

### GENERAL DESCRIPTION

The IDTF1241 (1 dB steps) is an IF VGA for Diversity Basestation receivers. The device offers significantly better Noise and Distortion performance than currently available devices. It is packaged in a compact 5x5 Thin QFN with 200 ohm differential input and output impedances for ease of integration into the receiver lineup.

### COMPETITIVE ADVANTAGE

The IDTF1241 IF VGA improves system Signal-to-Noise Ratio (SNR), especially at lower gain settings. Via IDT's proprietary FlatNoise™ technology both IP<sub>3o</sub> & NF are kept virtually flat while gain is backed off, enhancing SNR significantly under high level interferer conditions, and greatly benefiting 2G/3G/4G Multi-Carrier IF sampling receivers.

The fast-settling gain step of 1 dB coupled with pinpoint accuracy allow for SNR to be maximized further by targeting the minimum necessary gain in small, accurate increments.

See the 'Applications Information' section starting on Page 17 for more details of the benefits of the F1241 in IF sampling receivers.

### FEATURES

- Ideal for systems with high SNR requirements
- 20 dB typical Maximum Gain
- 5-bit, 1 dB step, 31 dB gain control range
- Excellent Noise Figure = 4.0 dB
- 5mm x 5mm 32 pin package
- **200 Ω** Differential Matched Input
- **200 Ω** Differential Matched Output
- No termination resistors required
- NF degrades just 1.3 dB @ 10 dB below Max Gain
- 10 MHz – 500 MHz frequency range
- Ultra-Linear: IP<sub>3o</sub> +48 dBm typical
- Excellent 2<sup>nd</sup> Harmonic Rejection < -80 dBc
- Parallel Control
- External current setting resistors
- Very fast settling < 15 nsec
- Individual Power Down Modes
- Extremely Low Power: 80 mA / Chan

### APPLICATIONS

- Base Station 2G, 3G, 4G, TDD radiocards
- Repeaters and E911 systems
- Digital Pre-Distortion
- Point to Point Infrastructure
- Public Safety Infrastructure
- WIMAX Receivers and Transmitters
- Military Systems, JTRS radios

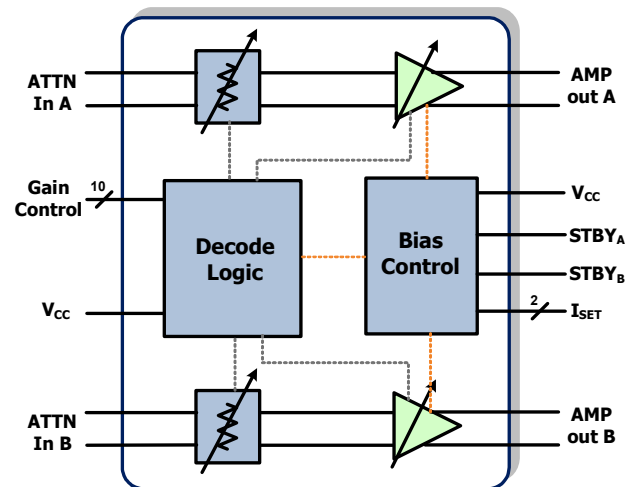

### PART# MATRIX

Part#	Range / Step	IP <sub>3o</sub>	IF freq range	NF	Pinout Compatibility
F1241	20 to -11 1.0	48	10 - 500	4	ADI
F1240	20 to -11.5 0.5	47	10 - 500	4	TI (NSM)

