**Notes on Electrical Characteristics (all measurements use 9LRS3187B as clock source and  $R_S=33\text{ohms}/C_L=2\text{pF}$  test load):**

<sup>1</sup>Guaranteed by design and characterization, not 100% tested in production.

<sup>2</sup>Slew rate measured through  $V_{swing}$  centered around differential zero

<sup>3</sup> $V_{xabs}$  is defined as the voltage where  $CLK = CLK\#$

<sup>4</sup>Only applies to the differential rising edge (CLK rising and CLK# falling)

<sup>5</sup>Defined as the total variation of all crossing voltages of CLK rising and CLK# falling. Matching applies to rising edge rate of CLK and falling edge of CLK#. It is measured using a +/-75mV window centered on the average cross point where CLK meets CLK#.

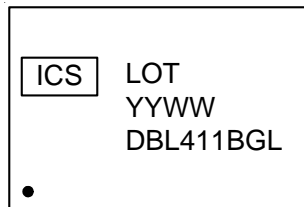

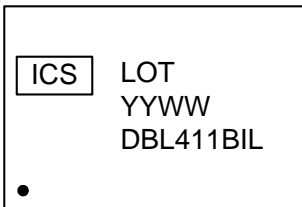

<sup>6</sup>This figure refers to the maximum distortion of the input wave form.

<sup>7</sup>Operation under these conditions is neither implied, nor guaranteed.

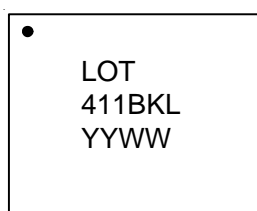

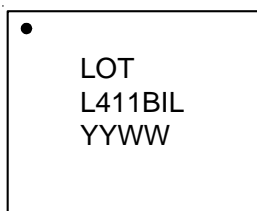

<sup>8</sup>Maximum input voltage is not to exceed maximum VDD

<sup>9</sup>The 9DBL411B has no PLL, so the part itself contributes very little jitter to the input clock. But this also means that the 9DBL411 cannot 'de-jitter' a noisy input clock. Values calculated per PCI SIG and per Intel Clock Jitter tool version 1.5
