CDCVF25081 3.3V 锁相环时钟驱动器

1 特性

- 基于锁相环的零延迟缓冲器
  - 1 个时钟输入，2 组 4 个输出
  - 无需外部 RC 网络
- 电源电压：3V 至 3.6V
- 工作频率：8 MHz 至 200 MHz
- 低附加抖动（逐周期）：在 66MHz 至 200MHz 频率下为 ±100ps
- 支持断电模式
  - 电流消耗：< 20μA

    断电模式
- 25Ω 片上串联阻尼电阻器
- 工业温度范围：–40°C 至 85°C
- 与扩频时钟兼容 (SSC)
- 封装采用
  - 9.9mm × 3.91mm 16 引脚 SOIC (D)
  - 5.0mm × 4.4mm 16 引脚 TSSOP (PW)

2 应用

- 国防无线电
- 量产开关和混频器
- 雷达
- 体外诊断
- CT 和 PET 扫描仪

3 说明

CDCVF25081 是一款高性能、低偏差、低抖动锁相环时钟驱动器。它使用 PLL 根据输入时钟信号对输出时钟的频率和相位进行精准校准。输出分为 2 组，共 8 个缓冲 CLKIN 输出。当不存在 CLKIN 信号时，器件会自动将输出置于低电平状态（关断模式）。

S1 和 S2 引脚允许选择 PLL 或旁路 PLL 输出。保持开路时，输出将禁用为逻辑低电平状态。

该器件支持失效防护功能。该器件还整合了输入迟滞，可防止在没有输入信号的情况下输出随机振荡。

该器件可在 3.3V 电源环境下工作，额定温度范围是 –40°C 至 85°C（环境温度）。

表 5-1. Pin Functions

PIN		I/O TYPE(1)	DESCRIPTION
NAME	NO.		
INPUT CLOCK			
CLKIN	1	I	Clock input. CLKIN must have a fixed frequency and phase in order for the PLL to acquire lock. Once the circuit is powered up and a valid signal is applied, a stabilization time is required for the PLL to phase lock the feedback signal to CLKIN.
INPUT SELECT			
S1, S2	9, 8	I	Input Selection. Selects input port. (See 表 8-2.)
FEEDBACK			
FBIN	16	I	Feedback input. FBIN provides the feedback signal to the internal PLL. FBIN must be wired to one of the outputs to complete the feedback loop of the internal PLL. The integrated PLL synchronizes the FBIN and output signal so there is nominally zero-delay from input clock to output clock.
OUTPUT CLOCKS			
1Y0	2	O	Bank 1 Y0 clock output with an integrated 25-Ω series-damping resistor.
1Y1	3	O	Bank 1 Y1 clock output with an integrated 25-Ω series-damping resistor.

(1) Operation outside the *Absolute Maximum Ratings* may cause permanent device damage. *Absolute Maximum Ratings* do not imply functional operation of the device at these or any other conditions beyond those listed under *Recommended Operating Conditions*. If used outside the *Recommended Operating Conditions* but within the *Absolute Maximum Ratings*, the device may not be fully functional, and this may affect device reliability, functionality, performance, and shorten the device lifetime.
(2) The input and output negative voltage ratings may be exceeded if the input and output clamp-current ratings are observed.
(3) This value is limited to 4.6 V maximum.
(4) The package thermal impedance is calculated in accordance with JESD 51.

6.2 ESD Ratings

			VALUE	UNIT
$V_{(ESD)}$	Electrostatic discharge	Human body model (HBM), per ANSI/ESDA/JEDEC JS-001, all pins(1)	±2000	V
		Charged device model (CDM), per JEDEC specification JESD22-C101, all pins(2)	±1000	

(1) JEDEC document JEP155 states that 500-V HBM allows safe manufacturing with a standard ESD control process.
(2) JEDEC document JEP157 states that 250-V CDM allows safe manufacturing with a standard ESD control process.

8 Detailed Description

8.1 Overview

The CDCVF25081 is a low jitter, low skew, phase-locked loop clock buffer solution. Unlike many products containing PLLs, the CDCVF25081 does not require an external RC network. The loop filter for the PLL is included on-chip, minimizing component count, space, and cost. Two banks of four outputs each provide buffered copies of the CLKIN.

