# microPower, Rail-to-Rail Operational Amplifiers 

## FEATURES

- LOW I ${ }_{\mathrm{Q}}: 20 \mu \mathrm{~A}$
- microSIZE PACKAGES: WCSP-8, SC70-5

SOT23-5, SOT23-8, and TSSOP-14

- HIGH SPEED/POWER RATIO WITH BANDWIDTH: 350 kHz
- RAIL-TO-RAIL INPUT AND OUTPUT
- SINGLE SUPPLY: 2.3V to 5.5 V

## APPLICATIONS

- PORTABLE EQUIPMENT
- BATTERY-POWERED EQUIPMENT
- 2-WIRE TRANSMITTERS
- SMOKE DETECTORS
- CO DETECTORS

## DESCRIPTION

The OPA347 is a microPower, low-cost operational amplifier available in micropackages. The OPA347 (single version) is available in the SC-70 and SOT23-5 packages. The OPA2347 (dual version) is available in the SOT23-8 and WCSP-8 packages. Both are also available in the SO-8. The OPA347 is also available in the DIP-8. The OPA4347 (quad) is available in the SO-14 and the TSSOP-14.

The small size and low power consumption ( $34 \mu \mathrm{~A}$ per channel maximum) of the OPA347 make it ideal for portable and battery-powered applications. The input range of the OPA347 extends 200 mV beyond the rails, and the output range is within 5 mV of the rails. The OPA347 also features an excellent speed/power ratio with a bandwidth of 350 kHz .
The OPA347 can be operated with a single or dual power supply from 2.3 V to 5.5 V . All models are specified for operation from $-55^{\circ} \mathrm{C}$ to $+125^{\circ} \mathrm{C}$.

All trademarks are the property of their respective owners.

## ABSOLUTE MAXIMUM RATINGS ${ }^{(1)}$

| Signal Input Terminals, Voltage ${ }^{(2)}$ $\qquad$ $(\mathrm{V}-)-0.5 \mathrm{~V}$ to $(\mathrm{V}+)+0.5 \mathrm{~V}$ Current ${ }^{(2)}$ $\qquad$ 10 mA |  |
| :---: | :---: |
|  |  |
| Output Short-Circuit ${ }^{(3)}$ | Continuous |
| Operating Temperature | $65^{\circ} \mathrm{C}$ to $+150^{\circ} \mathrm{C}$ |
| Storage Temperature | $-65^{\circ} \mathrm{C}$ to $+150^{\circ} \mathrm{C}$ |
| Junction Temperature | .... $150^{\circ} \mathrm{C}$ |

NOTES: (1) Stresses above these ratings may cause permanent damage. Exposure to absolute maximum conditions for extended periods may degrade device reliability. These are stress ratings only. Functional operation of the device at these conditions, or beyond the specified operating conditions, is not implied. (2) Input terminals are diode-clamped to the power-supply rails. Input signals that can swing more than 0.5 V beyond the supply rails should be current-limited to 10 mA or less. (3) Short-circuit to ground, one amplifier per package.

## ELECTROSTATIC DISCHARGE SENSITIVITY

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.
ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

## APPLICATIONS INFORMATION

The OPA347 series op amps are unity-gain stable and can operate on a single supply, making them highly versatile and easy to use.

Rail-to-rail input and output swing significantly increases dynamic range, especially in low supply applications. Figure 1 shows the input and output waveforms for the OPA347 in unity-gain configuration. Operation is from $\mathrm{V}_{\mathrm{S}}=+5 \mathrm{~V}$ with a $100 \mathrm{k} \Omega$ load connected to $\mathrm{V}_{\mathrm{S}} / 2$. The input is a $5 \mathrm{~V}_{\mathrm{Pp}}$ sinusoid. Output voltage is approximately $4.995 \mathrm{~V}_{\mathrm{PP}}$.

Power-supply pins should be bypassed with $0.01 \mu \mathrm{~F}$ ceramic capacitors.

## OPERATING VOLTAGE

The OPA347 series op amps are fully specified and ensured from 2.5 V to 5.5 V . In addition, many specifications apply from $-55^{\circ} \mathrm{C}$ to $+125^{\circ} \mathrm{C}$. Parameters that vary significantly with operating voltages or temperature are shown in the Typical Characteristics.

