Description

The IDT74SSTUBF32869A is 14-bit 1:2 registered buffer with parity, designed for 1.7 V to 1.9 V V_{DD} operation.

All clock and data inputs are compatible with the JEDEC standard for SSTL_18. The control inputs are LVCMOS. All outputs are 1.8V CMOS drivers optimized to drive the DDR2 DIMM load. They provide 50% more dynamic driver strength than the standard SSTU32864 outputs.

The IDT74SSTUBF32869A operates from a differential clock (CLK and $\overline{CLK}$). Data are registered at the crossing of CLK going high, and $\overline{CLK}$ going low.

The device supports low-power standby operation. When the reset input ($\overline{RESET}$) is low, the differential input receivers are disabled, and undriven (floating) data, clock and reference voltage (V_{REF}) inputs are allowed. In addition, when $\overline{RESET}$ is low all registers are reset, and all outputs except $\overline{PTYERR}$ are forced low. The LVCMOS $\overline{RESET}$ input must always be held at a valid logic high or low level.

To ensure defined outputs from the register before a stable clock has been supplied, $\overline{RESET}$ must be held in the low state during power up.

In the DDR2 RDIMM application, $\overline{RESET}$ is specified to be completely asynchronous with respect to CLK and $\overline{CLK}$. Therefore, no timing relationship can be guaranteed between the two. When entering reset, the register will be cleared and the outputs will be driven low quickly, relative to the time to disable the differential input receivers. However, when coming out of reset, the register will become active quickly, relative to the time to enable the differential input receivers. IDT74SSTUBF32869A must ensure that the outputs remain low as long as the data inputs are low, the clock is stable during the time from the low-to-high transition of $\overline{RESET}$ and the input receivers are fully enabled. This will ensures that there are no glitches on the output.

The device monitors both $\overline{DCS}$ and $\overline{CSR}$ inputs and will gate the Qn, PPO (Paritial-Parity-Out) and $\overline{PTYERR}$ (Parity Error) Parity outputs from changing states when both $\overline{DCS}$ and $\overline{CSR}$ are high. If either $\overline{DCS}$ and $\overline{CSR}$ input is low, the Qn, PPO and $\overline{PTYERR}$ outputs will function normally. The $\overline{RESET}$ input has priority over the $\overline{DCS}$ and $\overline{CSR}$ controls and will force the Qn and PPO outputs low and the $\overline{PTYERR}$ high.

The IDT74SSTUBF32869A includes a parity checking function. The IDT74SSTUBF32869A accepts a parity bit from the memory controller at its input pin PARIN one or two cycles after the corresponding data input, compares it with the data received on the D-inputs and indicates on its opendrain $\overline{PTYERR}$ pin (active low) whether a parity error has occurred. The number of cycles depends on the setting of C1.

When used as a single device, the C1 input is tied low. When used in pairs, the C1 inputs is tied low for the first register (front) and the C1 input is tied high for the second register. When used as a single register, the PPO and $\overline{PTYERR}$ signals are produced two clock cycles after the corresponding data input. When used in pairs, the $\overline{PTYERR}$ signals of the first register are left floating. The PPO outputs of the first register are cascaded to the PARIN signas on the second register (back). The PPO and $\overline{PTYERR}$ signals of the second register are produced three clock cycles after the corresponding data input. Parity implimentation and device wiring for single and dual die is described in the diagram below.

If an error occurs, and the $\overline{PTYERR}$ is driven low, it stays low for two clock cycles or until $\overline{RESET}$ is driven low. The DIMM-dependent signals (DCKE, DCS, CSR and DODT) are not included in the parity check computations.

All registers used on an individual DIMM must be of the same configuration, i.e single or dual die.

Features

- 14-bit 1:2 registered buffer with parity check functionality
- Supports SSTL_18 JEDEC specification on data inputs and outputs
- 50% more dynamic driver strength than standard SSTU32864
- Supports LVCMOS switching levels on C1 and $\overline{RESET}$ inputs
- Low voltage operation: V_{DD} = 1.7V to 1.9V
- Available in 150 BGA package

Applications

- DDR2 Memory Modules
- Provides complete DDR DIMM solution with ICS98ULPA877A or IDTCSPUA877A
- Ideal for DDR2 667 and 800

Terminal Functions

Signal Group	Terminal Name	Type	Description
Ungated Inputs	DCKE, DODT	SSTL_18	DRAM function pins not associated with Chip Select
Chip Select Gated Inputs	D1...D14[1]	SSTL_18	DRAM inputs, re-driven only when Chip Select is LOW
Chip Select Inputs	$\overline{DCS}$, $\overline{CSR}$	SSTL_18	DRAM Chip Select signals. These pins initiate DRAM address/command decodes, and as such at least one will be LOW when a valid address/command is present.
Re-Driven Outputs	Q1A...Q14A[1], Q1B...Q14B[1], $\overline{QCS}$nA, B QCKEnA, B QODTnA, B	SSTL_18	Outputs of the register, valid after the specified clock count and immediately following a rising edge of the clock
Parity Input	PARIN	SSTL_18	Input parity is received on pin PARIN, and should maintain odd parity across the D1:D14 inputs, at the rising edge of the clock, one cycle after Chip Select is LOW.
Parity Output	PPO	SSTL_18	Partial Parity Output. Indicates parity out of D1-D14.
Parity Error Output	$\overline{PTYERR}$	Open Drain	When LOW, this output indicates that a parity error was identified associated with the address and/or command inputs. $\overline{PTYERR}$ will be active for two clock cycles, and delayed by in total two clock cycles for compatibility with final parity out timing on the industry-standard DDR2 register with parity (in JEDEC definition).
Configuration Inputs	C1	SSTL_18	When LOW, the register is configured as Register 1. When HIGH, the register is configured as Register 2.
Clock Inputs	CLK, $\overline{CLK}$	SSTL_18	Differential master clock input pair to the register. The register operation is triggered by a rising edge on the positive clock input (CLK).
Miscellaneous Inputs	$\overline{RESET}$	SSTL_18 Input	Asynchronous Reset Input. When LOW, it causes a reset of the internal latches, thereby forcing the outputs LOW. $\overline{RESET}$ also resets the $\overline{PTYERR}$ signal.
	V_{REF}	0.9V nominal	Input reference voltage for SSTL_18 inputs. Two pins (internally tied together) are used for increased Inputsreliability.
	V_{DD}	Power Input	Power Supply Voltage
	GND	Ground Input	Ground

L	X or Floating	X or Floating	X or Floating	X or Floating	X or Floating	X or Floating	L	H

1 H = HIGH Voltage Level
L = LOW Voltage Level
X = Don't Care
↑ = LOW to HIGH
↓= HIGH to LOW

2 This range does not include D1, D4, and D7.

3 PARIN arrives one clock cycle (C1 = 0), or two clock cycles (C1 = 1), after the data to which it applies.

4 This transition assumes $\overline{\text{PTYERR}}$ is HIGH at the crossing of CLK going HIGH and $\overline{\text{CLK}}$ going LOW. If $\overline{\text{PTYERR}}$ is LOW, it stays latched LOW for two clock cycles or until $\overline{\text{RESET}}$ is driven LOW. PARIN is used to generate PPO and $\overline{\text{PTYERR}}$.

Absolute Maximum Ratings

Stresses greater than those listed under ABSOLUTE MAXIMUM RATINGS may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect reliability.

Item		Rating
Supply Voltage, V_{DD}		-0.5V to 2.5V
Input Voltage Range, V_I[1]		-0.5V to V_{DD} + 2.5V
Output Voltage Range, V_O[1,2]		-0.5V to V_{DDQ} + 0.5V
Input Clamp Current, I_{IK}		±50mA
Output Clamp Current, I_{OK}		±50mA
Continuous Output Clamp Current, I_O		±50mA
Continuous Current through each V_{DD} or GND		±100mA
Package Thermal Impedance (θja)[3]	0m/s Airflow	40° C/W
	1m/s Airflow	29° C/W
Storage Temperature, T_{STG}		-65 to +150° C

1 The input and output negative voltage ratings may be exceeded if the ratings of the I/P and O/P clamp current are observed.
2 This current will flow only when the output is in the high state level $V_O > V_{DDQ}$.
3 The package thermal impedance is calculated in accordance with JESD 51.
