256K x 36, 512K x 18
3.3V Synchronous ZBT™ SRAMs
ZBT™ Feature
3.3V I/O, Burst Counter
Pipelined Outputs

AS8C803601
AS8C801801

Features

- **256K x 36, 512K x 18 memory configurations**
- **Supports high performance system speed - 150MHz (3.8ns Clock-to-Data Access)**
- **ZBT™ Feature - No dead cycles between write and read cycles**
- **Internally synchronized output buffer enable eliminates the need to control $\overline{OE}$**
- **Single R/$\overline{W}$ (READ/WRITE) control pin**
- **Positive clock-edge triggered address, data, and control signal registers for fully pipelined applications**
- **4-word burst capability (interleaved or linear)**
- **Individual byte write ($\overline{BW}_1$ - $\overline{BW}_4$) control (May tie active)**
- **Three chip enables for simple depth expansion**
- **3.3V power supply (±5%)**
- **3.3V I/O Supply (V_{DDQ})**
- **Power down controlled by ZZ input**
- **Packaged in a JEDEC standard 100-pin plastic thin quad flatpack (TQFP).**

Description

The AS8C803601/801801 are3.3V high-speed 9,437,184 bit (9 Megabit) synchronous SRAMS. They are designed to eliminate dead bus cycles when turning the bus around between reads and writes, or writes and reads. Thus, they have been given the name ZBT™, or Zero Bus Turnaround.

Address and control signals are applied to the SRAM during one clock cycle, and two cycles later the associated data cycle occurs, be it read or write.

The AS8C803601/801801 contain data I/O, address and control signal registers. Output enable is the only asynchronous signal and can be used to disable the outputsat any given time.

A Clock Enable($\overline{CEN}$) pin allows operation of the toAS8C803601/ 801801 be suspended as long as necessary. All synchronous inputs are ignored when ($\overline{CEN}$)is high and the internal device registers will hold their previous values.

There are three chip enable pins ($\overline{CE}1$, CE2,$\overline{CE}2$) that allow the user to deselect the device when desired. If anyone of these three are not asserted when ADV/$\overline{LD}$ is low, no new memoryoperation can be initiated. However, any pending data transfers (reads or writes) will be completed. The data bus will tri-state two cycles after chip is deselected or a write is initiated.

TheAS8C803601/801801 have an on-chip burst counter. In the burst mode,the AS8C803601/801801 can provide fourcycles of data for a single address presented to the SRAM. The order of the burst sequence is defined by the $\overline{LBO}$ input pin. The $\overline{LBO}$ pin selects between linear and interleaved burst sequence. The ADV/$\overline{LD}$ signal is used to load a new external address (ADV/$\overline{LD}$ = LOW) or increment the internal burst counter (ADV/$\overline{LD}$ = HIGH).

The AS8C803601/801801 SRAM utilize IDT's latest high-performance CMOS process, andare packaged ina JEDEC Standard 14mm x 20mm 100-pin thin plastic quad flatpack (TQFP) aswell as a 119ball grid array (BGA)and 165 fine pitch ball grid array (fBGA)

Pin Description Summary

A_0-A_{18}	Address Inputs	Input	Synchronous
$\overline{CE}_1$, CE_2, $\overline{CE}_2$	Chip Enables	Input	Synchronous
$\overline{OE}$	Output Enable	Input	Asynchronous
R/$\overline{W}$	Read/Write Signal	Input	Synchronous
$\overline{CEN}$	Clock Enable	Input	Synchronous
$\overline{BW}_1$, $\overline{BW}_2$, $\overline{BW}_3$, $\overline{BW}_4$	Individual Byte Write Selects	Input	Synchronous
CLK	Clock	Input	N/A
ADV/$\overline{LD}$	Advance burst address / Load new address	Input	Synchronous
$\overline{LBO}$	Linear / Interleaved Burst Order	Input	Static
ZZ	Sleep Mode	Input	Asynchronous
I/O_0-I/O_{31}, I/O_{P1}-I/O_{P4}	Data Input / Output	I/O	Synchronous
V_{DD}, V_{DDQ}	Core Power, I/O Power	Supply	Static
V_{SS}	Ground	Supply	Static

5304 tbl 01

Pin Definitions(1)