### ORDERING INFORMATION

### DEVICE BLOCK DIAGRAM

**ABSOLUTE MAXIMUM RATINGS**

$V_{CC}$ to GND	-0.3V to +5.5V
GA[5:1], GB[5:1], STBY <sub>A</sub> , STBY <sub>B</sub>	-0.3V to ( $V_{CC\_} + 0.25V$ )
OUT_A-, OUT_A+, OUT_B-, OUT_B+	-0.3V to ( $V_{CC\_} + 0.25V$ )
IN_A-, IN_A+, IN_B-, IN_B+	-0.3V to +2.2V
ISET_A, ISET_B to GND	-0.3V to +2.2V
RF Input Power (IN_A-, IN_A+, IN_B-, IN_B+) @ $G_{MAX}$	+15 dBm
Continuous Power Dissipation	1.5W
$\theta_{JA}$ (Junction – Ambient)	+40°C/W
$\theta_{JC}$ (Junction – Case) The Case is defined as the exposed paddle	+3°C/W
Operating Temperature Range (Case Temperature)	$T_C = -40^{\circ}C$ to +100°C
Maximum Junction Temperature	150°C
Storage Temperature Range	-65°C to +150°C
Lead Temperature (soldering, 10s) .	+260°C

Stresses above those listed above may cause permanent damage to the device. Functional operation of the device at these or any other conditions above those indicated in the operational section of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

**ESD Caution**

This product features proprietary protection circuitry. However, it may be damaged if subjected to high energy ESD. Please use proper ESD precautions when handling to avoid damage or loss of performance.

**APPLICATIONS INFORMATION**

The F1241 has been optimized for use in high performance IF sub-sampling applications. It has unique features that make it ideal for these very demanding applications.

**Noise Contour**

The remarkable FlatNoise™ feature of the device (see first four graphs on page 10) has great benefits when implemented in wideband multi-carrier systems. For the first 13 dB of attenuation range, the device has only 2.3 dB degradation in noise figure. This is in stark contrast to standard VGAs that have a linear dB-for-dB degradation in Noise Figure with increasing attenuation.

Refer to the figure below. It depicts the F1241 driving a matched Anti-Alias Filter which is followed by an ADC with a differential resistive 200 ohm termination. Note that at each point in the system the matching is preserved.

A discrete realization of a 3<sup>rd</sup> order Anti-Alias filter is shown on the next page. Sampling occurs in Nyquist Zone3 for a 60 MHz multi-carrier signal. Noise just 20 MHz above & below the signal bandedges will alias from either Zone4 or Zone2 and show up as added noise in the desired band at the digital output of the ADC.