## RAIL-TO-RAIL INPUT

The input common-mode voltage range of the OPA347 series extends 200 mV beyond the supply rails. This is achieved with a complementary input stage-an N-channel input differential pair in parallel with a P-channel differential pair, as shown in Figure 2. The N -channel pair is active for input voltages close to the positive rail, typically $\left(\mathrm{V}_{+}\right)-1.3 \mathrm{~V}$ to 200 mV above the positive supply, while the P -channel pair is on for inputs from 200 mV below the negative supply to approximately $(\mathrm{V}+)-1.3 \mathrm{~V}$. There is a small transition region, typically $(\mathrm{V}+)-1.5 \mathrm{~V}$ to $(\mathrm{V}+)-1.1 \mathrm{~V}$, in which both pairs are on. This 400 mV transition region can vary 300 mV with process variation. Thus, the transition region (both stages on) can range from $\left(\mathrm{V}_{+}\right)-1.65 \mathrm{~V}$ to $(\mathrm{V}+)-1.25 \mathrm{~V}$ on the low end, up to $(\mathrm{V}+)-1.35 \mathrm{~V}$ to $(\mathrm{V}+)-0.95 \mathrm{~V}$ on the high end. Within the 400 mV transition region PSRR, CMRR, offset voltage, and offset drift may be degraded compared to operation outside this region. For more information on designing with rail-to-rail input op amps, see Figure 3, Design Optimization with Rail-to-Rail Input Op Amps.

FIGURE 1. Rail-to-Rail Input and Output.

FIGURE 2. Simplified Schematic.

## DESIGN OPTIMIZATION WITH RAIL-TO-RAIL INPUT OP AMPS

Rail-to-rail op amps can be used in virtually any op amp configuration. To achieve optimum performance, however, applications using these special double-input-stage op amps may benefit from consideration of their special behavior.
In many applications, operation remains within the com-mon-mode range of only one differential input pair. However, some applications exercise the amplifier through the transition region of both differential input stages. A small discontinuity may occur in this transition. Careful selection of the circuit configuration, signal levels, and biasing can often avoid this transition region.

With a unity-gain buffer, for example, signals will traverse this transition at approximately 1.3 V below the $\mathrm{V}+$ supply and may exhibit a small discontinuity at this point.
The common-mode voltage of the noninverting amplifier is equal to the input voltage. If the input signal always remains less than the transition voltage, no discontinuity will be created. The closed-loop gain of this configuration can still produce a rail-to-rail output.
Inverting amplifiers have a constant common-mode voltage equal to $V_{B}$. If this bias voltage is constant, no discontinuity will be created. The bias voltage can generally be chosen to avoid the transition region.

FIGURE 3. Design Optimization with Rail-to-Rail Input Op Amps.

## COMMON-MODE REJECTION

The CMRR for the OPA347 is specified in several ways so the best match for a given application may be used. First, the CMRR of the device in the common-mode range below the transition region $\left(\mathrm{V}_{\mathrm{CM}}<(\mathrm{V}+)-1.7 \mathrm{~V}\right)$ is given. This specification is the best indicator of the capability of the device when the application requires use of one of the differential input pairs. Second, the CMRR at $\mathrm{V}_{\mathrm{S}}=5.5 \mathrm{~V}$ over the entire common-mode range is specified.

## INPUT VOLTAGE

The input common-mode range extends from ( $\mathrm{V}-$ ) -0.2 V to $(\mathrm{V}+)+0.2 \mathrm{~V}$. For normal operation, inputs should be limited to this range. The absolute maximum input voltage is 500 mV beyond the supplies. Inputs greater than the input common-mode range but less than the maximum input voltage, while not valid, will not cause any damage to the op amp. Furthermore, if input current is limited the inputs may go beyond the power supplies without phase inversion, as shown in Figure 4, unlike some other op amps.
Normally, input currents are $0.4 p A$. However, large inputs (greater than 500 mV beyond the supply rails) can cause excessive current to flow in or out of the input pins. Therefore, as well as keeping the input voltage below the maximum rating, it is also important to limit the input current to less than 10 mA . This is easily accomplished with an input resistor, as shown in Figure 5.

