

# Type THA, ThinPack, Aluminum Electrolytic Capacitor, 85 °C

## High Energy Density, REACH and RoHS Compliant

## Type THA now has longer life!

At 8.2 mm thin, type THA Thinpack offers the highest energy density available in a low profile aluminum electrolytic. It's ideal for the lowest profile circuits where high capacitance is needed for bulk storage. Look to type THA to replace arrays of SMT solid tantalum or aluminum electrolytic capacitors.

### Highlights

- 8.2 mm profile
- Very high energy density (up to 1.1 J/cc)
- 5000 hr life @ 85 °C (All 2020 production and beyond)
- [REACH and RoHS Compliant](#)

### Specifications

Temperature Range	-55 °C to +85 °C ≤300 Vdc; -40 °C to 85 °C ≥350 Vdc																																																																																															
Rated Voltage Range	10 Vdc to 450 Vdc																																																																																															
Capacitance Range	60 µF to 18000 µF																																																																																															
Capacitance Tolerance	±20%																																																																																															
Leakage Current	≤ 0.002 CV µA, @ 25 °C and 5 mins. at rated voltage

<p><b>Vibration</b> <i>Mounting: Vibration capability is dependent upon mounting restraint.</i></p> <p><b>Vibration Test</b></p>	<p>All Sizes = 10g</p> <p><b>Level</b> The specimens, while deenergized or operating under the load conditions specified, shall be subjected to the vibration amplitude, frequency range, and duration specified for each case size.</p> <p><b>Amplitude</b> The specimens shall be subjected to a simple harmonic motion having an amplitude of either 0.06-inch double amplitude (maximum total excursion) or peak level specified above, whichever is less. The tolerance on vibration amplitude shall be ±10 percent.</p> <p><b>Frequency Range</b> The vibration frequency shall be varied logarithmically between the approximate limits of 10 to 2,000 Hz.</p> <p><b>Sweep Time and Duration</b> The entire frequency range of 10 to 2,000 Hz and return to 10 Hz shall be traversed in 20 minutes. This cycle shall be performed 12 times in each of three mutually perpendicular directions (total of 36 times), so that the motion shall be applied for a total period of approximately 12 hours. Interruptions are permitted provided the requirements for rate of change and test duration are met.</p>																																		
<p><b>Altitude</b></p>	<p>80,000 Feet</p>

<p><b>Typical Weight</b></p>	<p>Case AA - 14g, Case AB - 16g, Case AC - 18g, Case AD - 20g</p>																																		
<p><b>Terminals</b></p>	<p>20 AWG copper wire with tin electroplate, 15 amps max</p>																																		
<p><b>Case Material</b></p>	<p>Aluminum</p>																																		
<p><b>Ripple Current Capability</b></p>	<p>The max ripple current capability is set by the target core temperature of 85 °C. The Peak to Peak ac must be less than <math>V_r/5</math>.</p>																																		
<p><b>Air Cooled</b></p>	<p>The ripple currents in the ratings tables are for 65 °C ambient temperatures.</p>																																		
<p><b>Heatsink Cooled</b></p>	<p>Temperature rise from the hottest internal spot, the core, to ambient air is</p> $\Delta T = I^2(\text{Max ESR})(\theta_{cc} + \theta_{ca}), \text{ recommended max } \Delta T \text{ of } 20 \text{ }^\circ\text{C}$ <p>where <math>\theta_{cc}</math> is the thermal resistance from core to case and <math>\theta_{ca}</math> from case to ambient. To calculate maximum ripple capability with the THA attached to a heatsink use the maximum core temperature and the values for <math>\theta_{cc}</math>.</p>																																		
<p><b>Example</b></p>	<p>As an illustration, suppose you operate a noninsulated THA132M060AAOC in 65 °C air and attach it to a commercial heatsink with a free-air thermal resistance of 2.7 °C/W. Use a good thermal grease between the capacitor and the heatsink, and the total thermal resistance is 2.7 + 5.42 or 8.12 °C/W. The power which would heat the core to 85 °C is <math>(85 - 65)/8.12</math> or 2.46 W. For an ESR of 117 mΩ, 2.46 W equates to a ripple current of 4.58 A.</p>

The customer is responsible for checking, confirming and verifying the extent to which the Information contained in this datasheet or other publication is applicable to an order at the time the order is placed. All Information given herein is believed to be accurate and reliable, but it is presented without any guarantee, warranty, representation or responsibility of any kind, expressed or implied. Statements of suitability for certain applications are based on the knowledge that the Cornell Dubilier company providing such statements ("Cornell Dubilier") has of operating conditions that such Cornell Dubilier company regards as typical for such applications, but are not intended to constitute any guarantee, warranty or representation regarding any such matter – and Cornell Dubilier specifically and expressly disclaims any guarantee, warranty or representation concerning the suitability for a specific customer application, use, storage, transportation, or operating environment. The Information is intended for use only by customers who have the requisite experience and capability to determine the correct products for their application. Any technical advice inferred from this Information or otherwise provided by Cornell Dubilier with reference to the use of any Cornell Dubilier products is given gratis (unless otherwise specified by Cornell Dubilier), and Cornell Dubilier assumes no obligation or liability for the advice given or results obtained. Although Cornell Dubilier strives to apply the most stringent quality and safety standards regarding the design and manufacturing of its products, in light of the current state of the art, isolated component failures may still occur. Accordingly, customer applications which require a high degree of reliability or safety should employ suitable designs or other safeguards (such as installation of protective circuitry or redundancies or other appropriate protective measures) in order to ensure that the failure of an electrical component does not result in a risk of personal injury or property damage. Although all product-related warnings, cautions and notes must be observed, the customer should not assume that all safety measures are indicated in such warnings, cautions and notes, or that other safety measures may not be required.