**APPLICATIONS INFORMATION (CONT.)**
**Noise Contour (cont.)**

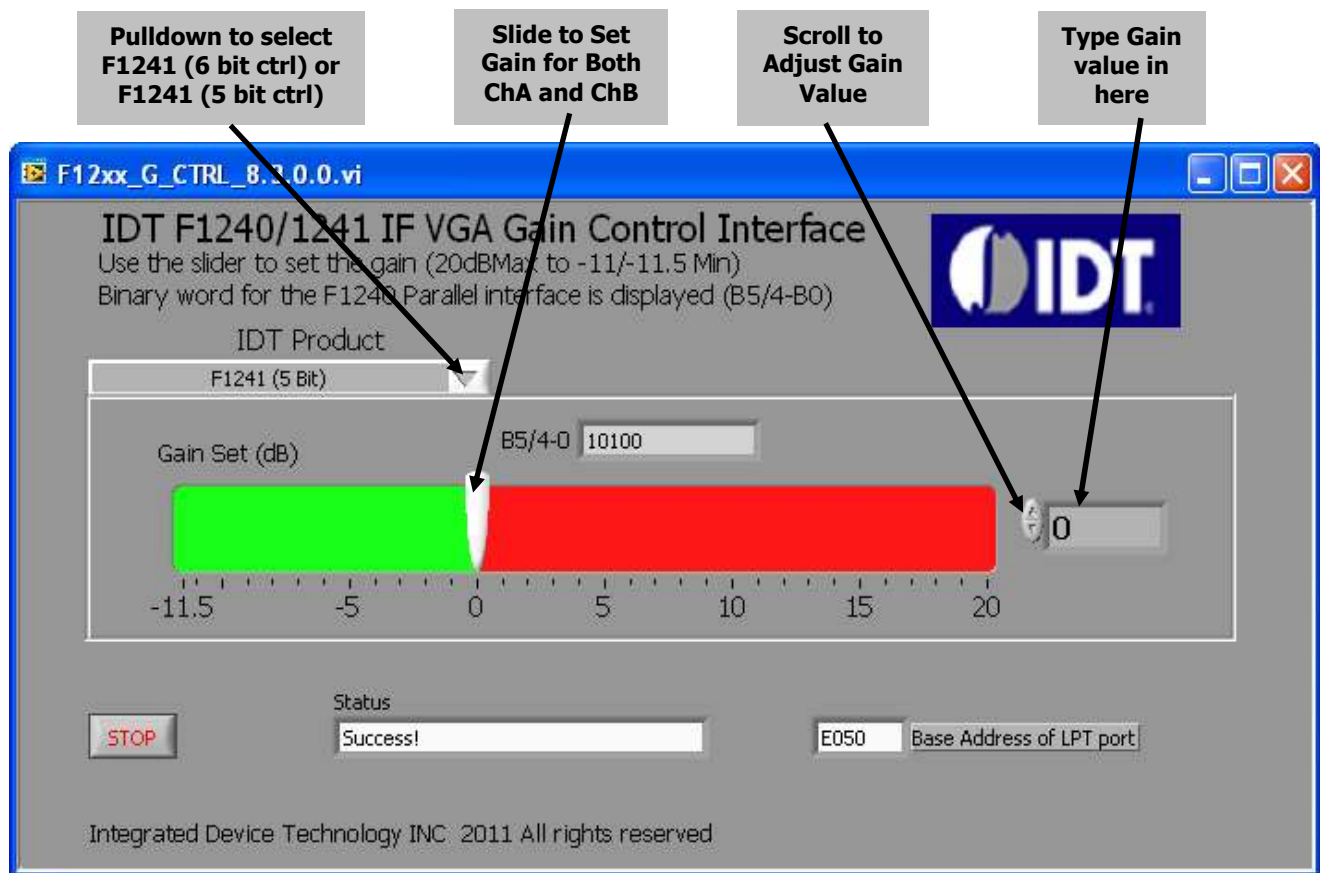

The result is that the F1241 with its unique noise contour will improve SNR significantly in this multi-carrier instance. Note in the graph below: SNR improves over 2 dB at high attenuation settings which allows for the use of a lower cost / lower resolution ADC in the Rx path. Alternately, F1241 FlatNoise™ coupled with its excellent H2, IM2, and H3 performance allows simplification or even elimination of the Anti-Alias Filter.

**APPLICATIONS INFORMATION (CONT.)**
**Other Key Features:**

**Current Setting Resistors** – The IDTF1241 already offers the best IM3 distortion performance over the widest Power range when driving a matched load w/ 160 mA Total  $I_{CC}$ . The user has the option to reduce  $I_{CC}$  even further at the expense of Output IP3. See the graph at Middle Right on Page 10 for details. Note that ChA and ChB  $I_{CC}$  can be independently set.

**Settling Time** – The IDTF1241 has been designed as Glitch-Free™ when changing gain between **ANY** adjacent steps. Note the two graphs at the bottom of Page 10. Even for 1 dB steps that involve **MSB transitions** the settling time is still <15 nsec.

**Gain Controller Software**

**Pulldown to select F1241 (6 bit ctrl) or F1241 (5 bit ctrl)**

**Slide to Set Gain for Both ChA and ChB**

**Contact your IDT Sales Professional or Email: [RFsupport@IDT.com](mailto:RFsupport@IDT.com) to request applications support**

**APPLICATIONS INFORMATION (CONT.)**
**Operation into a 100 ohm load**

The F1241 can be dropped directly into a 100 ohm termination environment without any topology changes, so no board redesign is necessary. The example schematic below is for a 153 MHz IF center frequency. Simply replace the pullup inductors already on the board with 91 nH and replace the series AC coupling capacitors already on the board with 18 pF. The F1241 in this case will then drive a 100 ohm filter with ~16 dB return loss. See schematic and measured results when matched to 100 ohms below:
