

# Supply Voltage Supervisor with Watchdog and Manual Reset

## 1 FEATURES

- **Operating Voltage Range: 1.0V to 5.5V**
- **Low Power Consumption: 40µA (Max)**
- **Precision Supply-Voltage Monitor:**  
2.63V, 2.93V, 3.08V, 4.00V
- **Debounced TTL/CMOS Compatible Manual-Reset Input**
- **Guaranteed  $\overline{\text{RESET}}$  Valid at  $V_{CC}=1.0V$**
- **160ms Reset Pulse Width**
- **Independent Watchdog Timer (1.6sec TYP) Timeout**
- **Voltage Monitor for Power-Fail or Low-Battery Warning**
- **Operating Temperature Range:**  
-40°C to +125°C
- **Available in Green Package: SOIC-8(SOP8)**

## 2 APPLICATIONS

- Computers
- SOC、DSP or Micro Controllers
- Embedded Systems
- Industrial Equipment
- Intelligent Instruments
- Critical µP Power Monitoring
- Wireless Communications Systems

## 3 DESCRIPTIONS

The RS706 microprocessor (µP) supervisory circuits reduce the complexity and number of components required to monitor power-supply and battery function in µP systems. This device significantly improves system reliability and accuracy compared to separate ICs or discrete components.

The RS706 provide four functions:

- 1) A reset output during power-up, power-down, and brownout conditions. The reset output remains operational with  $V_{CC}$  as low as 1.0V.
- 2) An independent watchdog output that goes low if the watchdog input has not been toggled within 1.6 seconds (TYP).
- 3) A 1.2V threshold detector for power-fail warning, low-battery detection, or for monitoring a power supply.
- 4) An active-low manual-reset input.

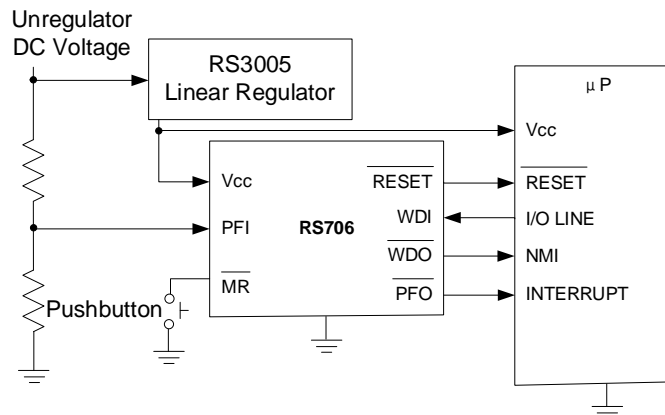

The RS706 is available in Green SOIC-8 (SOP8) package. It operates over an ambient temperature range of -40°C to +125°C.

Device Information (1)

PART NUMBER	PACKAGE	BODY SIZE (NOM)
RS706	SOIC-8(SOP8)	4.90mm x 3.90mm

(1) For all available packages, see the orderable addendum at the end of the data sheet.

- (3) B, C, D, E, represents different Reset Thresholds.