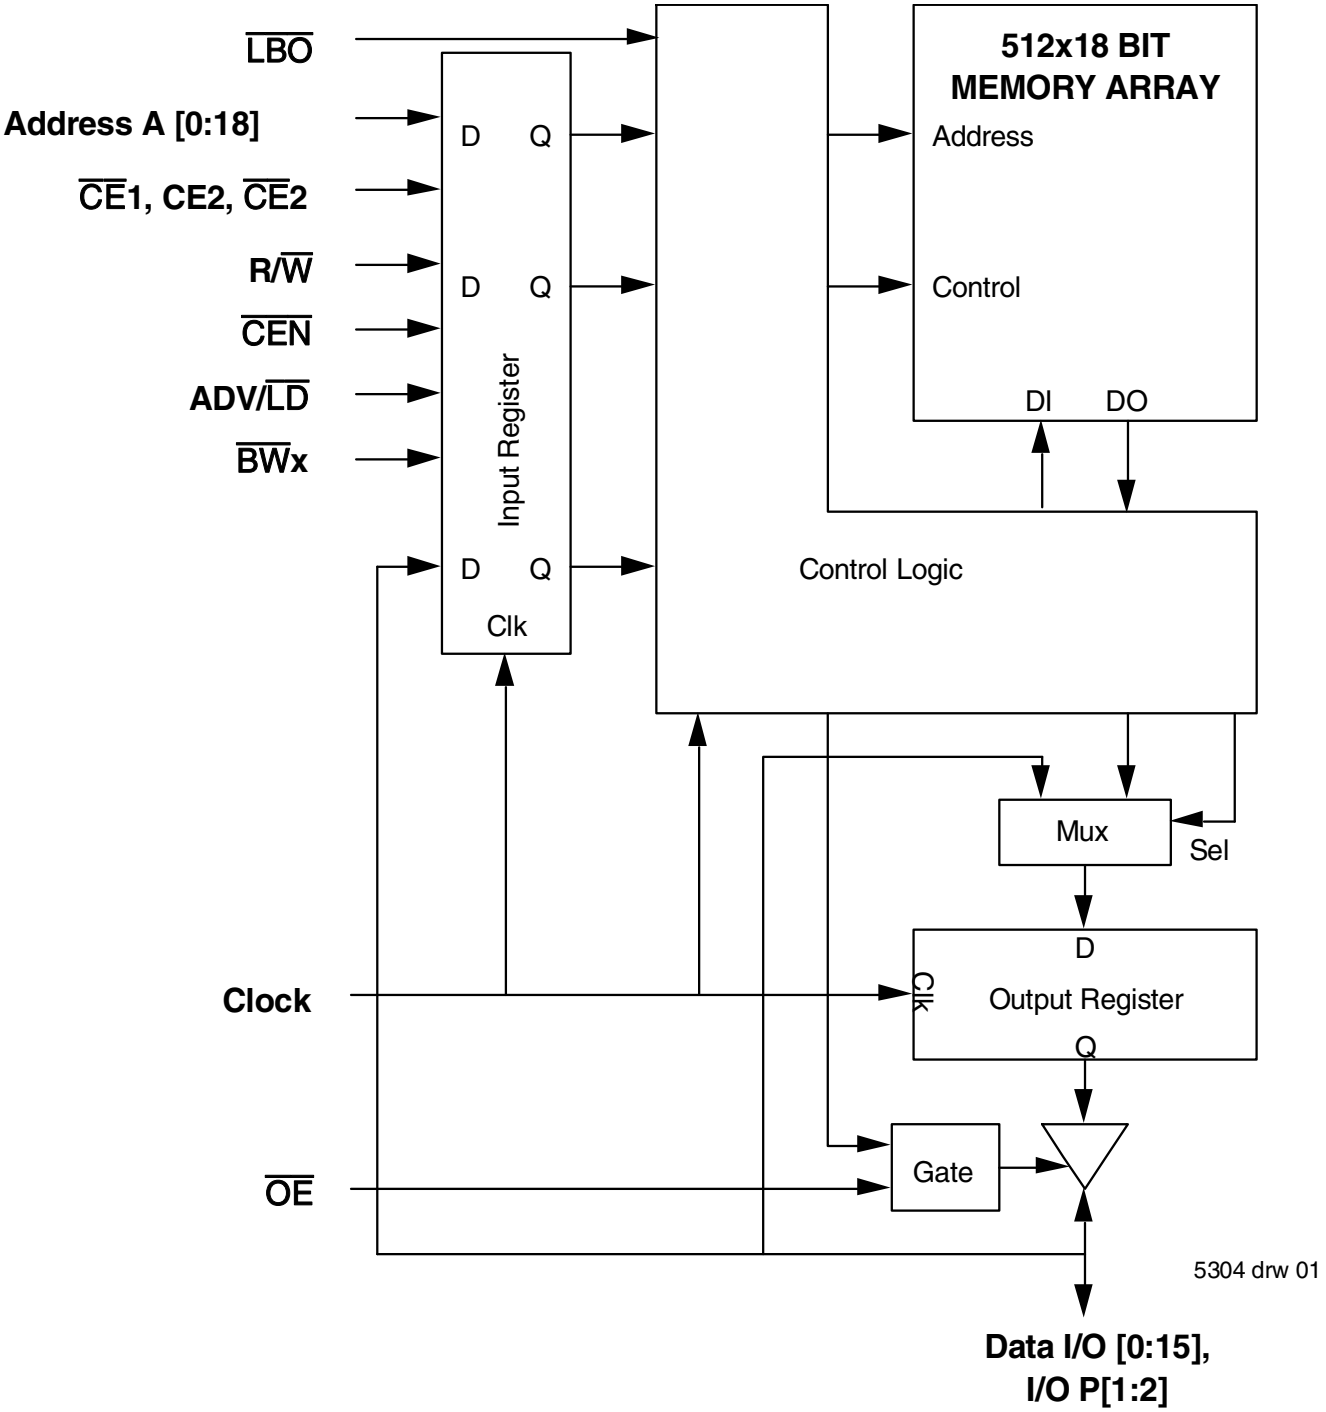
Symbol	Pin Function	I/O	Active	Description
A_0-A_{18}	Address Inputs	I	N/A	Synchronous Address inputs. The address register is triggered by a combination of the rising edge of CLK, ADV/$\overline{LD}$ low, $\overline{CEN}$ low, and true chip enables.
ADV/$\overline{LD}$	Advance / Load	I	N/A	ADV/$\overline{LD}$ is a synchronous input that is used to load the internal registers with new address and control when it is sampled low at the rising edge of clock with the chip selected. When ADV/$\overline{LD}$ is low with the chip deselected, any burst in progress is terminated. When ADV/$\overline{LD}$ is sampled high then the internal burst counter is advanced for any burst that was in progress. The external addresses are ignored when ADV/$\overline{LD}$ is sampled high.
R/$\overline{W}$	Read / Write	I	N/A	R/$\overline{W}$ signal is a synchronous input that identifies whether the current load cycle initiated is a Read or Write access to the memory array. The data bus activity for the current cycle takes place two clock cycles later.
$\overline{CEN}$	Clock Enable	I	LOW	Synchronous Clock Enable Input. When $\overline{CEN}$ is sampled high, all other synchronous inputs, including clock are ignored and outputs remain unchanged. The effect of $\overline{CEN}$ sampled high on the device outputs is as if the low to high clock transition did not occur. For normal operation, $\overline{CEN}$ must be sampled low at rising edge of clock.
$\overline{BW_1}$-$\overline{BW_4}$	Individual Byte Write Enables	I	LOW	Synchronous byte write enables. Each 9-bit byte has its own active low byte write enable. On load write cycles (When R/$\overline{W}$ and ADV/$\overline{LD}$ are sampled low) the appropriate byte write signal ($\overline{BW_1}$-$\overline{BW_4}$) must be valid. The byte write signal must also be valid on each cycle of a burst write. Byte Write signals are ignored when R/$\overline{W}$ is sampled high. The appropriate byte(s) of data are written into the device two cycles later. $\overline{BW_1}$-$\overline{BW_4}$ can all be tied low if always doing write to the entire 36-bit word.
$\overline{CE_1}$, $\overline{CE_2}$	Chip Enables	I	LOW	Synchronous active low chip enable. $\overline{CE_1}$ and $\overline{CE_2}$ are used with CE_2 to enable the AS8C 803601/ 801801 ($\overline{CE_1}$ or $\overline{CE_2}$ sampled high or CE_2 sampled low) and ADV/$\overline{LD}$ low at the rising edge of clock, initiates a deselect cycle. The ZBT™ has a two cycle deselect, i.e., the data bus will tri-state two clock cycles after deselect is initiated.
CE_2	Chip Enable	I	HIGH	Synchronous active high chip enable. CE_2 is used with $\overline{CE_1}$ and $\overline{CE_2}$ to enable the chip. CE_2 has inverted polarity but otherwise identical to $\overline{CE_1}$ and $\overline{CE_2}$.
CLK	Clock	I	N/A	This is the clock input to theAS8C803601/801801. Except for $\overline{OE}$, all timing references for the device are made with respect to the rising edge of CLK.
I/O_0-I/O_{31} I/O_{P1}-I/O_{P4}	Data Input/Output	I/O	N/A	Synchronous data input/output (I/O) pins. Both the data input path and data output path are registered and triggered by the rising edge of CLK.
$\overline{LBO}$	Linear Burst Order	I	LOW	Burst order selection input. When $\overline{LBO}$ is high the Interleaved burst sequence is selected. When $\overline{LBO}$ is low the Linear burst sequence is selected. $\overline{LBO}$ is a static input and it must not change during device operation.
$\overline{OE}$	Output Enable	I	LOW	Asynchronous output enable. $\overline{OE}$ must be low to read data from theAS8C803601/801801.When $\overline{OE}$ is high the I/O pins are in a high-impedance state. $\overline{OE}$ does not need to be actively controlled for read and write cycles. In normal operation, $\overline{OE}$ can be tied low.
ZZ	Sleep Mode	I	N/A	Asynchronous sleep mode input. ZZ HIGH will gate the CLK internally and power down the AS8C803601/801801to its lowest power consumption level.Data retention is guaranteed in Sleep Mode.
V_{DD}	Power Supply	N/A	N/A	3.3V core power supply.
V_{DDQ}	Power Supply	N/A	N/A	3.3V I/O Supply.
V_{SS}	Ground	N/A	N/A	Ground.

NOTE:

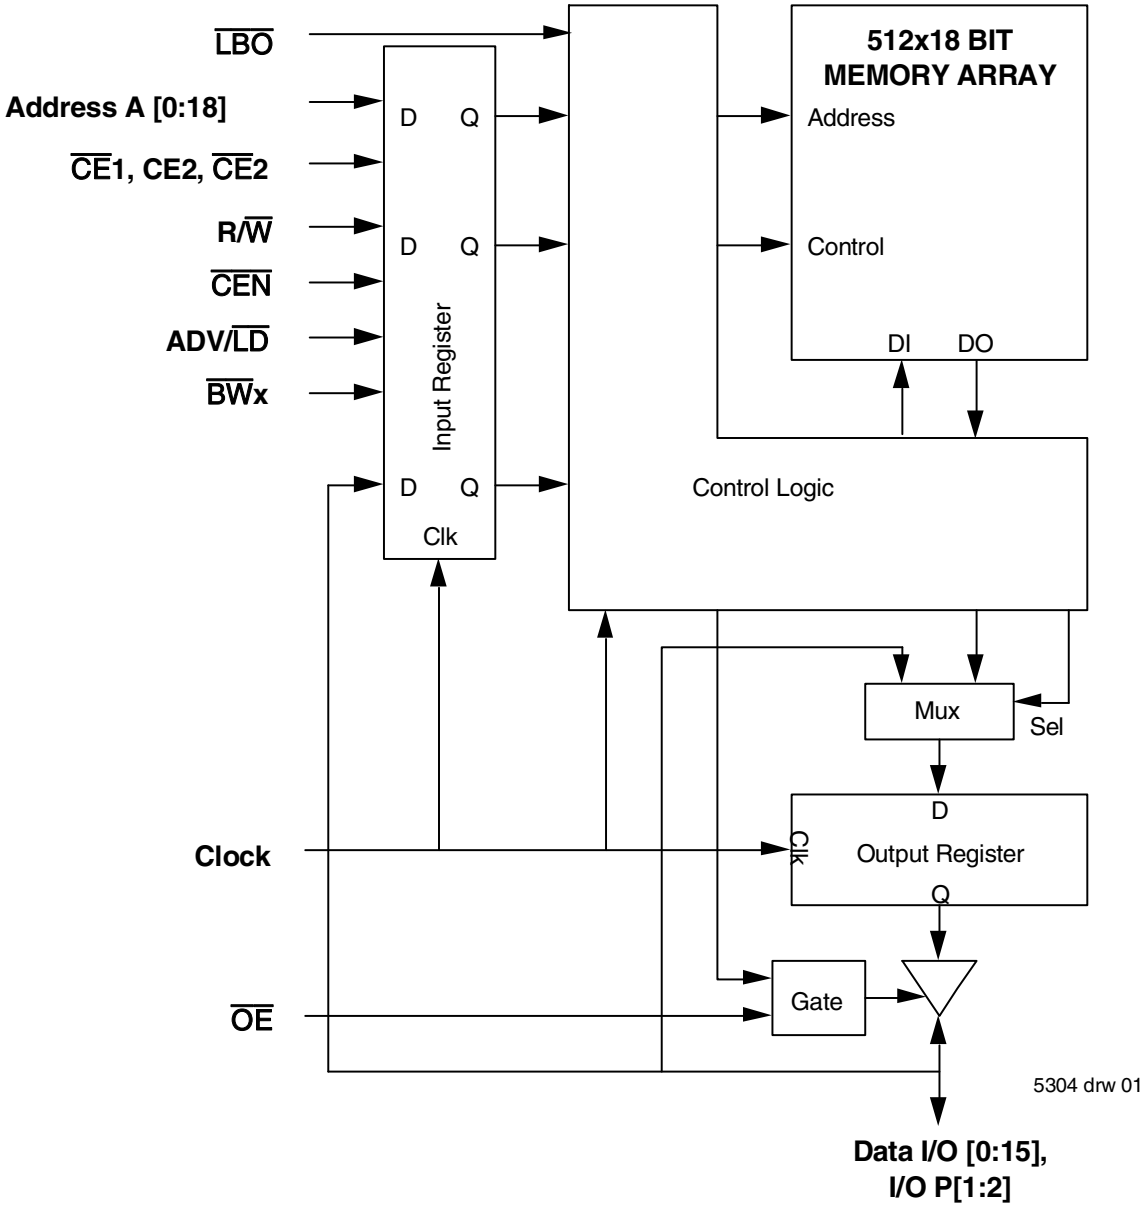
5304tbl 02

1. All synchronous inputs must meet specified setup and hold times with respect to CLK.

Functional Block Diagram



Functional Block Diagram



Recommended DC Operating Conditions

Symbol	Parameter	Min.	Typ.	Max.	Unit
V_{DD}	Core Supply Voltage	3.135	3.3	3.465	V
V_{DDQ}	I/O Supply Voltage	3.135	3.3	3.465	V
V_{SS}	Supply Voltage	0	0	0	V
V_{IH}	Input High Voltage - Inputs	2.0	—	V_{DD}+0.3	V
V_{IH}	Input High Voltage - I/O	2.0	—	V_{DDQ}+0.3	V
V_{IL}	Input Low Voltage	-0.3[1]	—	0.8	V

5304 tbl 04

NOTES:

1. V_{IL} (min.) = –1.0V for pulse width less than $t_{CYC}/2$, once per cycle.

Recommended Operating Temperature and Supply Voltage

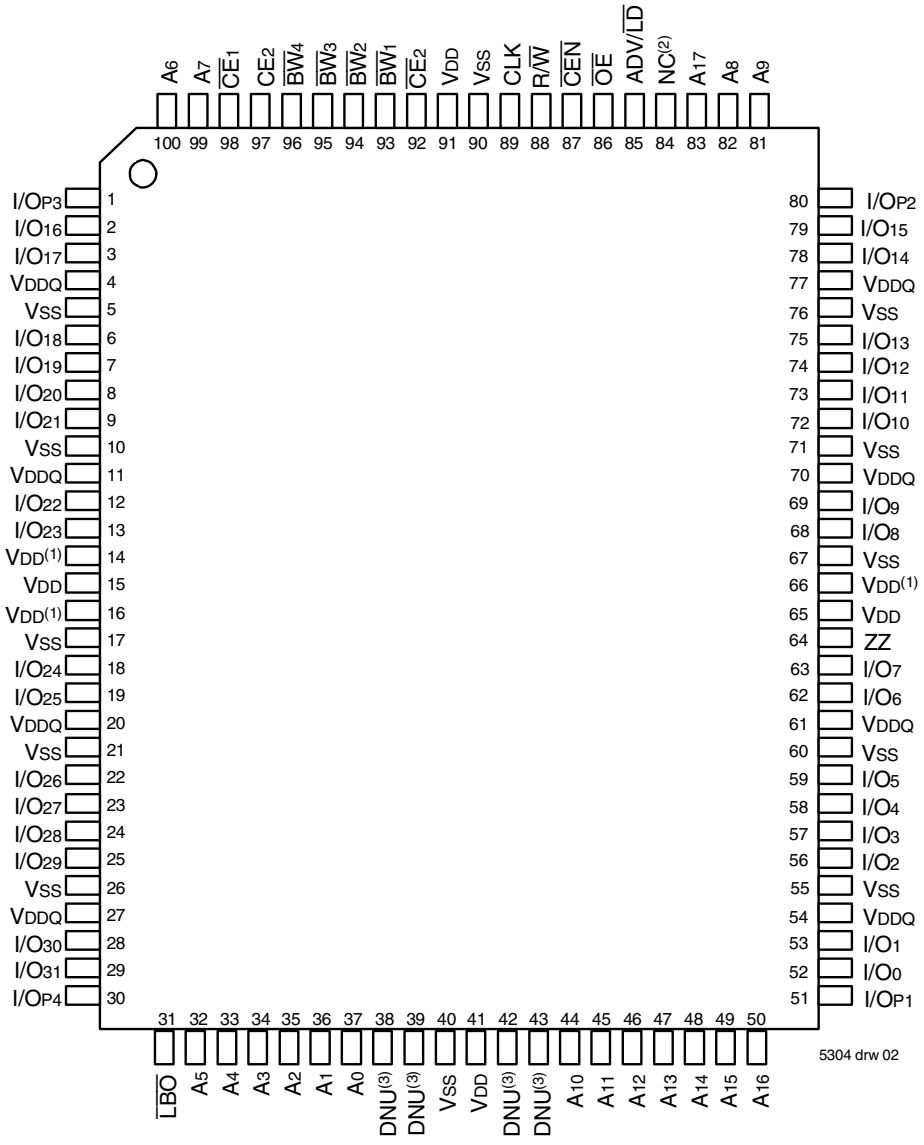
Grade	Ambient Temperature[1]	VSS	VDD	VDDQ
Commercial	0° C to +70° C	0V	3.3V±5%	3.3V±5%
Industrial	-40°C to +85°C	0V	3.3V±5%	3.3V±5%

5304 tbl 05

NOTES:

1. During production testing, the case temperature equals the ambient temperature .

Pin Configuration - 256K x 36

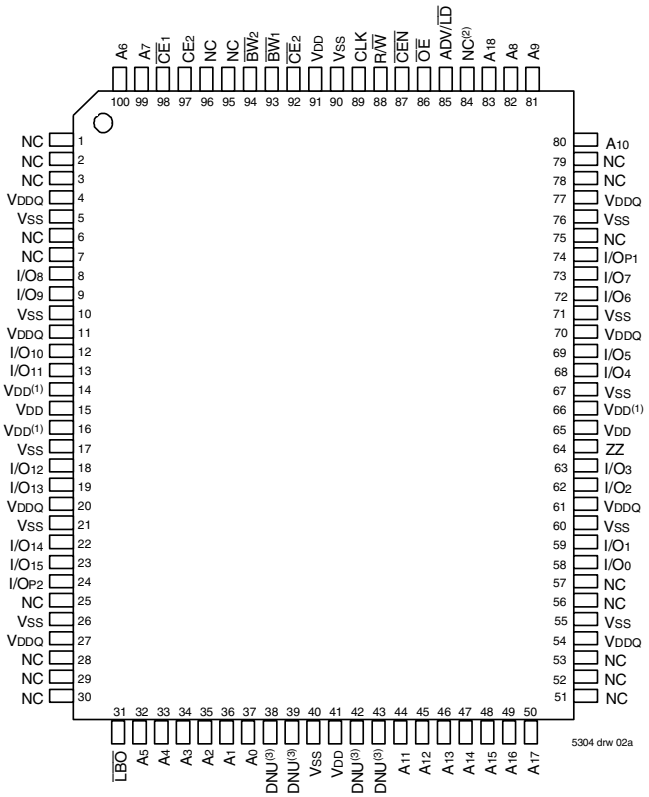


Top View 100 TQFP

NOTES:

1. Pins 14, 16 and 66 do not have to be connected directly to VDD as long as the input voltage is ≥ VIH.
2. Pin 84 is reserved for a future 16M.
3. DNU=Do not use. Pins 38, 39, 42 and 43 are reserved for respective JTAG pins: TMS, TDI, TDO and TCK. The current die revision allows these pins to be left unconnected, tied LOW (VSS), or tied HIGH (VDD).

Pin Configuration - 512K x 18



Top View
100 TQFP

NOTES:
1. Pins 14, 16 and 66 do not have to be connected directly to V_{DD} as long as the input voltage is $\geq V_{IH}$.
2. Pin 84 is reserved for a future 16M.
3. DNU=Do not use. Pins 38, 39, 42 and 43 are reserved for respective JTAG pins: TMS, TDI, TDO and TCK. The current die revision allows these pins to be left unconnected, tied LOW (V_{SS}), or tied HIGH (V_{DD}).

Absolute Maximum Ratings(1)

Symbol	Rating	Commercial & Industrial	Unit
V_{TERM}(2)	Terminal Voltage with Respect to GND	-0.5 to +4.6	V
V_{TERM}(3,6)	Terminal Voltage with Respect to GND	-0.5 to V_{DD}	V
V_{TERM}(4,6)	Terminal Voltage with Respect to GND	-0.5 to V_{DD} +0.5	V
V_{TERM}(5,6)	Terminal Voltage with Respect to GND	-0.5 to V_{DDQ} +0.5	V
T_A(7)	**Commercial** Operating Temperature	-0 to +70	°C
	Industrial Operating Temperature	-40 to +85	°C
T_{BIAS}	Temperature Under Bias	-55 to +125	°C
T_{STG}	Storage Temperature	-55 to +125	°C
P_T	Power Dissipation	2.0	W
I_{OUT}	DC Output Current	50	mA

5304 tbl 06

NOTES:
1. Stresses greater than those listed under ABSOLUTE MAXIMUM RATINGS may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect reliability.
2. V_{DD} terminals only.
3. V_{DDQ} terminals only.
4. Input terminals only.
5. I/O terminals only.
6. This is a steady-state DC parameter that applies after the power supply has reached its nominal operating value. Power sequencing is not necessary; however, the voltage on any input or I/O pin cannot exceed V_{DDQ} during power supply ramp up.
7. During production testing, the case temperature equals T_A.

