1.3 简介

TUSB8040A 是一款四端口 USB 3.0 兼容集线器，它采用 100 引脚四方扁平无引线 (QFN) 封装。 此器件被设计用于 0°C 至 70°C 商用温度下的运行。

TUSB8040A 在上行端口上提供同时超快速 USB 和高速或全速连接，而在下行端口上提供超快速 USB，高速，全速，或者低速连接。 当上行端口被连接到一个只支持高速、全速或低速连接的电气环境中时，下行端口上的超快速 USB 连通被禁用。 当上行端口被连接到一个只支持全速或低速连接的电气环境中时，下行端口上的超快速 USB 和高速连通被禁用。

TUSB8040A 支持多达四个下行端口。 它可被配置为通过引脚选择或者一个连接的 EEPROM 或者 SMBus 控制器来报告一至四个下行端口。 这个配置选项提供了通过应用来缩放器件的功能。

1.4 功能说明

TUSB8040A 支持每端口或者成组电源开关和过流保护。

按照 USB 主机的要求，一个端口电源单独控制集线器开关为每个下行端口加电或者断电。 同样地，当一个端口电源单独控制集线器感测到一个过流事件时，它只关闭到受影响的下行端口的电源。

当需要为任一端口供电时，一个成组集线器开关打开到其所有下行端口的电源。 只有当所有端口处于电源可被移除的状态时，到下行端口的电源才可被关闭。 同样地，当一个成组集线器感测到一个过流事件时，到所有下行端口的电源将被关闭。

TUSB8040A 还使用一个 I^2C EEPROM 或者通过一个 SMBus 主机针对供货商特定 PID，VID，和字串进行配置来提供器件定制。 对于 TUSB8040A，通过使用引脚选择，I^2C EEPROM 或者一个 SMBus 主机可将端口标记为被禁用或者永远连接。 F8h 上的器件状态信息和命令寄存器不能由 I^2C EEPROM 中的内容修改。

2.2 Clock and Reset Signals

Table 2-2. Clock and Reset Signals

SIGNAL NAME	TYPE	PIN NO.	DESCRIPTION
GRSTz	I, PU	A18	Global power reset. This reset brings all of the TUSB8040A internal registers to their default states. When GRSTz is asserted, the device is completely nonfunctional. GRSTz should be asserted a minimum of 3 ms after all power rails are valid at the device.
XI	I	A49	Crystal input. This terminal is the crystal input for the internal oscillator. The input may alternately be driven by the output of an external oscillator. When using a crystal a 1-MΩ feedback resistor is required between XI and XO.
XO	O	A48	Crystal output. This terminal is crystal output for the internal oscillator. If XI is driven by an external oscillator this pin may be left unconnected. When using a crystal a 1-MΩ feedback resistor is required between XI and XO.
VSSOSC	I	B45	Oscillator return. If using a crystal, the load capacitors should use this signal as the return path and it should not be connected to the PCB ground. If using an oscillator, this terminal should be connected to PCB Ground.

USB_R1RTN	PT	B47	Precision resistor reference return
USB_VBUS	I	B44	USB Upstream port power monitor. The USB_VBUS input is a 1.2-V I/O cell and requires a voltage divider to prevent damage to the input. The signal USB_VBUS must be connected to VBUS through a 90.9-kΩ ±1% resistor, and to signal ground through a 10-kΩ ±1% resistor. This allows the input to detect VBUS present from a minimum of 4 V and sustain a maximum VBUS voltage up to 10 V (applied to the voltage divider).

2.5 I²C/SMBUS Signals

Table 2-5. I²C/SMBUS Signals

SIGNAL NAME	TYPE	PIN NO.	DESCRIPTION
SCL/SMBCLK	I/O, PD	B17	I²C clock/SMBus clock. Function of terminal depends on the setting of the SMBUSz input. When SMBUSz = 1, this terminal acts as the serial clock interface for an I²C EEPROM. When SMBUSz = 0, this terminal acts as the serial clock interface for an SMBus host. The SCL_SMBCLK terminal is sampled at the deassertion of reset to determine if SuperSpeed USB low power states U1 and U2 are initiated. If SCL_SMBCLK is low, (default), U1 / U2 power states are enabled. If SCL_SMBCLK is high, entry to U1 / U2 power states is not initiated by the hub downstream ports, but is accepted. This input is over-ridden if SDA_SMBDAT is sampled as a '1'. If an EEPROM is installed, U1/U2 power state support is controlled by the Device Configuration Register. Can be left unconnected if external interface not implemented.
SDA/SMBDAT	I/O, PD	A19	I²C data/SMBus data. Function of terminal depends on the setting of the SMBUSz input. When SMBUSz = 1, this terminal acts as the serial data interface for an I²C EEPROM. When SMBUSz = 0, this terminal acts as the serial data interface for an SMBus host. The SDA_SMBDAT terminal is sampled at the deassertion of reset to determine if SuperSpeed USB low power states U1 and U2 are disabled. If SDA_SMBDAT is high, U1 and U2 low power states are disabled. If SDA_SMBDAT is low, U1 and U2 low power states are enabled. If the optional EEPROM or SMBUS is implemented, the value of the u1u2Disable bit of the Device Configuration Register determines if the low power states U1 and U2 are enabled. Can be left unconnected if external interface not implemented and U1 and U2 are to be enabled.
SMBUSz	I, PU	B18	I²C/SMBus mode select. 1 = I²C Mode Selected 0 = SMBus Mode Selected Can be left unconnected if external interface not implemented.

FULLPWRMGMTz_SMBA1	I, PU	A17	Full power management enable/SMBus address bit 1. The value of the terminal is sampled at the de-assertion of reset to set the power switch control follows: 0 = Full power management supported 1 = Full Power management not supported Full power management is the ability to control power to the downstream ports of the TUSB8040 using the PWRON0z_BATEN0 terminal. When SMBus mode is enabled using SMBUSz, this terminal sets the value of the SMBus slave address bit 1. SMBus slave address bits 2 and 3 are always 1 for the TUSB8040. When SMBus mode is enabled using SMBUSz, this terminal sets the value of the SMBus slave address bit 1. Can be left unconnected if full power management and SMBus are not implemented.

3.2 I_2C EEPROM Operation

The TUSB8040A supports a single-master, standard mode (100 kbit/s) connection to a dedicated I^2C EEPROM when the I^2C interface mode is enabled. In I^2C mode, the TUSB8040A reads the contents of the EEPROM at bus address 1010000b using 7-bit addressing starting at address 0. If the value of the EEPROM contents at byte 00h equals 55h, the TUSB8040A loads the configuration registers according to the EEPROM map. If the first byte is not 55h, the TUSB8040A exits the I^2C mode and continues execution with the default values in the configuration registers. The hub will not connect on the upstream port until the configuration is completed.

Note, the bytes located below offset 9h are optional. The requirement for data in those addresses is dependent on the options configured in the Device Configuration and Phy Custom Configuration registers.

For details on I^2C operation refer to the UM10204 I^2C-bus Specification and User Manual.

3.3 SMBus Slave Operation

When the SMBus interface mode is enabled, the TUSB8040A supports read block and write block protocols as a slave-only SMBus device.

The TUSB8040ARKM slave address is 1000 pgxy, where:

- p is the state of PORTINDz_SMBA3 at reset,
- g is the state of GANGED_SMBA2 at reset,
- x is the state of FULLPWRMGMTz_SMBA1 at reset, and
- y indicates read (logic 1) or write (logic 0) access.

If the TUSB8040A is addressed by a host using an unsupported protocol it will not respond. The TUSB8040A will wait indefinitely for configuration by the SMBus host and will not connect on the upstream port until the SMBus host indicates configuration is complete by clearing the CFG_ACTIVE bit.

For details on SMBus requirements refer to the System Management Bus Specification.

3.4 Configuration Registers

The internal configuration registers are accessed on byte boundaries. The configuration register values are loaded with defaults but can be over-written when the TUSB8040A is in I^2C or SMBus mode.

Table 3-13. Bit Descriptions – Device Configuration Register

Bit	Field Name	Access	Description
6	customSernum	RW	Custom Serial Number Enable. When the TUSB8040A is in I^2C mode, the TUSB8040A loads the serial number register from the contents of the EEPROM. When the TUSB8040A is in SMBUS mode, the Serial Number registers may written by an SMBus host. This bit defaults to 0.
5	u1u2Disable	RW	U1 U2 Disable. When this bit is set the TUSB8040A will not initiate or accept any U1 or U2 requests on any port, upstream or downstream, unless it receives or sends a Force_LinkPM_Accept LMP. After receiving or sending an FLPMA LMP, it will continue to enable U1 and U2 according to USB 3.0 protocol until it gets a power-on reset or is disconnected on its upstream port. This bit is loaded at the de-assertion of reset with the value of the SDA_SMBDAT terminal. When the TUSB8040A is in I^2C mode, the TUSB8040A loads this bit from the contents of the EEPROM. When the TUSB8040A is in SMBUS mode, the value may be over-written by an SMBus host.
4	portIndz	RW	Port Indicator Status. This bit shall be loaded at the de-assertion of reset with the value of PORTINDz_SMBA3 terminal. When the TUSB8040A is in I^2C mode, the TUSB8040A loads this bit from the contents of the EEPROM. When the TUSB8040A is in SMBUS mode, the value may be overwritten by an SMBus host.
3	ganged	RW	Ganged. This bit shall be loaded at the de-assertion of reset with the value of GANGEd_SMBA2 terminal. When the TUSB8040A is in I^2C mode, the TUSB8040A loads this bit from the contents of the EEPROM. When the TUSB8040A is in SMBUS mode, the value may be overwritten by an SMBus host.
2	fullPwrMgmtz	RW	Full Power Management. This bit is loaded at the de-assertion of reset with the value of the FULLPWRMGMTz_SMBA1 terminal. When this bit is 0, power switching and over-current detection is supported whether bus- or self-powered. When the bit is 1 and the device is bus powered, power switching is supported but over-current detection is not supported. When the bit is 1 and the device is self-powered over-current detection is supported but power switching is not supported. 1	smbusRst	RSU	SMBus interface reset. This bit resets the SMBus slave interface to its default state and loads the registers back to their GRSTz values. This bit is set by writing a 1 and is cleared by hardware on completion of the reset. A write of 0 has no effect. (Not used with I^2C)
0	cfgActive	RCU	Configuration active. This bit indicates that configuration of the TUSB8040A is currently active. The bit is set by hardware when the device enters the I^2C or SMBus mode. The TUSB8040A does not connect on the upstream port while this bit is 1.When in I^2C mode, the bit is cleared by hardware when the TUSB8040A exits the I^2C mode. When in the SMBus mode, this bit must be cleared by the SMBus host in order to exit the configuration mode and allow the upstream port to connect. The bit is cleared by a writing 1. A write of 0 has no effect.

4 CLOCK GENERATION

The TUSB8040A accepts a crystal input to drive an internal oscillator or an external clock source. If a clock is provided to XI instead of a crystal, XO is left open and VSSOSC should be connected to the PCB ground plane. Otherwise, if a crystal is used, the connection needs to follow the guidelines below. Since XI and XO are coupled to other leads and supplies on the PCB, it is important to keep them as short as possible and away from any switching leads. It is also recommended to minimize the capacitance between XI and XO. This can be accomplished by connecting the VSSOSC lead to the two external capacitors CL1 and CL2 and shielding them with the clean ground lines. The VSSOSC should not be connected to PCB ground when using a crystal.