FIGURE 4. OPA347-No Phase Inversion with Inputs Greater than the Power-Supply Voltage.

FIGURE 5. Input Current Protection for Voltages Exceeding the Supply Voltage.

## RAIL-TO-RAIL OUTPUT

A class AB output stage with common-source transistors is used to achieve rail-to-rail output. This output stage is capable of driving $5 \mathrm{k} \Omega$ loads connected to any potential between $\mathrm{V}+$ and ground. For light resistive loads ( $>100 \mathrm{k} \Omega$ ), the output voltage can typically swing to within 5 mV from supply rail. With moderate resistive loads ( $10 \mathrm{k} \Omega$ to $50 \mathrm{k} \Omega$ ), the output can swing to within a few tens of millivolts from the supply rails while maintaining high open-loop gain (see the typical characteristic Output Voltage Swing vs Output Current).

## CAPACITIVE LOAD AND STABILITY

The OPA347 in a unity-gain configuration can directly drive up to 250 pF pure capacitive load. Increasing the gain enhances the amplifier's ability to drive greater capacitive loads (see the characteristic curve Small-Signal Overshoot vs Capacitive Load). In unity-gain configurations, capacitive load drive can be improved by inserting a small ( $10 \Omega$ to $20 \Omega$ ) resistor, $\mathrm{R}_{\mathrm{S}}$, in series with the output, as shown in Figure 6. This significantly reduces ringing while maintaining Direct Current (DC) performance for purely capacitive loads. However, if there is a resistive load in parallel with the capacitive load, a voltage divider is created, introducing a DC error at the output and slightly reducing the output swing. The error introduced is proportional to the ratio $R_{S} / R_{L}$, and is generally negligible.

FIGURE 6. Series Resistor in Unity-Gain Buffer Configuration Improves Capacitive Load Drive.

In unity-gain inverter configuration, phase margin can be reduced by the reaction between the capacitance at the op amp input, and the gain setting resistors, thus degrading capacitive load drive. Best performance is achieved by using small valued resistors. For example, when driving a 500 pF
load, reducing the resistor values from $100 \mathrm{k} \Omega$ to $5 \mathrm{k} \Omega$ decreases overshoot from $40 \%$ to $8 \%$ (see the characteristic curve Small-Signal Overshoot vs Load Capacitance). However, when large-valued resistors can not be avoided, a small ( 4 pF to 6 pF ) capacitor, $\mathrm{C}_{\mathrm{FB}}$, can be inserted in the feedback, as shown in Figure 7. This significantly reduces overshoot by compensating the effect of capacitance, $\mathrm{C}_{\mathbb{N}}$, which includes the amplifier input capacitance and PC board parasitic capacitance.

FIGURE 7. Adding a Feedback Capacitor In the Unity-Gain Inverter Configuration Improves Capacitative Load.

## DRIVING ADCs

The OPA347 series op amps are optimized for driving medium-speed sampling Analog-to-Digital Converters (ADCs). The OPA347 op amps buffer the ADC's input capacitance and resulting charge injection while providing signal gain.
See Figure 8 for the OPA347 in a basic noninverting configuration driving the ADS7822. The ADS7822 is a 12-bit, microPower sampling converter in the MSOP-8 package. When used with the low-power, miniature packages of the OPA347, the combination is ideal for space-limited, lowpower applications. In this configuration, an RC network at the ADC input can be used to provide for anti-aliasing filter and charge injection current.
See Figure 9 for the OPA2347 driving an ADS7822 in a speech bandpass filtered data acquisition system. This small, low-cost solution provides the necessary amplification and signal conditioning to interface directly with an electret microphone. This circuit will operate with $\mathrm{V}_{\mathrm{S}}=2.7 \mathrm{~V}$ to 5 V with less than $250 \mu \mathrm{~A}$ typical quiescent current.

FIGURE 8. OPA347 in Noninverting Configuration Driving ADS7822.