100 TQFP Capacitance(1)

(T_A = +25° C, f = 1.0MHz)

Symbol	Parameter(1)	Conditions	Max.	Unit
C_{IN}	Input Capacitance	V_{IN} = 3dV	5	pF
$C_{I/O}$	I/O Capacitance	V_{OUT} = 3dV	7	pF

5304 tbl 07

119 BGA Capacitance(1)

(T_A = +25° C, f = 1.0MHz)

Symbol	Parameter(1)	Conditions	Max.	Unit
C_{IN}	Input Capacitance	V_{IN} = 3dV	7	pF
$C_{I/O}$	I/O Capacitance	V_{OUT} = 3dV	7	pF

5304 tbl 07a

NOTE:
1. This parameter is guaranteed by device characterization, but not production tested.

165 fBGA Capacitance(1)

(T_A = +25° C, f = 1.0MHz)

Symbol	Parameter(1)	Conditions	Max.	Unit
C_{IN}	Input Capacitance	V_{IN} = 3dV	TBD	pF
$C_{I/O}$	I/O Capacitance	V_{OUT} = 3dV	TBD	pF

Synchronous Truth Table(1)

$\overline{CEN}$	R/$\overline{W}$	Chip(5) Enable	ADV/$\overline{LD}$	$\overline{BW}$x	ADDRESS USED	PREVIOUS CYCLE	CURRENT CYCLE	I/O (2 cycles later)
L	L	Select	L	Valid	External	X	LOAD WRITE	D(7)
L	H	Select	L	X	External	X	LOAD READ	Q(7)
L	X	X	H	Valid	Internal	LOAD WRITE / BURST WRITE	BURST WRITE (Advance burst counter)(2)	D(7)
L	X	X	H	X	Internal	LOAD READ / BURST READ	BURST READ (Advance burst counter)(2)	Q(7)
L	X	Deselect	L	X	X	X	DESELECT or STOP(3)	HiZ
L	X	X	H	X	X	DESELECT / NOOP	NOOP	HiZ
H	X	X	X	X	X	X	SUSPEND(4)	Previous Value

5304 tbl 08

NOTES:

1. L = V_{IL}, H = V_{IH}, X = Don't Care.
2. When ADV/$\overline{LD}$ signal is sampled high, the internal burst counter is incremented. The R/$\overline{W}$ signal is ignored when the counter is advanced. Therefore the nature of the burst cycle (Read or Write) is determined by the status of the R/$\overline{W}$ signal when the first address is loaded at the beginning of the burst cycle.
3. Deselect cycle is initiated when either ($\overline{CE_1}$, or $\overline{CE_2}$ is sampled high or CE_2 is sampled low) and ADV/$\overline{LD}$ is sampled low at rising edge of clock. The data bus will tri-state two cycles after deselect is initiated.
4. When $\overline{CEN}$ is sampled high at the rising edge of clock, that clock edge is blocked from propogating through the part. The state of all the internal registers and the I/Os remains unchanged.
5. To select the chip requires $\overline{CE_1}$ = L, $\overline{CE_2}$ = L, CE_2 = H on these chip enables. Chip is deselected if any one of the chip enables is false.
6. Device Outputs are ensured to be in High-Z after the first rising edge of clock upon power-up.
7. Q - Data read from the device, D - data written to the device.

Partial Truth Table for Writes(1)

OPERATION	R/$\overline{W}$	$\overline{BW_1}$	$\overline{BW_2}$	$\overline{BW_3}$(3)	$\overline{BW_4}$(3)

WRITE BYTE 4 (I/O[24:31], I/O_{P4})(2,3)	L	H	H	H	L
NO RITE W	L	H	H	H	H

5304 tbl 09

NOTES:

1. L = V_{IL}, H = V_{IH}, X = Don't Care.
2. Multiple bytes may be selected during the same cycle.
3. N/A for X18 configuration.

Interleaved Burst Sequence Table ($\overline{LBO}$=VDD)

	Sequence 1		Sequence 2		Sequence 3		Sequence 4	
	A1	A0	A1	A0	A1	A0	A1	A0
First Address	0	0	0	1	1	0	1	1
Second Address	0	1	0	0	1	1	1	0
Third Address	1	0	1	1	0	0	0	1
Fourth Address(1)	1	1	1	0	0	1	0	0

5304 tbl 10

NOTE:
1. Upon completion of the Burst sequence the counter wraps around to its initial state and continues counting.

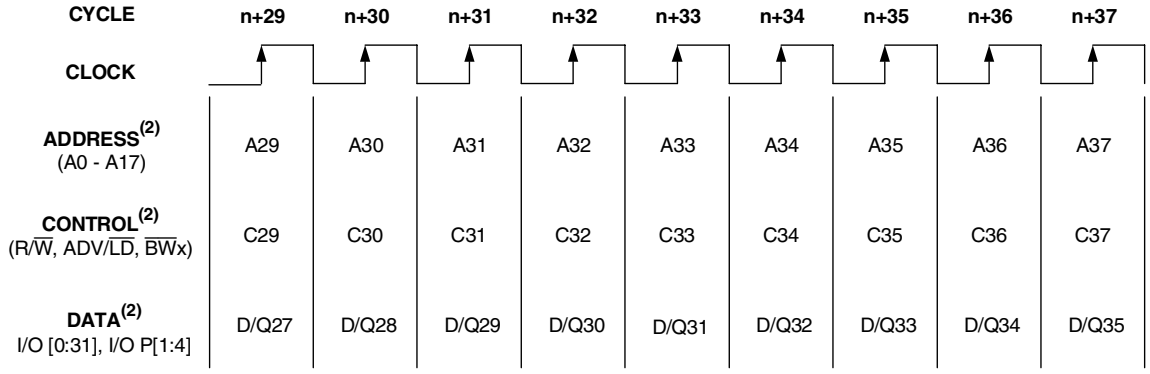
Linear Burst Sequence Table ($\overline{LBO}$=Vss)

	Sequence 1		Sequence 2		Sequence 3		Sequence 4	
	A1	A0	A1	A0	A1	A0	A1	A0
First Address	0	0	0	1	1	0	1	1
Second Address	0	1	1	0	1	1	0	0
Third Address	1	0	1	1	0	0	0	1
Fourth Address(1)	1	1	0	0	0	1	1	0

5304 tbl 11

NOTE:
1. Upon completion of the Burst sequence the counter wraps around to its initial state and continues counting.

Functional Timing Diagram(1)



5304 drw 03

NOTES:
1. This assumes $\overline{CEN}$, $\overline{CE}_1$, CE_2, $\overline{CE}_2$ are all true.
2. All Address, Control and Data_In are only required to meet set-up and hold time with respect to the rising edge of clock. Data_Out is valid after a clock-to-data delay from the rising edge of clock.