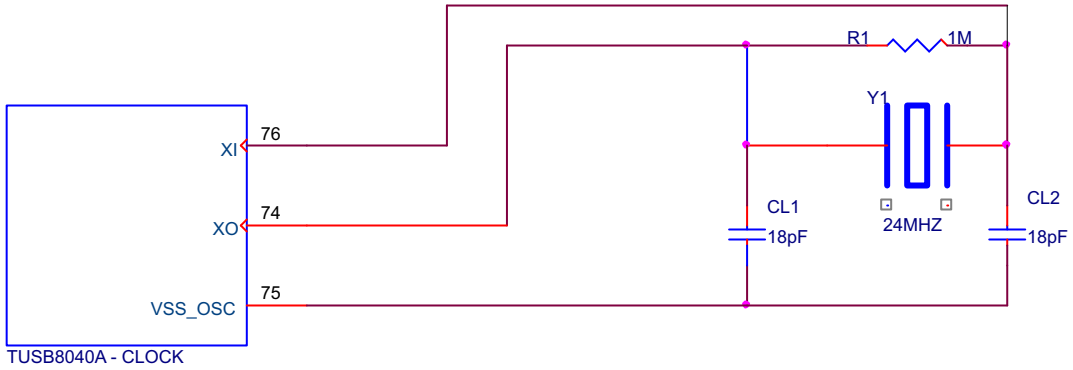

Figure 4-1. TUSB8040A Clock

4.1 Crystal Requirements

The crystal must be fundamental mode with load capacitance of 12 pF to 24 pF and frequency stability rating of ±100 PPM or better. To ensure proper startup oscillation condition, a maximum crystal equivalent series resistance (ESR) of 50 Ω is recommended. A parallel, 18-pF load capacitor should be used if a crystal source is used. VSSOSC should not be connected to the PCB ground plane.

4.2 Input Clock Requirements

When using an external clock source such as an oscillator, the reference clock should have a ±100 PPM or better frequency stability and have less than 50-ps absolute peak to peak jitter or less than 25-ps peak to peak jitter after applying the USB 3.0 jitter transfer function. XI should be tied to the 1.8-V clock source and XO should be left floating. VSSOSC should be connected to the PCB ground plane.

5 POWER UP AND RESET

The TUSB8040A does not have specific power sequencing requirements with respect to the core power (VDD11) or I/O and analog power (VDD33). The core power (VDD11) or I/O power (VDD33) may be powered up for an indefinite period of time while the other is not powered up if all of these constraints are met:

- All maximum ratings and recommended operating conditions are observed.
- All warnings about exposure to maximum rated and recommended conditions are observed, particularly junction temperature. These apply to power transitions as well as normal operation.
- Bus contention while VDD33 is powered up must be limited to 100 hours over the projected life-time of the device.
- Bus contention while VDD33 is powered down may violate the absolute maximum ratings.

A supply bus is powered up when the voltage is within the recommended operating range. It is powered down when it is below that range, either stable or in transition.

A minimum reset duration of 3 ms is required. This is defined as the time when the power supplies are in the recommended operating range to the de-assertion of GRSTz. This can be generated using programmable-delay supervisory device or using an RC circuit.

THERMAL INFORMATION

This package incorporates an exposed thermal pad that is designed to be attached directly to an external heatsink. The thermal pad must be soldered directly to the printed circuit board (PCB). After soldering, the PCB can be used as a heatsink. In addition, through the use of thermal vias, the thermal pad can be attached directly to the appropriate copper plane shown in the electrical schematic for the device, or alternatively, can be attached to a special heatsink structure designed into the PCB. This design optimizes the heat transfer from the integrated circuit (IC).

For information on the Quad Flatpack No–Lead (QFN) package and its advantages, refer to Application Report, QFN/SON PCB Attachment, Texas Instruments Literature No. SLUA271. This document is available at www.ti.com.