FIGURE 9. Speech Bandpass Filtered Data Acquisition System.

## OPA2347 WCSP PACKAGE

The OPA2347YED and OPA2347YZDR are die-level packages using bump-on-pad technology. The OPA2347YED device has tin-lead balls; the OPA2347YZDR has lead-free balls. Unlike devices that are in plastic packages, these devices have no molding compound, lead frame, wire bonds, or leads. Using standard surface-mount assembly procedures, the WCSP can be mounted to a printed circuit board without additional under fill. Figures 10 and 11 detail pinout and package marking.

FIGURE 10. Pin Description.

FIGURE 11. Top View Package Marking.

## PHOTOSENSITIVITY

Although the OPA2347YED/YZD package has a protective backside coating that reduces the amount of light exposure on the die, unless fully shielded, ambient light will still reach the active region of the device. Input bias current for the OPA2347YED/YZD package is specified in the absence of light. Depending on the amount of light exposure in a given application, an increase in bias current, and possible increases in offset voltage should be expected. In circuit board tests under ambient light conditions, a typical increase in bias current reached 100pA. Flourescent lighting may introduce noise or hum due to their time varying light output. Best practice should include end-product packaging that provides shielding from possible light souces during operation.

## RELIABILITY TESTING

To ensure reliability, the OPA2347YED and OPA2347YZDR devices have been verified to successfully pass a series of reliability stress tests. A summary of JEDEC standard reliability tests is shown in Table I.

| TEST | CONDITION | ACCEPT CRITERIA (ACTUAL) | SAMPLE SIZE |
| :---: | :---: | :---: | :---: |
| Temperature Cycle | $-40^{\circ} \mathrm{C}$ to $125^{\circ} \mathrm{C}, 1 \mathrm{Cycle} / \mathrm{hr}, 15$ Minute Ramp ${ }^{(1)}$ 10 Minute Dwell | 500 (1600) Cycles, $\mathrm{R}<1.2 \mathrm{X}$ from $\mathrm{R}_{0}$ | 36 |
| Drop | 50 cm | 10 (129) Drops, $\mathrm{R}<1.2 \mathrm{X}$ from $\mathrm{R}_{0}$ | 8 |
| Key Push | 100 Cycles/min, <br> $1300 \mu \varepsilon$, Displacement $=2.7 \mathrm{~mm}$ Max | $5 \mathrm{~K}\left(6.23 \mathrm{~K}\right.$ ) Cycles, $\mathrm{R}<1.2 \mathrm{X}$ from $\mathrm{R}_{0}$ | 8 |

| NOTE: (1) Per IPC9701. |  |  |  |

TABLE I. Reliability Test Results.

## LAND PATTERNS AND ASSEMBLY

The recommended land pattern for the OPA2347YED package is detailed in Figure 12 with specifications listed in Table II. The maximum amount of force during assembly should be limited to 30 grams of force per bump.

FIGURE 12. Recommended Land Area.

| SOLDER PAD <br> DEFINITION | COPPER PAD | SOLDER MASK <br> OPENING | COPPER <br> THICKNESS | STENCIL OPENING | STENCIL THICKNESS |
| :---: | :---: | :---: | :---: | :---: | :---: |
| Non-Solder Mask <br> Defined (NSMD) | $275 \mu \mathrm{~m}$ <br> $(+0.0,-25 \mu \mathrm{~m})$ | $375 \mu \mathrm{~m}$ <br> $(+0.0,-25 \mu \mathrm{~m})$ | 1 oz max | $275 \mu \mathrm{~m} \times 275 \mu \mathrm{~m}, \mathrm{sq}$ | $125 \mu \mathrm{~m}$ Thick |

NOTES: (1) Circuit traces from NSMD-defined PWB lands should be less tham $100 \mu \mathrm{~m}$ (preferrably $=75 \mu \mathrm{~m}$ ) wide in the exposed area inside the solder mask opening. Wider trace widths will reduce device stand off and impact reliability. (2) Recommended solder paste is type 3 or type 4. (3) Best reliability results are achieved when the PWB laminate glass transistion temperature is above the operating range of the intended application. (4) For PWB using an Ni/Au surface finish, the gold thickness should be less than 0.5 um to avoid solder embrittlement and a reduction in thermal fatigue performance. (5) Solder mask thickness should be less than 20um on top of the copper circuit pattern. (6) Best solder stencil performance will be achieved using laser-cut stencils with electro polishing. Use of chemically etched stencils results in inferior solder paste volume control. (7) Trace routing away from the WLCSP device should be balanced in X and Y directions to avoid unintentional component movement due to solder wetting forces.

