device is stable and maintains proper LED current regulation across its intended operating voltage and current range.

1. Place $\mathrm{C}_{\mathrm{IN}}$ on the top layer (same layer as the LM3639A) and as close to the device as possible. The input capacitor conducts the driver currents during the low-side MOSFET turn-on and turn-off and can see current spikes over 1A in amplitude. Connecting the input capacitor through short, wide traces to both the VIN and GND terminals will reduce the inductive voltage spikes that occur during switching which can corrupt the $\mathrm{V}_{\text {IN }}$ line.
2. Place $\mathrm{C}_{\text {outf }}$ on the top layer (same layer as the LM3639A) and as close as possible to the OUTF and GND terminals. The returns for both $\mathrm{C}_{\mathbb{I N}}$ and $\mathrm{C}_{\text {OUTF }}$ should come together at one point, as close to the GND pin as possible. Connecting Coutf through short, wide traces will reduce the series inductance on the OUTF and GND terminals that can corrupt the $\mathrm{V}_{\text {OUTF }}$ and GND lines and cause excessive noise in the device and surrounding circuitry.
3. Connect the inductor on the top layer close to the SWF pin. There should be a low-impedance connection from the inductor to SWF due to the large DC inductor current, and at the same time the area occupied by the SW node should be small to reduce the capacitive coupling of the high dV/dt present at SW that can couple into nearby traces.
4. Avoid routing logic traces near the SWF node to avoid any capacitively coupled voltages from SW onto any high-impedance logic lines such as STROBE, EN, TX, PWM, SDA, and SCL. A good approach is to insert an inner layer GND plane underneath the SWF node and between any nearby routed traces. This creates a shield from the electric field generated at SW.
5. Terminate the Flash LED cathodes directly to the GND pin of the LM3639A. If possible, route the LED returns with a dedicated path to keep the high amplitude LED currents out of the GND plane. For Flash LEDs that are routed relatively far away from the LM3639A, a good approach is to sandwich the forward and return current paths over the top of each other on two layers. This will help reduce the inductance of the LED current paths.

## PACKAGING INFORMATION

| Orderable Device | Status <br> (1) | Package Type | Package Drawing | Pins | Package Qty | Eco Plan <br> (2) | Lead finish/ Ball material (6) | MSL Peak Temp <br> (3) | Op Temp ( ${ }^{\circ} \mathrm{C}$ ) | Device Marking <br> (4/5) | Samples |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| LM3639AYFQR | ACTIVE | DSBGA | YFQ | 20 | 3000 | RoHS \& Green | SNAGCU | Level-1-260C-UNLIM | -40 to 85 | 363A | Samples |
| LM3639AYFQT | ACTIVE | DSBGA | YFQ | 20 | 250 | RoHS \& Green | SNAGCU | Level-1-260C-UNLIM | -40 to 85 | 363A | Samples |

${ }^{(1)}$ The marketing status values are defined as follows:
ACTIVE: Product device recommended for new designs.
LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.
NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.
PREVIEW: Device has been announced but is not in production. Samples may or may not be available.
OBSOLETE: TI has discontinued the production of the device.
${ }^{(2)}$ RoHS: TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed $0.1 \%$ by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as " Pb -Free".
RoHS Exempt: TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.
Green: TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the $<=1000 \mathrm{ppm}$ threshold requirement.
${ }^{(3)}$ MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.
${ }^{(4)}$ There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.
${ }^{(5)}$ Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a " $\sim$ " will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.
${ }^{(6)}$ Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.
