

**Please note that Cypress is an Infineon Technologies Company.**

The document following this cover page is marked as “Cypress” document as this is the company that originally developed the product. Please note that Infineon will continue to offer the product to new and existing customers as part of the Infineon product portfolio.

**Continuity of document content**

The fact that Infineon offers the following product as part of the Infineon product portfolio does not lead to any changes to this document. Future revisions will occur when appropriate, and any changes will be set out on the document history page.

**Continuity of ordering part numbers**

Infineon continues to support existing part numbers. Please continue to use the ordering part numbers listed in the datasheet for ordering.

# F<sup>2</sup>MC-16FX 16-bit Proprietary Microcontroller

CY96310 series is based on Cypress advanced 16FX architecture (16-bit with instruction pipeline for RISC-like performance). The CPU uses the same instruction set as the established 16LX series - thus allowing for easy migration of 16LX Software to the new 16FX products. 16FX improvements compared to the previous generation include significantly improved performance - even at the same operation frequency, reduced power consumption and faster start-up time.

For highest processing speed at optimized power consumption an internal PLL can be selected to supply the CPU with up to 56MHz operation frequency from an external 4MHz resonator. The result is a minimum instruction cycle time of 17.8ns going together with excellent EMI behavior. An on-chip clock modulation circuit significantly reduces emission peaks in the frequency spectrum. The emitted power is minimized by the on-chip voltage regulator that reduces the internal CPU voltage. A flexible clock tree allows to select suitable operation frequencies for peripheral resources independent of the CPU speed.

## Features

### Technology

- 0.18µm CMOS

### CPU

- F<sup>2</sup>MC-16FX CPU
- Up to 56 MHz internal, 17.8 ns instruction cycle time
- Optimized instruction set for controller applications (bit, byte, word and long-word data types; 23 different addressing modes; barrel shift; variety of pointers)
- 8-byte instruction execution queue
- Signed multiply (16-bit × 16-bit) and divide (32-bit/16-bit) instructions available

### System clock

- On-chip PLL clock multiplier (x1 - x25, x1 when PLL stop)
- 3 MHz - 16 MHz external crystal oscillator clock (maximum frequency when using ceramic resonator depends on Q-factor).
- Up to 56 MHz external clock
- 32-100 kHz subsystem quartz clock
- 100kHz/2MHz internal RC clock for quick and safe startup, oscillator stop detection, watchdog
- Clock source selectable from main- and subclock oscillator (part number suffix "W") and on-chip RC oscillator, independently for CPU and 2 clock domains of peripherals.
- Low Power Consumption - 13 operating modes: (different Run, Sleep, Timer modes, Stop mode)
- Clock modulator

### On-chip voltage regulator

- Internal voltage regulator supports reduced internal MCU voltage, offering low EMI and low power consumption figures

### Low voltage reset

- Reset is generated when supply voltage is below minimum.

### Code Security

- Protects ROM content from unintended read-out

### Memory Patch Function

- Replaces ROM content
- Can also be used to implement embedded debug support

### DMA

- Automatic transfer function independent of CPU, can be assigned freely to resources

### Interrupts

- Fast Interrupt processing
- 8 programmable priority levels
- Non-Maskable Interrupt (NMI)

### Timers

- Three independent clock timers (23-bit RC clock timer, 23-bit Main clock timer, 17-bit Sub clock timer)
- Watchdog Timer

### CAN

- Supports CAN protocol version 2.0 part A and B
- ISO16845 certified
- Bit rates up to 1 Mbit/s
- 32 message objects
- Each message object has its own identifier mask
- Programmable FIFO mode (concatenation of message objects)
- Maskable interrupt
- Disabled Automatic Retransmission mode for Time Triggered CAN applications
- Programmable loop-back mode for self-test operation

## USART

- Full duplex USARTs (SCI/LIN)
- Wide range of baud rate settings using a dedicated reload timer
- Special synchronous options for adapting to different synchronous serial protocols
- LIN functionality working either as master or slave LIN device

