## DESCRIPTION

The quadruple buffer is designed for 1.65V to 5.5V V<sub>CC</sub> operation. The RS4G126 device is quadruple line drivers with 3-state outputs. The outputs are disabled when the output-enable input is low.

This device is fully specified for partial-power-down applications using I<sub>off</sub>. The I<sub>off</sub> circuitry disables the outputs, preventing damaging current backflow through the device when it is powered down.

To ensure the high-impedance state during power up or power down, OE should be tied to GND through a pull-down resistor, the minimum value of the resistor is determined by the current-sourcing capability of the driver.

The RS4G126 is available in Green SOIC-14(SOP14) and TSSOP-14 packages. It operates over an ambient temperature range of -40°C to +125°C.
