General Description

The SN74LVC2G14 is a high performance dual inverter with Schm itt−Trigge r inputs operating from a 1.65 to 5.5 V supply. Pin configuration and function are the same as the SN74LVC2G04, but the inputs ha ve hysteresis and, with its Schmitt trigger function, the SN74LVC2G14 can be used as a line receiver which will receive slow input signals.

The SN74LVC2G14 is capable of transforming slowly changing input signals into sharply defined, jitter−freeoutput signals. In addition, it has a greater noise margin than conventional inverters.

The SN74LVC2G14 has hysteresis between the positive−going and the negativ e−going input thresholds (typically 1V) which is determined internally by transistor radios and is essentially insensitive to temperature and supply voltage variations.

Features

- Designed for 1.65V to 5.5V V_{CC} Operation
- Over Voltage Tolerant Inputs and Outputs
- LVTTL Compatible − Interface Capability with 5V TTL Logic with V_{CC} = 3V
- LVCMOS Compatible
- 24 mA Balanced Output Sink and Source Capability
- Near Zero Static Supply Current Substantially Reduces System Power Requirements
- CurrentDrive Capability is 24 mA at the Outputs
- Chip Complexity: FET = 72
- These Devices are Pb−Free and are RoHS Compliant

6. C_{PD} is defined as the value of the internal equivalent capacitance which is calculated from the operating current consumption without load. Average operating current can be obtained by the equation:$I_{CC(OPR)}$=C_{PD}*V_{CC}*fin+I_{CC}*C_{PD} is used to determine the no−load dynamic power consumption; P_D=C_{PD}*V_{CC}^2*fin+I_{CC}*V_{CC}*Fig.