${ }^{(1)}$ The marketing status values are defined as follows:
ACTIVE: Product device recommended for new designs.
LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.
NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.
PREVIEW: Device has been announced but is not in production. Samples may or may not be available.
OBSOLETE: TI has discontinued the production of the device.
${ }^{(2)}$ RoHS: TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed $0.1 \%$ by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. Tl may reference these types of products as "Pb-Free"
RoHS Exempt: TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption
Green: TI defines "Green" to mean the content of Chlorine (CI) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.
${ }^{(3)}$ MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.
${ }^{(4)}$ There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.
${ }^{(5)}$ Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.
${ }^{(6)}$ Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

Important Information and Disclaimer:The information provided on this page represents Tl's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and
continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

## TAPE AND REEL INFORMATION

TAPE DIMENSIONS

QUADRANT ASSIGNMENTS FOR PIN 1 ORIENTATION IN TAPE

DCN (R-PDSO-G8)
PLASTIC SMALL-OUTLINE PACKAGE (DIE DOWN)

NOTES: A. All linear dimensions are in millimeters.
B. This drawing is subject to change without notice.
C. Package outline exclusive of metal burr \& dambar protrusion/intrusion.
D. Package outline inclusive of solder plating.
E. A visual index feature must be located within the Pin 1 index area.
F. Falls within JEDEC M0-178 Variation BA.
G. Body dimensions do not include flash or protrusion. Mold flash and protrusion shall not exceed 0.25 per side.

DCN (R-PDSO-G8)
PLASTIC SMALL-OUTLINE PACKAGE (DIE DOWN)

NOTES: A. All linear dimensions are in millimeters.
B. This drawing is subject to change without notice.
C. Publication IPC-7351 is recommended for alternate designs.
D. Laser cutting apertures with trapezoidal walls and also rounding corners will offer better paste release. Customers should contact their board assembly site for stencil design recommendations. Refer to IPC-7525.
E. Customers should contact their board fabrication site for solder mask tolerances between and around signal pads.

NOTES:

1. All linear dimensions are in millimeters. Any dimensions in parenthesis are for reference only. Dimensioning and tolerancing per ASME Y14.5M.
2. This drawing is subject to change without notice.
3. Refernce JEDEC MO-178.
4. Body dimensions do not include mold flash, protrusions, or gate burrs. Mold flash, protrusions, or gate burrs shall not exceed 0.15 mm per side.

SOLDER MASK DETAILS

NOTES: (continued)
5. Publication IPC-7351 may have alternate designs.
6. Solder mask tolerances between and around signal pads can vary based on board fabrication site.

SOLDER PASTE EXAMPLE
BASED ON 0.125 mm THICK STENCIL
SCALE:15X

NOTES: (continued)
7. Laser cutting apertures with trapezoidal walls and rounded corners may offer better paste release. IPC-7525 may have alternate design recommendations.
8. Board assembly site may have different recommendations for stencil design.

D: $\operatorname{Max}=2.092 \mathrm{~mm}, \operatorname{Min}=2.031 \mathrm{~mm}$
$\mathrm{E}: \operatorname{Max}=0.999 \mathrm{~mm}, \mathrm{Min}=0.938 \mathrm{~mm}$

NOTES:

1. All linear dimensions are in millimeters. Any dimensions in parenthesis are for reference only. Dimensioning and tolerancing per ASME Y14.5M.
2. This drawing is subject to change without notice.

NOTES: (continued)
3. Final dimensions may vary due to manufacturing tolerance considerations and also routing constraints.

See Texas Instruments Literature No. SNVA009 (www.ti.com/lit/snva009).

