ME2188

High Efficiency, synchronous PFM step-up DC-DC converter

General Description

ME2188 Series is a PFM Step-up DC/DC converter IC with low supply current by CMOS process. High frequency noise that occurs during switching is reduced by using advanced circuit designed, output voltage is programmable in 0.1V steps between 1.9V~5.0V and maximum frequency is 320KHz(TYP.). A low ripple, high efficiency step-up DC/DC converter can be constructed of ME2188 with only two external components. ME2188 is suitable for use with battery-powered instruments with low noise and low supply current.

Features

- High efficiency：93%
- Maximum frequency：320KHz
- Low Quiescent Current：7.5μA
- Input Voltage: 0.9V ~ 5.0V
- Output Voltage Range:1.9V ~ 5.0V
- High Accuracy: ± 2%
- Low ripple and Low noise

Typical Application

- Power source for battery-powered equipment
- Power source for Wireless mouse, toys, Cameras, VCRs, PDAs, MP3, and Led lighting etc
Package

- 5-pin   SOT23-5
- 3-pin   SOT23、SOT23-3、SOT89-3、TO92
Typical Application Circuit

Operation Description

ME2188 step-up DC/DC converter charges energy in the inductor when Lx Transistor is on, and discharges the energy with the addition of the energy from input power source thereto, so that a higher output voltage than the input voltage is obtained. Following is the operation diagram.

Switching DC/DC Step up Converter operating process

PCB Layout：
Set external components as close as possible to the IC and minimize the connection between the components and the IC. In particular, when an external component is connected to VOUT Pin, make minimum connection with the capacitor.

Make Vss pin sufficient grounding, otherwise, the zero level within IC will varied with the switching current. This may result in unstable operation of IC.