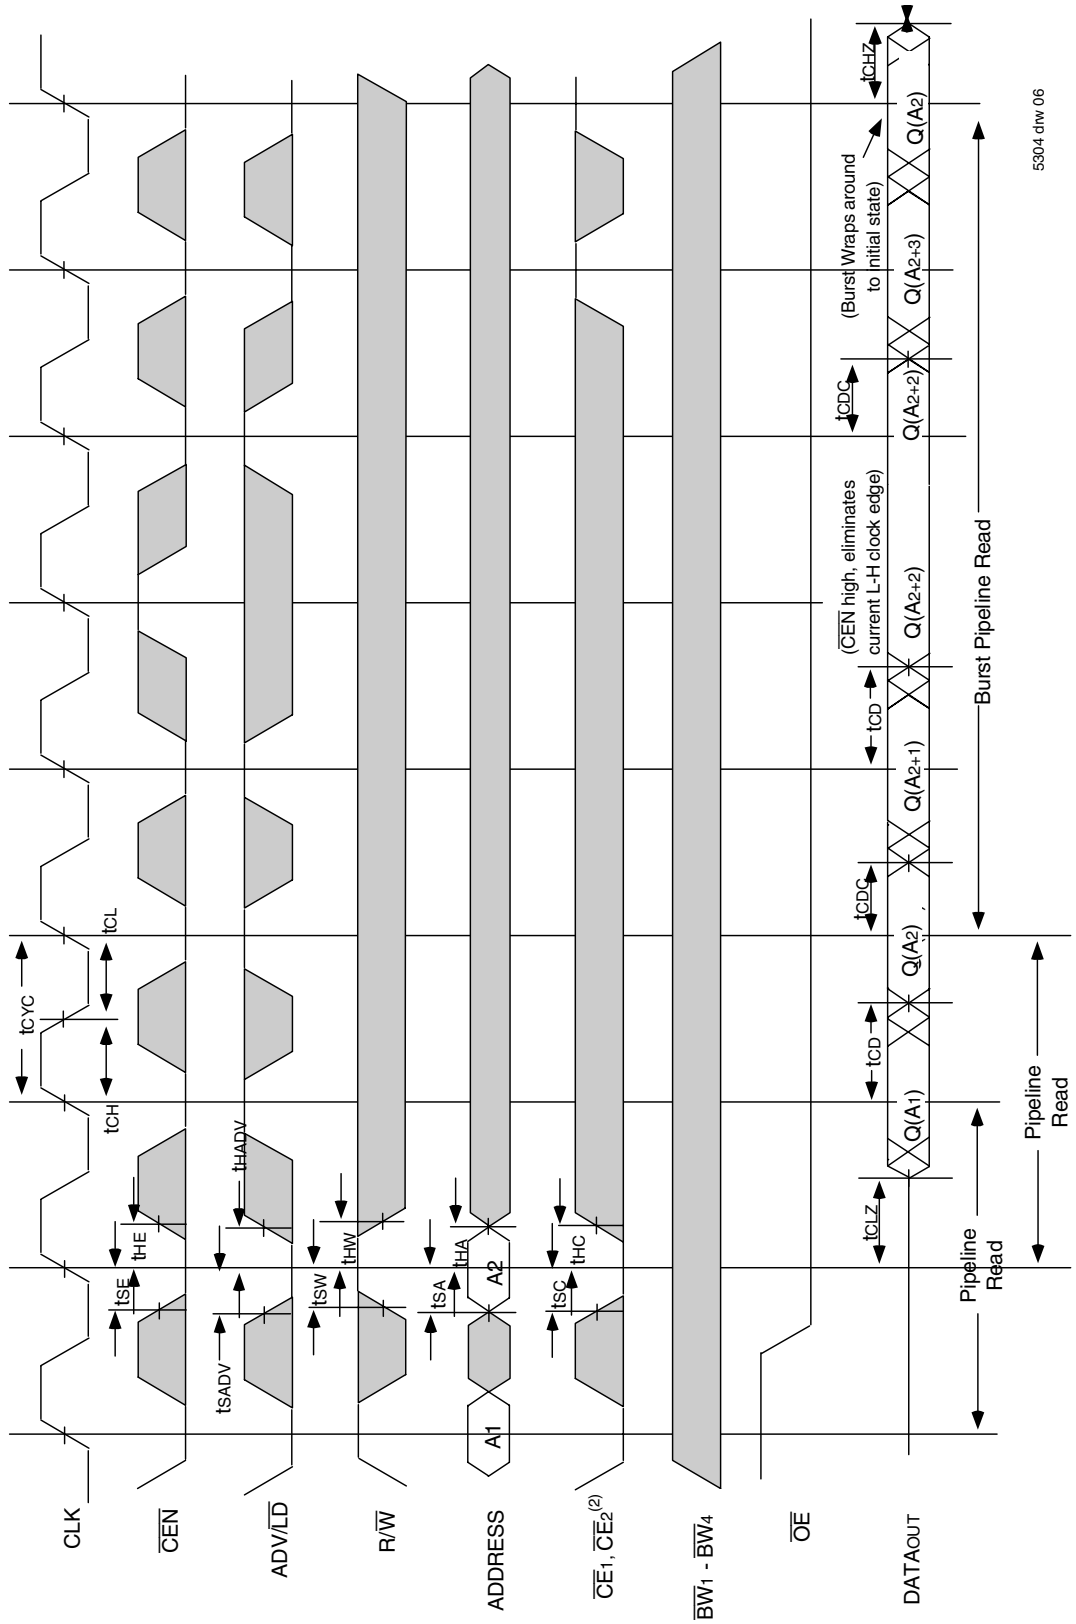
5304 tbl 24

NOTES:

1. $t_F = 1/t_{CYC}$.
2. Measured as HIGH above 0.6V $_{DDQ}$ and LOW below 0.4V $_{DDQ}$.
3. Transition is measured ±200mV from steady-state.
4. These parameters are guaranteed with the AC load (Figure 1) by device characterization. They are not production tested.
5. To avoid bus contention, the output buffers are designed such that t_{CHZ} (device turn-off) is about 1ns faster than t_{CLZ} (device turn-on) at a given temperature and voltage. The specs as shown do not imply bus contention because t_{CLZ} is a Min. parameter that is worse case at totally different test conditions (0 deg. C, 3.465V) than t_{CHZ}, which is a Max. parameter (worse case at 70 deg. C, 3.135V).

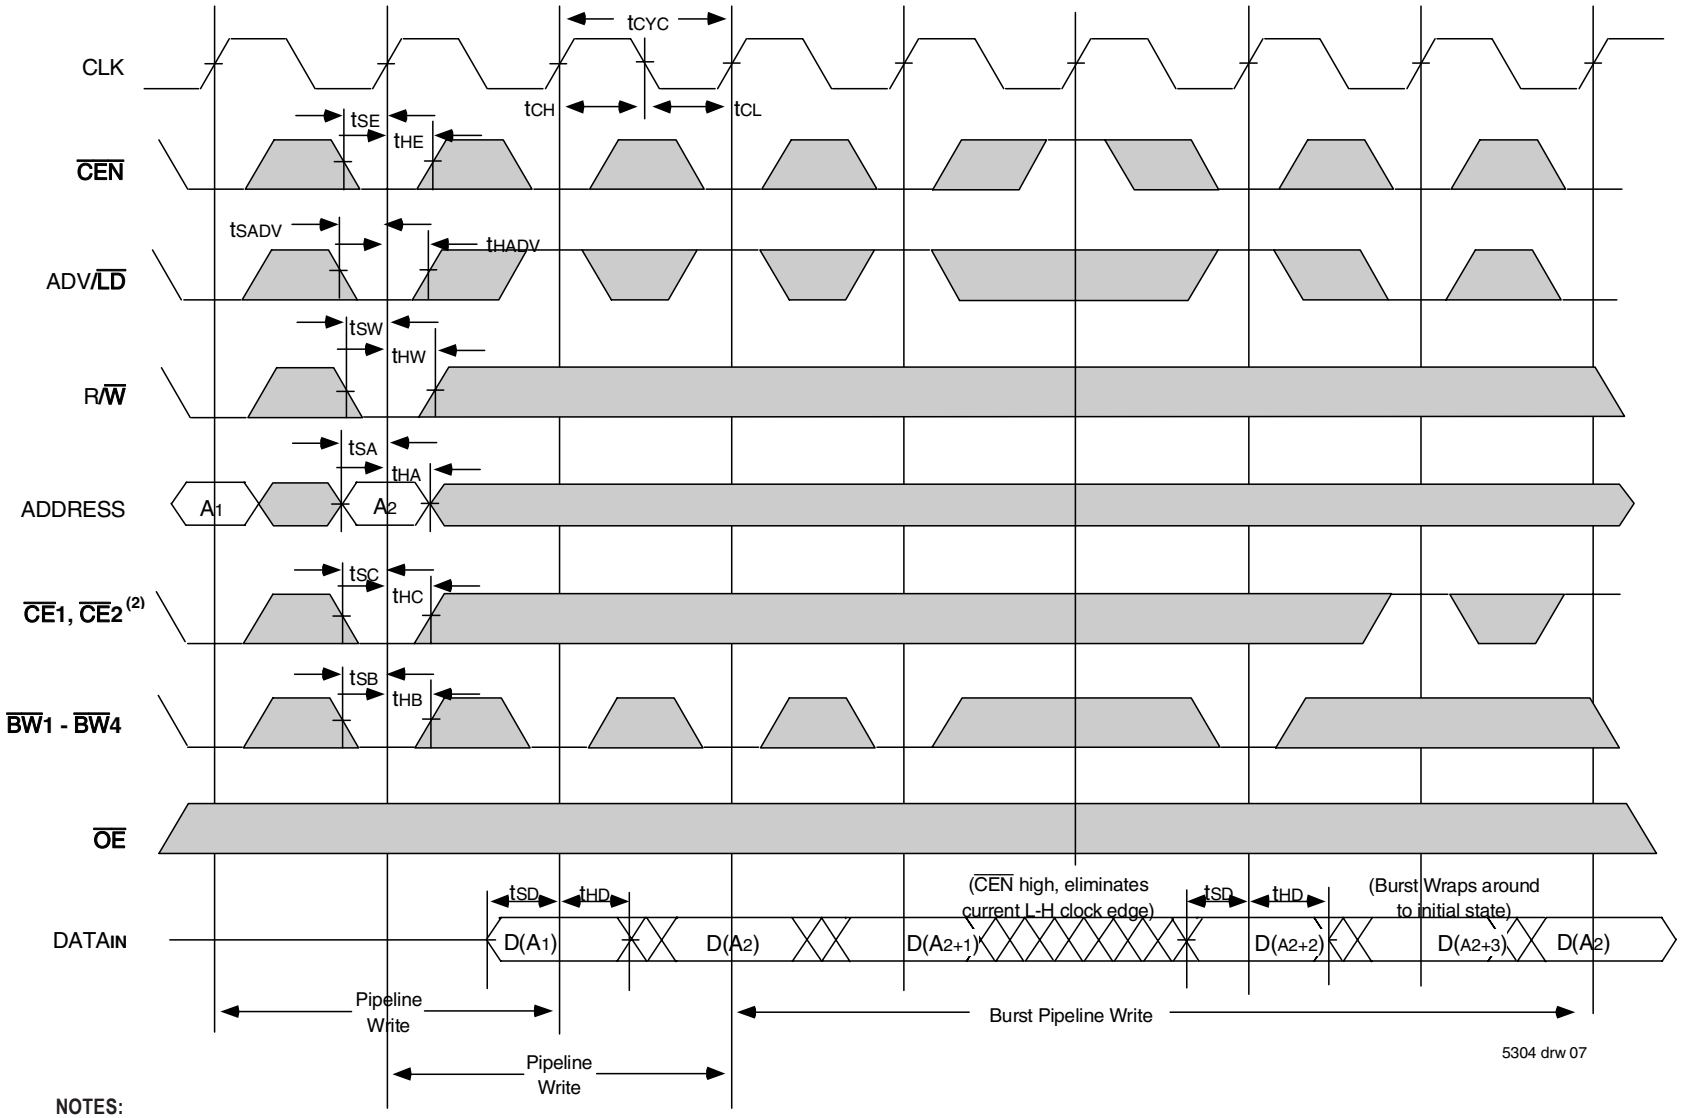
Timing Waveform of Read Cycle[1,2,3,4]



NOTES:

1. Q (A) represents the first output from the external address A. Q (A2) represents the first output from the external address A2. Q (A2+1) represents the next output data in the burst sequence of the base address A2, etc. where address bits A0 and A1 are advancing for the four word burst in the sequence defined by the state of the LBO input.
2. CE2 timing transitions are identical but inverted to the CE1 and CE2 signals. For example, when CE1 and CE2 are LOW on this waveform, CE2 is HIGH.
3. Burst ends when new address and control are loaded into the SRAM by sampling ADV/ LD LOW.
4. R/W is don't care when the SRAM is bursting (ADV/ LD sampled HIGH). The nature of the burst access (Read or Write) is fixed by the state of the R/ W signal when new address and control are loaded into the SRAM.

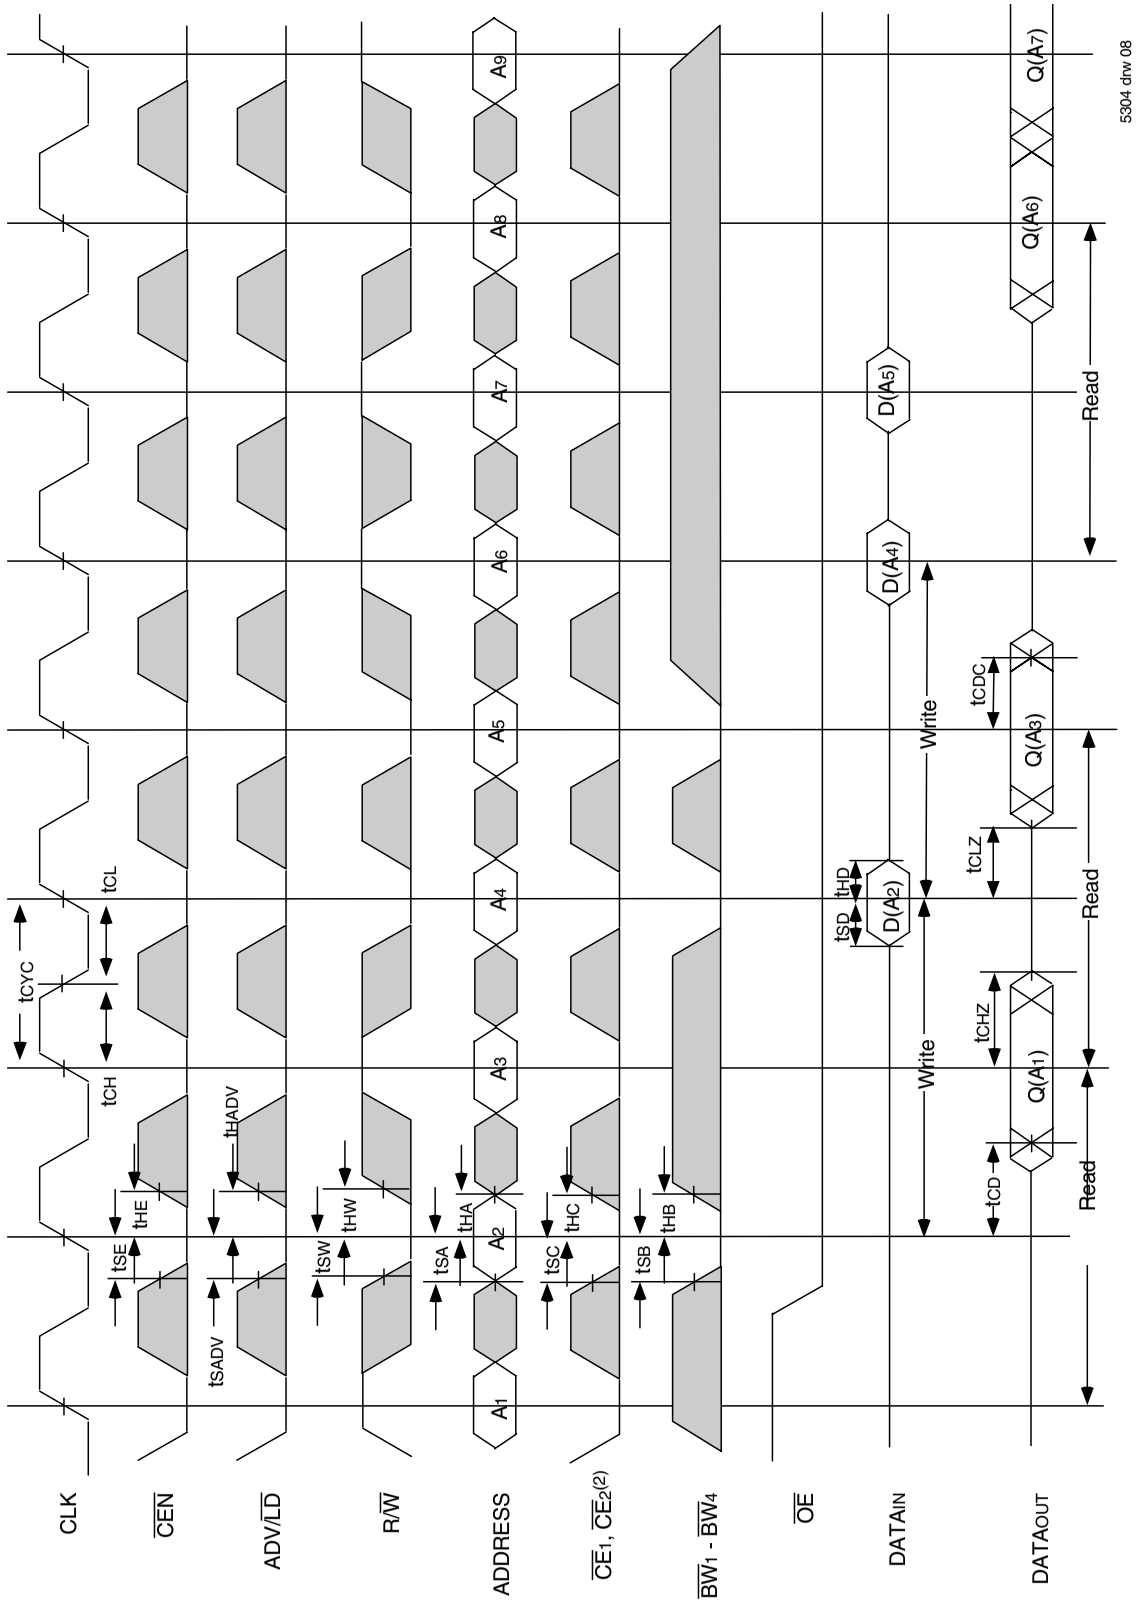
Timing Waveform of Write Cycles(1,2,3,4,5)



NOTES:

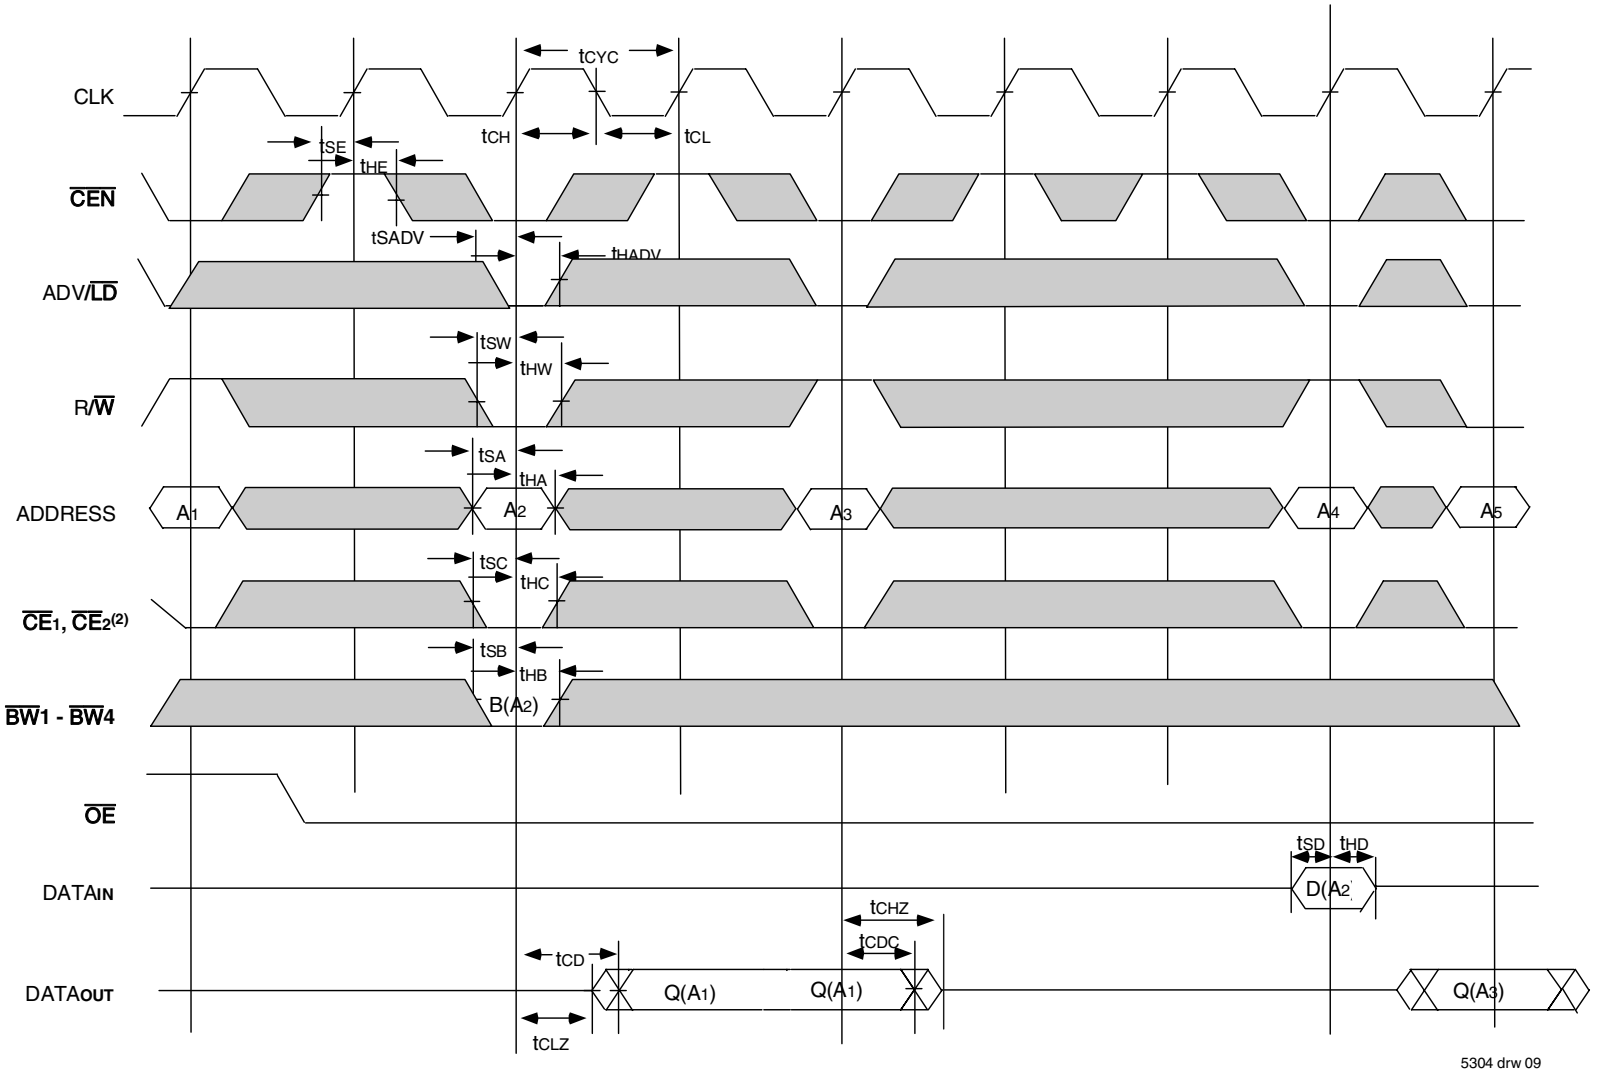
1. D (A_1) represents the first input to the external address A_1. D (A_2) represents the first input to the external address A_2; D (A_{2+1}) represents the next input data in the burst sequence of the base address A_2, etc. where address bits A_0 and A_1 are advancing for the four word burst in the sequence defined by the state of the $\overline{LBO}$ input.
2. CE_2 timing transitions are identical but inverted to the $\overline{CE}_1$ and $\overline{CE}_2$ signals. For example, when $\overline{CE}_1$ and $\overline{CE}_2$ are LOW on this waveform, CE2 is HIGH.
3. Burst ends when new address and control are loaded into the SRAM by sampling ADV/ $\overline{LD}$ LOW.
4. R/$\overline{W}$ is don't care when the SRAM is bursting (ADV/ $\overline{LD}$ sampled HIGH). The nature of the burst access (Read or Write) is fixed by the state of the R/ $\overline{W}$ signal when new address and control are loaded into the SRAM.
5. Individual Byte Write signals ($\overline{BW}$x) must be valid on all write and burst-write cycles. A write cycle is initiated when R$\overline{W}$ signal is sampled LOW. The byte write information comes in two cycles before the actual data is presented to the SRAM.

Timing Waveform of Combined Read and Write Cycles(1,2,3)



NOTES:
1. Q (A_1) represents the first output from the external address A_1. D (A_2) represents the input data to the SRAM corresponding to address A_2.
2. CE_2 timing transitions are identical but inverted to the $\overline{CE}_1$ and $\overline{CE}_2$ signals. For example, when $\overline{CE}_1$ and $\overline{CE}_2$ are LOW on this waveform, CE_2 is HIGH.
3. Individual Byte Write signals ($\overline{BW}x$) must be valid on all write and burst-write cycles. A write cycle is initiated when $R\overline{W}$ signal is sampled LOW. The byte write information comes in two cycles before the actual data is presented to the SRAM.

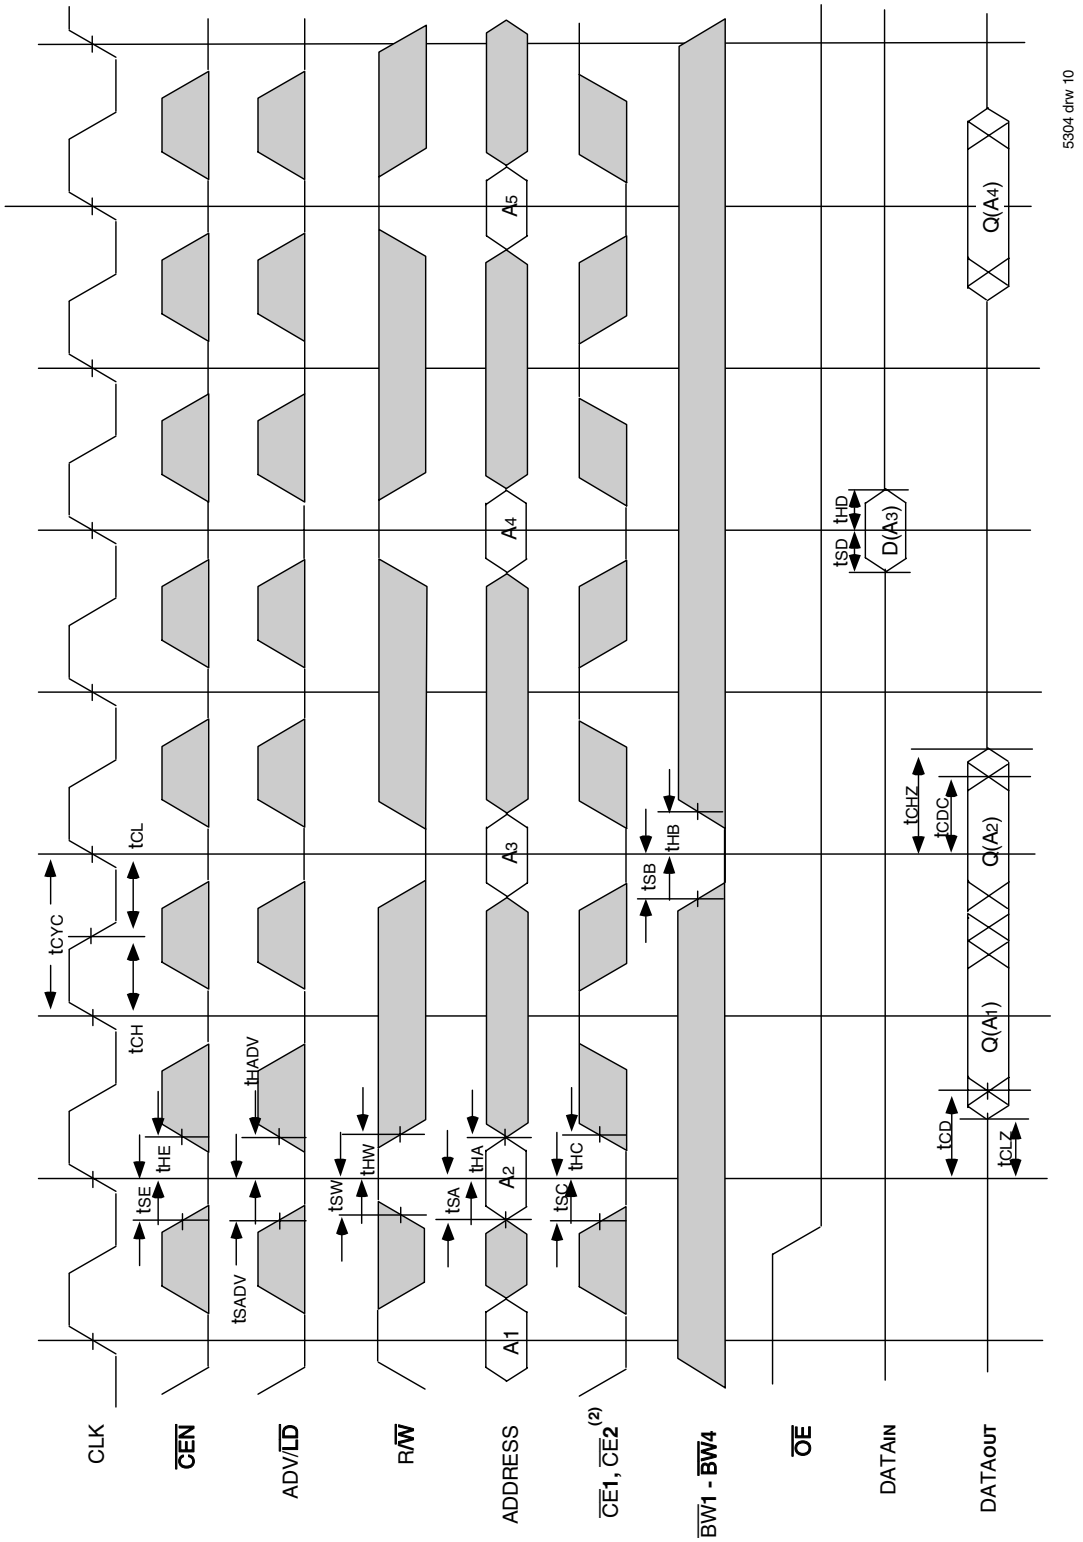
Timing Waveform of $\overline{CEN}$ Operation(1,2,3,4)