8.2 Functional Block Diagram

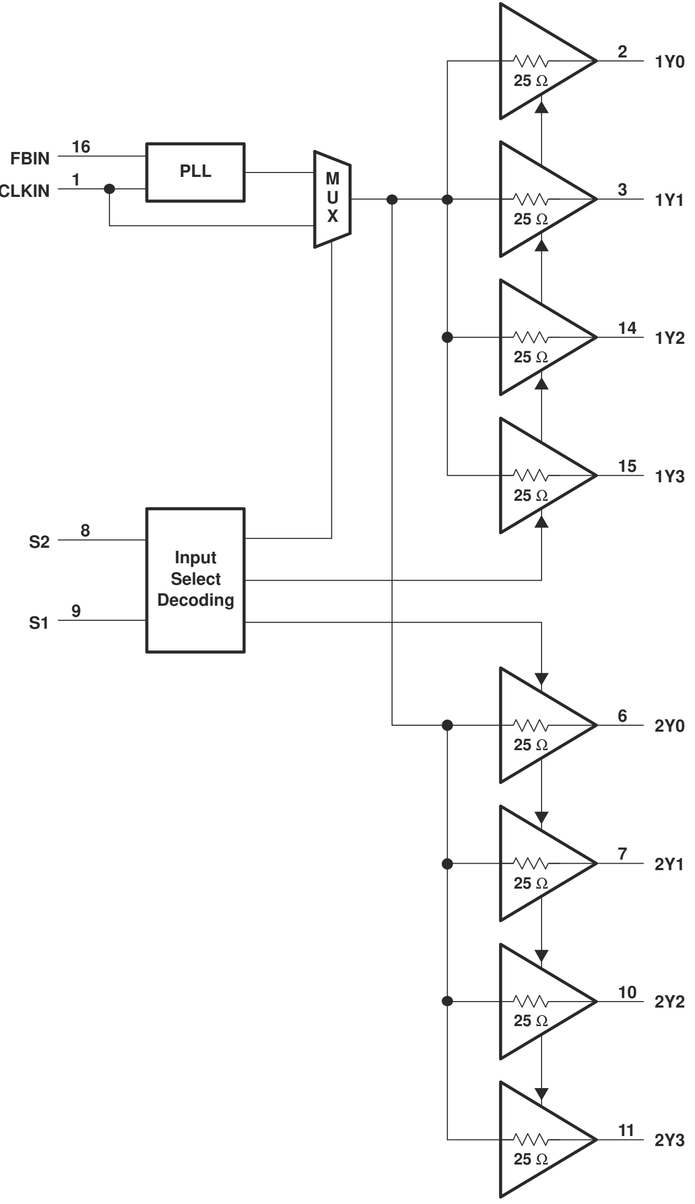

图 8-1. Functional Block Diagram

8.3 Feature Description

The CDCVF25081 has an integrated PLL with a dedicated feedback pin (FBIN) for synchronization and zero-delay. FBIN must be directly routed to a clock output to complete the feedback loop. When no input is applied to the CLKIN pin, the device powers down the outputs by setting them to a low logic level.

Because it is based on a PLL circuitry, the CDCVF25081 requires a stabilization time to achieve phase lock of the feedback signal to the reference signal. This time is required following power up and application of a fixed-frequency signal at CLKIN and any changes to the PLL reference.

Output duty cycles are adjusted to 50%, independent of duty cycle at CLKIN. Each output has an internal series damping resistor of 25 ohms useful in driving point-to-point loads. Unused outputs can be left floating to reduce overall system cost.

表 8-1 lists the output bank mapping of the CDCVF25081.

表 8-1. Output Bank Mapping

BANK	CLOCK OUTPUTS
0	1Y0, 1Y1, 1Y2, 1Y3
1	2Y0, 2Y1, 2Y2, 2Y3

8.4 Device Functional Modes

The CDCVF25081 operates from a 3.3-V supply. 表 8-2 shows the output logic states of the device based on the selection pins. Based on the input selection pins (S1 and S2), the two output banks can be set as PLL outputs, bypassed PLL outputs, or high impedance.

表 8-2. Output Logic Table

S2	S1	Bank 1	Bank 2	OUTPUT SOURCE	PLL SHUTDOWN
0	0	Hi-Z	Hi-Z	N/A	Yes
0	1	Active	Hi-Z	PLL(1)	No
1	0	Active	Active	Input clock (PLL bypass)	Yes
1	1	Active	Active	PLL(1)	No

(1) If CLKIN < 2 MHz, then the outputs are switched to a LOW level.

9 Application and Implementation

备注

Information in the following applications sections is not part of the TI component specification, and TI does not warrant its accuracy or completeness. TI's customers are responsible for determining suitability of components for their purposes, as well as validating and testing their design implementation to confirm system functionality.

9.1 Application Information

The CDCVF25081 is a low additive jitter, phase-locked loop driver that can operate up to 200 MHz with a 3.3-V supply. The PLL circuitry is internal to device requiring no additional configuration by the user.