SOLDER PASTE EXAMPLE BASED ON 0.1 mm THICK STENCIL SCALE: 30X

NOTES: (continued)
4. Laser cutting apertures with trapezoidal walls and rounded corners may offer better paste release.

D (R-PDSO-G14)
PLASTIC SMALL OUTLINE

NOTES: A. All linear dimensions are in inches (millimeters).
B. This drawing is subject to change without notice.

C Body length does not include mold flash, protrusions, or gate burrs. Mold flash, protrusions, or gate burrs shall not exceed $0.006(0,15)$ each side.
(D) Body width does not include interlead flash. Interlead flash shall not exceed $0.017(0,43)$ each side.
E. Reference JEDEC MS-012 variation AB.

D (R-PDSO-G14)

NOTES: A. All linear dimensions are in millimeters.
B. This drawing is subject to change without notice.
C. Publication IPC-7351 is recommended for alternate designs.
D. Laser cutting apertures with trapezoidal walls and also rounding corners will offer better paste release. Customers should contact their board assembly site for stencil design recommendations. Refer to IPC-7525 for other stencil recommendations.
E. Customers should contact their board fabrication site for solder mask tolerances between and around signal pads.

NOTES: A. All linear dimensions are in millimeters. Dimensioning and tolerancing per ASME Y14.5M-1994.
B. This drawing is subject to change without notice.

Body length does not include mold flash, protrusions, or gate burrs. Mold flash, protrusions, or gate burrs shall not exceed 0,15 each side.
(D) Body width does not include interlead flash. Interlead flash shall not exceed 0,25 each side.
E. Falls within JEDEC MO-153

NOTES: A. All linear dimensions are in millimeters.
B. This drawing is subject to change without notice.
C. Publication IPC-7351 is recommended for alternate designs.
D. Laser cutting apertures with trapezoidal walls and also rounding corners will offer better paste release. Customers should contact their board assembly site for stencil design recommendations. Refer to IPC-7525 for other stencil recommendations.
E. Customers should contact their board fabrication site for solder mask tolerances between and around signal pads.

NOTES:

1. Linear dimensions are in inches [millimeters]. Dimensions in parenthesis are for reference only. Controlling dimensions are in inches. Dimensioning and tolerancing per ASME Y14.5M.
2. This drawing is subject to change without notice.
3. This dimension does not include mold flash, protrusions, or gate burrs. Mold flash, protrusions, or gate burrs shall not exceed . 006 [0.15] per side.
4. This dimension does not include interlead flash.
5. Reference JEDEC registration MS-012, variation AA.

SOLDER MASK DETAILS

NOTES: (continued)
6. Publication IPC-7351 may have alternate designs.
7. Solder mask tolerances between and around signal pads can vary based on board fabrication site.

NOTES: (continued)
8. Laser cutting apertures with trapezoidal walls and rounded corners may offer better paste release. IPC-7525 may have alternate design recommendations.
9. Board assembly site may have different recommendations for stencil design.
$P(R-P D I P-T 8)$
PLASTIC DUAL-IN-LINE PACKAGE

NOTES: A. All linear dimensions are in inches (millimeters).
B. This drawing is subject to change without notice.
C. Falls within JEDEC MS-001 variation BA.

DCK (R-PDSO-G5)

## PLASTIC SMALL-OUTLINE PACKAGE

NOTES: A. All linear dimensions are in millimeters.
B. This drawing is subject to change without notice.
C. Body dimensions do not include mold flash or protrusion. Mold flash and protrusion shall not exceed 0.15 per side.
D. Falls within JEDEC MO-203 variation AA.

DCK (R-PDSO-G5)

NOTES: A. All linear dimensions are in millimeters.
B. This drawing is subject to change without notice.
C. Customers should place a note on the circuit board fabrication drawing not to alter the center solder mask defined pad.
D. Publication IPC-7351 is recommended for alternate designs.
E. Laser cutting apertures with trapezoidal walls and also rounding corners will offer better paste release. Customers should contact their board assembly site for stencil design recommendations. Example stencil design based on a $50 \%$ volumetric metal load solder paste. Refer to IPC-7525 for other stencil recommendations.