NOTES:

1. Q (A_1) represents the first output from the external address A_1. D (A_2) represents the input data to the SRAM corresponding to address A_2.
2. $\overline{CE}_2$ timing transitions are identical but inverted to the $\overline{CE}_1$ and $\overline{CE}_2$ signals. For example, when $\overline{CE}_1$ and $\overline{CE}_2$ are LOW on this waveform, $\overline{CE}_2$ is HIGH.
3. $\overline{CEN}$ when sampled high on the rising edge of clock will block that L-H transition of the clock from propogating into the SRAM. The part will behave as if the L-H clock transition did not occur. All internal registers in the SRAM will retain their previous state.
4. Individual Byte Write signals ($\overline{BW}x$) must be valid on all write and burst-write cycles. A write cycle is initiated when $R\overline{W}$ signal is sampled LOW. The byte write information comes in two cycles before the actual data is presented to the SRAM.

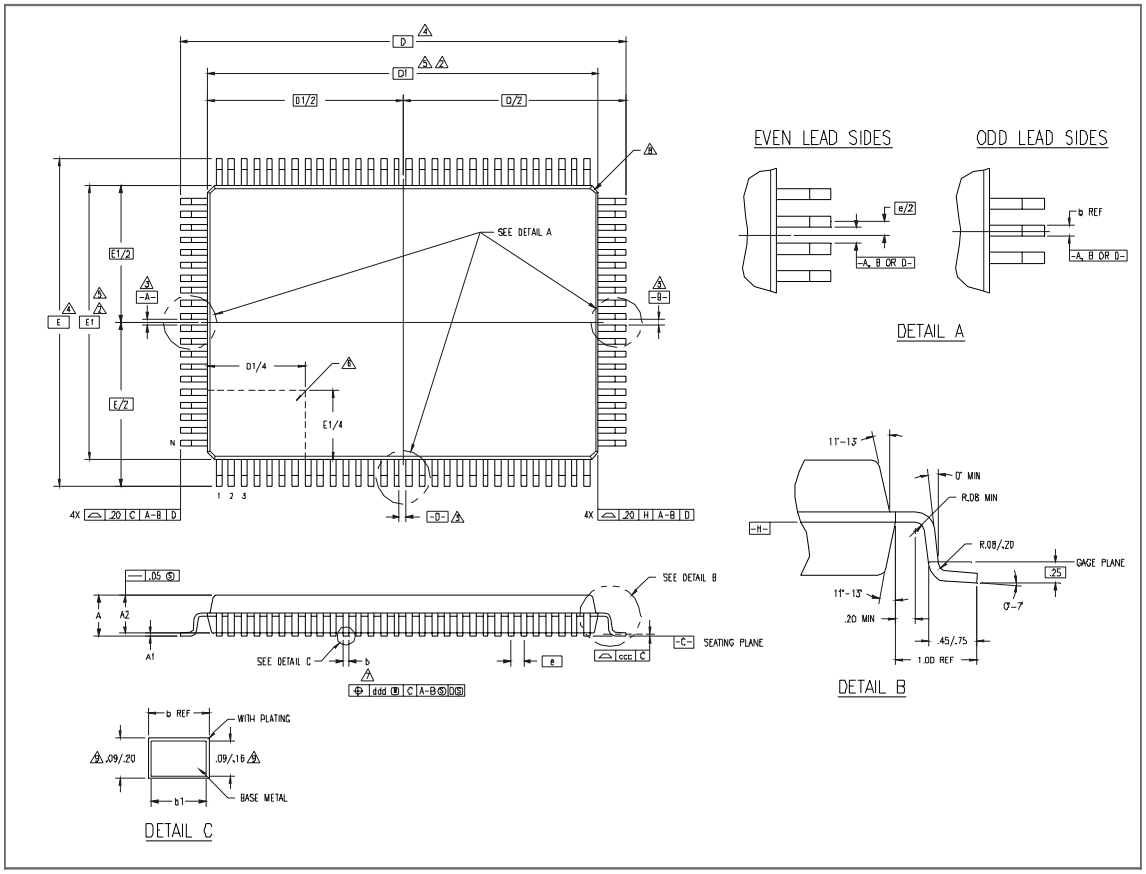
Timing Waveform of $\overline{CS}$ Operation(1,2,3,4)



NOTES:

1. Q (A1) represents the first output from the external address A. D (A) represents the input data to the SRAM corresponding to address A.
2. $\overline{CE}_2$ timing transitions are identical but inverted to the $\overline{CE}_1$ and $\overline{CE}_2$ signals. For example, when $\overline{CE}_1$ and $\overline{CE}_2$ are LOW on this waveform, $\overline{CE}_2$ is HIGH.
3. $\overline{CEN}$ when sampled high on the rising edge of clock will block that L-H transition of the clock from propogating into the SRAM. The part will behave as if the L-H clock transition did not occur. All internal registers in the SRAM will retain their previous state.
4. Individual Byte Write signals ($\overline{BW}x$) must be valid on all write and burst-write cycles. A write cycle is initiated when $R\overline{W}$ signal is sampled LOW. The byte write information comes in two cycles before the actual data is presented to the SRAM.

100-Pin Plastic Thin Quad Flatpack (TQFP) Package Diagram Outline



SYMBOL	JEDEC VARIATION BJ			NOTE
	MIN	NOM	MAX

1 ALL DIMENSIONING AND TOLERANCING CONFORM TO ANSI Y14.5M–1982

2 TOP PACKAGE MAY BE SMALLER THAN BOTTOM PACKAGE BY .15 mm

3 DATUMS -A-B- AND -D- TO BE DETERMINED AT DATUM PLANE -H-

4 DIMENSIONS D AND E ARE TO BE DETERMINED AT SEATING PLANE -C-

5 DIMENSIONS D1 AND E1 DO NOT INCLUDE MOLD PROTRUSION. ALLOWABLE MOLD PROTRUSION IS .25 mm PER SIDE. D1 AND E1 ARE MAXIMUM BODY SIZE DIMENSIONS INCLUDING MOLD MISMATCH

6 DETAILS OF PIN 1 IDENTIFIER IS OPTIONAL BUT MUST BE LOCATED WITHIN THE ZONE INDICATED

7 DIMENSION b DOES NOT INCLUDE DAMBAR PROTRUSION. ALLOWABLE DAMBAR PROTRUSION IS .08 mm IN EXCESS OF THE b DIMENSION AT MAXIMUM MATERIAL CONDITION. DAMBAR CANNOT BE LOCATED ON THE LOWER RADIUS OR THE FOOT.

8 EXACT SHAPE OF EACH CORNER IS OPTIONAL

9 THESE DIMENSIONS APPLY TO THE FLAT SECTION OF THE LEAD BETWEEN .10 AND .25 mm FROM THE LEAD TIP

10 ALL DIMENSIONS ARE IN MILLIMETERS

11 THIS OUTLINE CONFORMS TO JEDEC PUBLICATION 95 REGISTRATION MO–136, VARIATION BJ AND BK

LAND PATTERN DIMENSIONS