## A/D converter

- SAR-type
- 10-bit resolution
- Signals interrupt on conversion end, single conversion mode, continuous conversion mode, stop conversion mode, activation by software, external trigger or reload timer

## Reload Timers

- 16-bit wide
- Prescaler with  $1/2^1$ ,  $1/2^2$ ,  $1/2^3$ ,  $1/2^4$ ,  $1/2^5$ ,  $1/2^6$  of peripheral clock frequency
- Event count function

## Free Running Timers

- Signals an interrupt on overflow, supports timer clear upon match with Output Compare (0, 4), Prescaler with 1,  $1/2^1$ ,  $1/2^2$ ,  $1/2^3$ ,  $1/2^4$ ,  $1/2^5$ ,  $1/2^6$ ,  $1/2^7$ ,  $1/2^8$  of peripheral clock frequency

## Input Capture Units

- 16-bit wide
- Signals an interrupt upon external event
- Rising edge, falling edge or rising & falling edge sensitive

## Output Compare Units

- 16-bit wide
- Signals an interrupt when a match with 16-bit I/O Timer occurs
- A pair of compare registers can be used to generate an output signal.

## Programmable Pulse Generator

- 16-bit down counter, cycle and duty setting registers
- Interrupt at trigger, counter borrow and/or duty match
- PWM operation and one-shot operation
- Internal prescaler allows 1, 1/4, 1/16, 1/64 of peripheral clock as counter clock and Reload timer underflow as clock input
- Can be triggered by software or reload timer

## Real Time Clock

- Can be clocked either from sub oscillator (devices with part number suffix "W"), main oscillator or from the RC oscillator
- Facility to correct oscillation deviation of Sub clock or RC oscillator clock (clock calibration)
- Read/write accessible second/minute/hour registers
- Can signal interrupts every half second/second/minute/hour/day
- Internal clock divider and prescaler provide exact 1s clock

## External Interrupts

- Edge sensitive or level sensitive
- Interrupt mask and pending bit per channel
- Each available CAN channel RX has an external interrupt for wake-up
- Selected USART channels SIN have an external interrupt for wake-up

## Non Maskable Interrupt

- Disabled after reset
- Once enabled, can not be disabled other than by reset.
- Level high or level low sensitive
- Pin shared with external interrupt 0.

## I/O Ports

- Virtually all external pins can be used as general purpose I/O
- All push-pull outputs
- Bit-wise programmable as input/output or peripheral signal
- Bit-wise programmable input enable
- Bit-wise programmable input levels: Automotive / CMOS-Schmitt trigger / TTL
- Bit-wise programmable pull-up resistor
- Bit-wise programmable output driving strength for EMI optimization

## Packages

- 48-pin plastic LQFP M26

**Flash Memory**

- Supports automatic programming, Embedded Algorithm
- Write/Erase/Erase-Suspend/Resume commands
- A flag indicating completion of the algorithm
- Number of erase cycles: 10,000 times
- Data retention time: 20 years
- Erase can be performed on each sector individually
- Sector protection
- Flash Security feature to protect the content of the Flash
- Low voltage detection during Flash erase

Note: If a Flash programmer and its software needs to use a handshaking pin, Cypress suggests to the tool vendor to support at least port P00\_1 on pin 19.

If handshaking is used by the tool but P00\_1 is not available in customer's application, Cypress suggests to the customer to check the tool manual or to contact the tool vendor for alternative handshaking pins.

### 13. Handling Devices

Special care is required for the following when handling the device:

- Latch-up prevention
- Unused pins handling
- External clock usage
- Unused sub clock signal
- Notes on PLL clock mode operation
- Power supply pins ( $V_{CC}/V_{SS}$ )
- Crystal oscillator circuit
- Turn on sequence of power supply to A/D converter and analog inputs
- Pin handling when not using the A/D converter
- Notes on energization
- Stabilization of power supply voltage
- Serial communication

#### 13.1 Latch-up prevention

CMOS IC chips may suffer latch-up under the following conditions:

- A voltage higher than  $V_{CC}$  or lower than  $V_{SS}$  is applied to an input or output pin.
- A voltage higher than the rated voltage is applied between  $V_{CC}$  pins and  $V_{SS}$  pins.