9.2 Typical Application

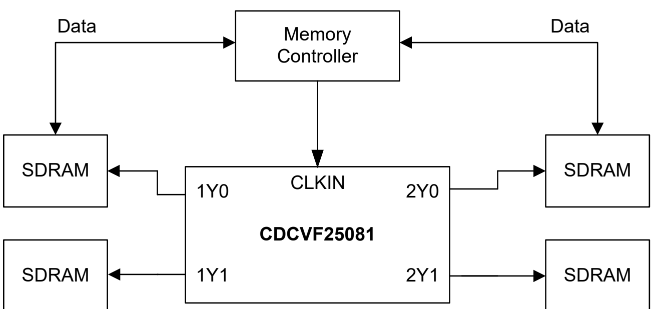

图 9-1. System Configuration Example

9.2.1 Design Requirements

Any output pin can be used to synchronize the FBIN to the outputs. TI recommends to not have a load on the output routed to the FBIN pin for optimum results.

9.2.2 Detailed Design Procedure

Unused outputs can be left floating. See the *Power Supply Recommendations* section for recommended filtering techniques.

9.2.3 Application Curves

10 Power Supply Recommendations

High-performance clock buffers can be sensitive to noise on the power supply, which may dramatically increase the additive jitter of the buffer. Thus, it is essential to manage any excessive noise from the system power supply, especially for applications where the jitter and phase noise performance is critical.

Filter capacitors are used to eliminate the low-frequency noise from the power supply, where the bypass capacitors provide the very low impedance path for high-frequency noise and guard the power supply system against induced fluctuations. These bypass capacitors also provide instantaneous current surges as required by the device and should have low equivalent series resistance (ESR). To properly bypass the supply, the decoupling capacitors must be placed very close to the power-supply terminals, be connected directly to the ground plane, and laid out with short loops to minimize inductance. TI recommends adding as many high-frequency (for example, 0.1 µF) bypass capacitors, as there are supply terminals in the package. TI recommends, but does not require, inserting a ferrite bead between the board power supply and the chip power supply that isolates the high-frequency switching noises generated by the clock buffer. These beads prevent the switching noise from leaking into the board supply. It is imperative to choose an appropriate ferrite bead with very low DC resistance to provide adequate isolation between the board supply and the chip supply, as well as to maintain a voltage at the supply terminals that is greater than the minimum voltage required for proper operation.

图 10-1 shows the recommended power supply decoupling method.

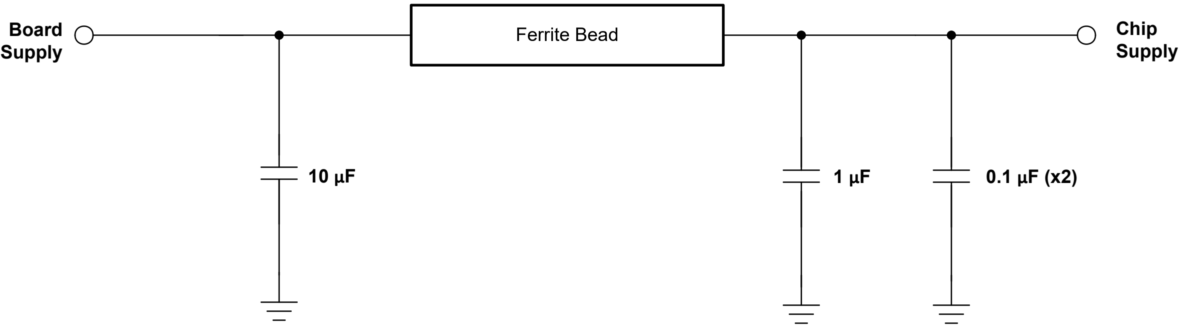

图 10-1. Power Supply Decoupling

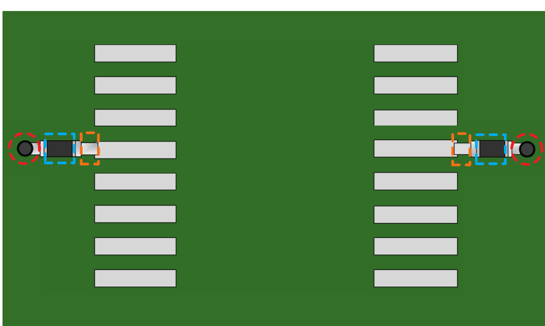
11 Layout

11.1 Layout Guidelines

图 11-1 shows a conceptual layout detailing recommended placement of power-supply bypass capacitors. For component side mounting, use 0402 body size capacitors to facilitate signal routing. Keep the connections between the bypass capacitors and the power supply on the device as short as possible. Ground the other side of the capacitor using a low-impedance connection to the ground plane.

11.2 Layout Example



Ground bypass capacitor with low impedance connection to ground plane

0402 or smaller body size capacitors are recommended

Place bypass power supply capacitors as short as possible to device pin

12.5 Electrostatic Discharge Caution

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

(1) The marketing status values are defined as follows:
ACTIVE: Product device recommended for new designs.
LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.
NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.
PREVIEW: Device has been announced but is not in production. Samples may or may not be available.
OBSOLETE: TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".
RoHS Exempt: TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.
Green: TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.