## 7 PIN CONFIGURATIONS

### PIN DESCRIPTION

PIN	NAME	FUNCTION
SOIC-8(SOP8)		
1	$\overline{\text{MR}}$	Manual-Reset Input triggers a reset pulse when pulled below 0.8V. This active-low input has an internal pull-up resistance. It can be driven from a TTL or CMOS logic line as well as shorted to ground with a switch.
2	V <sub>CC</sub>	Power Supply Voltage that is monitored.
3	GND	Ground, reference for all signals.
4	PFI	Power-Fail Volta Monitor Input. When PFI is less than 1.2V, $\overline{\text{PFO}}$ goes low. Connect PFI to GND or V <sub>CC</sub> if not used.
5	$\overline{\text{PFO}}$	Power-Fail Output goes low and sinks current when PFI is less than 1.2V; Otherwise $\overline{\text{PFO}}$ stays high.
6	WDI	Watchdog Input. If WDI remains high or low 1.6sec, the internal watchdog timer runs out and WDO goes low. Floating WDI or connecting WDI to a high-impedance three-state buffer disables the watchdog feature. The internal watchdog timer clears whenever reset is asserted, WDI is three-stated, or WDI sees a rising or falling edge.
7	$\overline{\text{RESET}}$	Active-Low Reset Output pulses low for 160ms when triggered, and stays low whenever V <sub>CC</sub> is below the reset threshold. It remains low for 160ms after V <sub>CC</sub> rises above the reset threshold or $\overline{\text{MR}}$ goes from low to high. A watchdog timeout will not trigger $\overline{\text{RESET}}$ unless $\overline{\text{WDO}}$ is connected to $\overline{\text{MR}}$ .
8	$\overline{\text{WDO}}$	Watchdog Output pulls low when the internal watchdog timer finishes, its 1.6sec count and does not go high again until the watchdog is cleared. $\overline{\text{WDO}}$ also goes low during low-line conditions. Whenever V <sub>CC</sub> is below the reset threshold, $\overline{\text{WDO}}$ stays low; $\overline{\text{WDO}}$ does not have a minimum pulse width. As soon as V <sub>CC</sub> rises above the reset threshold, $\overline{\text{WDO}}$ goes high with no delay.

## 8 Specifications

### 8.1 Absolute Maximum Ratings <sup>(1)</sup>

over operating free-air temperature range (unless otherwise noted) <sup>(1)(2)</sup>

		MIN	MAX	UNIT
V <sub>CC</sub>	Supply voltage range	-0.5	6.0	V
V <sub>I</sub>	Input voltage range <sup>(2)</sup>	-0.5	6.0	V
V <sub>O</sub>	Voltage range applied to any output in the high-impedance or power-off state <sup>(2)</sup>	-0.5	6.0	V
V <sub>O</sub>	Voltage range applied to any output in the high or low state <sup>(2)(3)</sup>	-0.5	V <sub>CC</sub> +0.5	V
I <sub>IK</sub>	Input clamp current	V <sub>I</sub> <0	-20	mA
I <sub>OK</sub>	Output clamp current	V <sub>O</sub> <0	-20	mA
I <sub>O</sub>	Continuous output current		±20	mA
	Continuous current through V <sub>CC</sub> or GND		±20	mA
T <sub>J</sub>	Junction temperature <sup>(4)</sup>	-65	150	°C
T <sub>stg</sub>	Storage temperature	-65	150	°C
T <sub>A</sub>	Operating temperature	-40	125	°C

- (1) Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under *Recommended Operating Conditions* is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
- (2) The input and output negative-voltage ratings may be exceeded if the input and output current ratings are observed.
- (3) The value of V<sub>CC</sub> is provided in the *Recommended Operating Conditions table*.
- (4) The maximum power dissipation is a function of T<sub>J(MAX)</sub>, R<sub>θJA</sub>, and T<sub>A</sub>. The maximum allowable power dissipation at any ambient temperature is P<sub>D</sub> = (T<sub>J(MAX)</sub> - T<sub>A</sub>) / R<sub>θJA</sub>. All numbers apply for packages soldered directly onto a PCB.

### 8.2 ESD Ratings

The following ESD information is provided for handling of ESD-sensitive devices in an ESD protected area only.

		VALUE	UNIT
V <sub>(ESD)</sub>	Electrostatic discharge	Human-body model (HBM), per ANSI/ESDA/JEDEC JS-001 <sup>(1)</sup>	±6000 V
		Machine model (MM)	±300 V

- (1) JEDEC document JEP155 states that 500 V HBM allows safe manufacturing with a standard ESD control process.

