

## FEATURES

- Single-Supply Operation from +3V ~ +24V
- Dual-Supply Operation from 1.5V ~ 12V
- Gain-Bandwidth Product: 1MHz (Typ.)
- Low Input Bias Current: 45nA ±(Typ.)
- Low Offset Voltage: 5mV (Max.)
- Quiescent Current: 250µA per Amplifier (Typ.)
- Operating Temperature: -25°C ~ +80°C
- Small Package:  
CBMLM321 Available in SOT23-5 SC70-5 Packages  
CBMLM358 Available in SOP-8 and MSOP-8 Packages  
CBMLM324 Available in SOP-14 Package

## DESCRIPTION

The CBMLM358 family have a high gain-bandwidth product of 1MHz, a slew rate of 0.4V/µs, and a quiescent current of 250µA/amplifier at 5V. The CBMLM358 family is designed to provide optimal performance in low voltage and low noise systems.

The maximum input offset voltage is 5mV for CBMLM358 family. The operating range is from 3V to 24V. The CBMLM321 single is available in Green SOT-23-5 packages. The CBMLM358 Dual is available in Green SOP-8 and MSOP-8 packages. The CBMLM324 Quad is available in Green SOP-14 package.

## APPLICATIONS

- Walkie-Talkie
- Battery Management Solution
- Transducer Amplifiers
- Summing Amplifiers
- Multivibrators
- Oscillators
- Portable Systems

## PIN CONFIGURATIONS

## ABSOLUTE MAXIMUM RATINGS

Condition	Symbol	Max
Power Supply Voltage	$V_{CC}$	$\pm 12V$ or 24V
Differential input voltage	$V_{I(DIFF)}$	24V
Input Voltage	$V_I$	-0.3V~24V
Operating Temperature Range	$T_{opr}$	-25°C ~ +80°C
Storage Temperature Range	$T_{stg}$	-65°C ~ +150°C

**Note:** Stress greater than those listed under Absolute Maximum Ratings may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions outside those indicated in the operational sections of this specification are not implied. Exposure to absolute maximum rating conditions for extended periods may affect reliability.

## ESD SENSITIVITY CAUTION

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

## ELECTRICAL CHARACTERISTICS

(At  $V_S = +15V$ ,  $T_A = 25^\circ C$ , unless otherwise noted.)

PARAMETER	SYMBOL	CONDITIONS	CBMLM321/CBMLM358/CBMLM324

## **APPLICATION NOTES**

### **Size**

CBMLM358 family series op amps are unity-gain stable and suitable for a wide range of general-purpose applications. The small footprints of the CBMLM358 family packages save space on printed circuit boards and enable the design of smaller electronic products.

### **Power Supply Bypassing and Board Layout**

CBMLM358 family series operates from a single 3V to 24V supply or dual  $\pm 1.5V$  to  $\pm 12V$  supplies. For best performance, a  $0.1\mu F$  ceramic capacitor should be placed close to the  $V_{DD}$  pin in single supply operation. For dual supply operation, both  $V_{DD}$  and  $V_{SS}$  supplies should be bypassed to ground with separate  $0.1\mu F$  ceramic capacitors.

### **Low Supply Current**

The low supply current (typical 250uA per channel) of CBMLM358 family will help to maximize battery life.

### **Operating Voltage**

CBMLM358 family operates under wide input supply voltage (3V to 24V). In addition, all temperature specifications apply from  $-25^{\circ}C$  to  $+80^{\circ}C$ . Most behavior remains unchanged throughout the full operating voltage range. These guarantees ensure operation throughout the single Li-Ion battery lifetime

### **Capacitive Load Tolerance**

The CBMLM358 family is optimized for bandwidth and speed, not for driving capacitive loads. Output capacitance will create a pole in the amplifier's feedback path, leading to excessive peaking and potential oscillation. If dealing with load capacitance is a requirement of the application, the two strategies to consider are (1) using a small resistor in series with the amplifier's output and the load capacitance and (2) reducing the bandwidth of the amplifier's feedback loop by increasing the overall noise gain. Figure 2. shows a unity gain follower using the series resistor strategy. The resistor isolates the output from the capacitance and, more importantly, creates a zero in the feedback path that compensates for the pole created by the output capacitance.

Figure 2. Indirectly Driving a Capacitive Load Using Isolation Resistor

The bigger the  $R_{ISO}$  resistor value, the more stable  $V_{OUT}$  will be. However, if there is a resistive load  $R_L$  in parallel with the capacitive load, a voltage divider (proportional to  $R_{ISO}/R_L$ ) is formed, this will result in a gain error.

The circuit in Figure 3 is an improvement to the one in Figure 2.  $R_F$  provides the DC accuracy by feed-forward the  $V_{IN}$  to  $R_L$ .  $C_F$  and  $R_{ISO}$  serve to counteract the loss of phase margin by feeding the high frequency component of the output signal back to the amplifier's inverting input, thereby preserving the phase margin in the overall feedback loop. Capacitive drive can be increased by increasing the value of  $C_F$ . This in turn will slow down the pulse response.

Figure 3. Indirectly Driving a Capacitive Load with DC Accuracy

## Typical Application Circuits

### Differential amplifier

The differential amplifier allows the subtraction of two input voltages or cancellation of a signal common the two inputs. It is useful as a computational amplifier in making a differential to single-end conversion or in rejecting a common mode signal. Figure 4. shown the differential amplifier using CBMLM358 family.

Figure 4. Differential Amplifier

$$V_{OUT} = \left( \frac{R_1 + R_2}{R_3 + R_4} \right) \frac{R_4}{R_1} V_{IN} - \frac{R_2}{R_1} V_{IP} + \left( \frac{R_1 + R_2}{R_3 + R_4} \right) \frac{R_3}{R_1} V_{REF}$$

If the resistor ratios are equal (i.e.  $R_1=R_3$  and  $R_2=R_4$ ), then

$$V_{OUT} = \frac{R_2}{R_1} (V_{IP} - V_{IN}) + V_{REF}$$

## Low Pass Active Filter

The low pass active filter is shown in Figure 5. The DC gain is defined by  $-R_2/R_1$ . The filter has a -20dB/decade roll-off after its corner frequency  $f_c=1/(2\pi R_3C_1)$ .

Figure 5. Low Pass Active Filter

## Instrumentation Amplifier

The triple CBMLM358 family can be used to build a three-op-amp instrumentation amplifier as shown in Figure 6. The amplifier in Figure 6 is a high input impedance differential amplifier with gain of  $R_2/R_1$ . The two differential voltage followers assure the high input impedance of the amplifier.