#### ESD SENSITIVITY CAUTION

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

### 8.3 Thermal Information:

THERMAL METRIC <sup>(1)</sup>		RS706	UNIT
		8PINS	
		SOIC-8(SOP8)	
R <sub>θJA</sub>	Junction-to-ambient thermal resistance	124.7	°C/W
R <sub>θJC(top)</sub>	Junction-to-case(top) thermal resistance	66.9	°C/W
R <sub>θJB</sub>	Junction-to-board thermal resistance	67.9	°C/W
Ψ <sub>JT</sub>	Junction-to-top characterization parameter	19.2	°C/W
Ψ <sub>JB</sub>	Junction-to-board characterization parameter	67.2	°C/W
R <sub>θJC(bot)</sub>	Junction-to-case(bottom) thermal resistance	N/A	°C/W

- (1) Thermal resistance varies with operating conditions.

## 8.4 ELECTRICAL CHARACTERISTICS

( $V_{CC} = 1.67V$  to  $5.5V$  for RS706-1.63;  $V_{CC} = 2.7V$  to  $5.5V$  for RS706-2.63;  $V_{CC} = 3V$  to  $5.5V$  for RS706-2.93;  $V_{CC} = 3.16V$  to  $5.5V$  for RS706-3.08;  $V_{CC} = 4.1V$  to  $5.5V$  for RS706-4.00;  $V_{CC} = 4.51V$  to  $5.5V$  for RS706-4.40;  $V_{CC} = 4.77V$  to  $5.5V$  for RS706-4.65;  $T_A = -40^{\circ}C$  to  $+125^{\circ}C$ , unless otherwise noted, typical at  $25^{\circ}C$ .) <sup>(1)</sup>

- 4.00V for RS706-E

## 10 Detailed Description

### 10.1 Reset Output

A microprocessor's ( $\mu\text{P}$ 's) reset input starts the  $\mu\text{P}$  in a known state. Whenever the  $\mu\text{P}$  is in an unknown state, it should be held in reset. The RS706 asserts reset during power-up and prevents code execution errors during power-down or brownout conditions.

On power-up, once  $V_{\text{CC}}$  reaches 1.0V,  $\overline{\text{RESET}}$  is a guaranteed logic low of 0.4V or less. As  $V_{\text{CC}}$  rises,  $\overline{\text{RESET}}$  stays low. When  $V_{\text{CC}}$  rises above the reset threshold, an internal timer releases  $\overline{\text{RESET}}$  after about 160ms.  $\overline{\text{RESET}}$  pulses low whenever  $V_{\text{CC}}$  dips below the reset threshold. If brownout occurs in the middle of a previously initiated reset pulse, the pulse continues for at least another 100ms. On power-down, once  $V_{\text{CC}}$  falls below the reset threshold,  $\overline{\text{RESET}}$  stays low and is guaranteed to be 0.4V or less until  $V_{\text{CC}}$  drops below 1.0V.

### 10.2 Watchdog Timer

The RS706 watchdog circuit monitors the  $\mu\text{P}$ 's activity. If the  $\mu\text{P}$  does not toggle the watchdog input (WDI) within 1.6 sec (Minimum is 1.0 sec) and WDI is not three times stated,  $\overline{\text{WDO}}$  goes low. As long as  $\overline{\text{RESET}}$  is asserted or the WDI input is three times stated, the watchdog timer stays cleared and will not count. As soon as reset is released and WDI is driven high or low, the timer starts counting. Pulses as short as 50ns can be detected.

Typically,  $\overline{\text{WDO}}$  is not connected to the non-maskable interrupt input (NMI) of a  $\mu\text{P}$ . When  $V_{\text{CC}}$  drops below the reset threshold,  $\overline{\text{WDO}}$  goes low whether or not the watchdog timer has timed out yet. Normally this would trigger an NMI interrupt, but  $\overline{\text{RESET}}$  goes low simultaneously, and thus overrides the NMI interrupt.

If WDI is left unconnected,  $\overline{\text{WDO}}$  can be used as a low-line output. Since floating WDI disables the internal timer,  $\overline{\text{WDO}}$  goes low only when  $V_{\text{CC}}$  falls below the reset threshold, thus functioning as a low-line output.

### 10.3 Manual Reset

The manual-reset input ( $\overline{\text{MR}}$ ) allows reset to be triggered by a push-button switch.  $\overline{\text{MR}}$  is TTL/CMOS logic compatible, so it can be driven by an external logic line.  $\overline{\text{MR}}$  can be used to force a watchdog timeout to generate a reset pulse in the RS706. Simply connect  $\overline{\text{WDO}}$  to  $\overline{\text{MR}}$ .

### 10.4 Power-Fail Comparator

The power-fail comparator can be used for various purposes because its output and non-inverting input are not internally connected. The inverting input is internally connected to a 1.2V reference.

To build an early-warning circuit for power failure, connect the PFI pin to a voltage divider. Choose the voltage divider ratio so that the voltage at PFI falls below 1.2V just before the 5V regulator drops out. Use  $\overline{\text{PFO}}$  to interrupt the  $\mu\text{P}$  so it can prepare for an orderly power-down.

## 11 Applications Information

### 11.1 Ensuring a Valid RESET Output Down to $V_{CC}=0V$

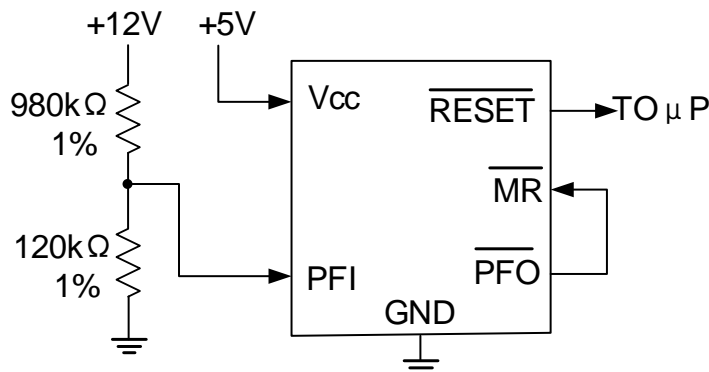

When  $V_{CC}$  falls down below 1V, the RS706  $\overline{RESET}$  output no longer sinks current, it becomes an open circuit. High-impedance CMOS logic inputs can drift to undetermined voltages if left un-driven. If a pull-down resistor is added to the  $\overline{RESET}$  pin, as shown in Figure 17, any stray charge or leakage currents will be drained to ground, holding  $\overline{RESET}$  low. Resistor value (R1) is not critical. It should be about 100K $\Omega$ , large enough not to load  $\overline{RESET}$  and small enough to pull  $\overline{RESET}$  to ground.

**Figure 17. RESET Valid to Ground Circuit**

### 11.2 Monitoring Voltages Other Than the Unregulated DC Input

Monitor voltages other than the unregulated DC by connecting a voltage-divider to PFI and adjusting the ratio appropriately. If required, add hysteresis by connecting a resistor (with a value approximately 10 times the sum of the two resistors in the potential divider network) between PFI and  $\overline{PFO}$ . A capacitor between PFI and GND reduces the power - fail circuit's sensitivity to high-frequency noise on the line being monitored.  $\overline{RESET}$  can be asserted on other voltages in addition to the 5V  $V_{CC}$  line. Connect  $\overline{PFO}$  to  $\overline{MR}$  to initiate a  $\overline{RESET}$  pulse when PFI drops below 1.2V. Figure 18 shows the RS706 configured to assert  $\overline{RESET}$  when the 5V supply falls below the reset threshold, or when the 12V supply falls below approximately 11V.

**Figure 18. Monitoring Both 5V and 12V**

### 11.3 Interfacing to $\mu P$ s with Bidirectional Reset Pins

$\mu P$ s with bidirectional reset pins, can contend with the RS706  $\overline{RESET}$  output. If, for example, the  $\overline{RESET}$  output is driven high and the  $\mu P$  wants to pull it low, indeterminate logic levels may result. To correct this, connect a 4.7K $\Omega$  resistor between the  $\overline{RESET}$  output and the  $\mu P$  reset I/O, as in Figure 19. Buffer the  $\overline{RESET}$  output to other system components.

Figure 19. Buffered  $\overline{\text{RESET}}$  to other system components