Latch-up may increase the power supply current dramatically, causing thermal damages to the device.

#### 13.2 Unused pins handling

Unused input pins can be left open when the input is disabled (corresponding bit of Port Input Enable register PIER = 0).

Leaving unused input pins open when the input is enabled may result in misbehavior and possible permanent damage of the device. They must therefore be pulled up or pulled down through resistors. To prevent latch-up, those resistors should be more than  $2\text{ k}\Omega$ .

Unused bidirectional pins can be set either to the output state and be then left open, or to the input state with either input disabled or external pull-up/pull-down resistor as described above.

#### 13.3 External clock usage

The permitted frequency range of an external clock depends on the oscillator type and configuration. See AC Characteristics for detailed modes and frequency limits. Single and opposite phase external clocks must be connected as follows:

##### 1. Single phase external clock

- When using a single phase external clock, X0 (X0A) pin must be driven and X1 (X1A) pin left open.

## 2. Opposite phase external clock

- When using an opposite phase external clock, X1 (X1A) must be supplied with a clock signal which has the opposite phase to the X0 (X0A) pins.

### 13.4 Unused sub clock signal

If the pins X0A and X1A are not connected to an oscillator, a pull-down resistor must be connected on the X0A pin and the X1A pin must be left open.

### 13.5 Notes on PLL clock mode operation

If the PLL clock mode is selected and no external oscillator is operating or no external clock is supplied, the microcontroller attempts to work with the free oscillating PLL. Performance of this operation, however, cannot be guaranteed.

### 13.6 Power supply pins ( $V_{CC}/V_{SS}$ )

It is required that all  $V_{CC}$ -level as well as all  $V_{SS}$ -level power supply pins are at the same potential. If there is more than one  $V_{CC}$  or  $V_{SS}$  level, the device may operate incorrectly or be damaged even within the guaranteed operating range.

$V_{CC}$  and  $V_{SS}$  must be connected to the device from the power supply with lowest possible impedance.

As a measure against power supply noise, it is required to connect a bypass capacitor of about 0.1  $\mu\text{F}$  between  $V_{CC}$  and  $V_{SS}$  as close as possible to  $V_{CC}$  and  $V_{SS}$  pins.

### 13.7 Crystal oscillator and ceramic resonator circuit

Noise at X0, X1 pins or X0A, X1A pins might cause abnormal operation. It is required to provide bypass capacitors with shortest possible distance to X0, X1 pins and X0A, X1A pins, crystal oscillator (or ceramic resonator) and ground lines, and, to the utmost effort, that the lines of oscillation circuit do not cross the lines of other circuits.

It is highly recommended to provide a printed circuit board art work surrounding X0, X1 pins and X0A, X1A pins with a ground area for stabilizing the operation.

It is highly recommended to evaluate the quartz/MCU or resonator/MCU system at the quartz or resonator manufacturer, especially when using low-Q resonators at higher frequencies.

### 13.8 Turn on sequence of power supply to A/D converter and analog inputs

It is required to turn the A/D converter power supply ( $AV_{CC}$ , AVRH, AVRL) and analog inputs (ANn) on after turning the digital power supply ( $V_{CC}$ ) on.

It is also required to turn the digital power off after turning the A/D converter supply and analog inputs off. In this case, the voltage must not exceed AVRH or  $AV_{CC}$  (turning the analog and digital power supplies simultaneously on or off is acceptable).

### 13.9 Pin handling when not using the A/D converter

It is required to connect the unused pins of the A/D converter as  $AV_{CC} = V_{CC}$ ,  $AV_{SS} = AVRH = AVRL = V_{SS}$ .

### 13.10 Notes on Power-on

To prevent malfunction of the internal voltage regulator, supply voltage profile while turning the power supply on should be slower than 50  $\mu\text{s}$  from 0.2 V to 2.7 V.

### **13.11 Stabilization of power supply voltage**

If the power supply voltage varies acutely even within the operation safety range of the Vcc power supply voltage, a malfunction may occur. The Vcc power supply voltage must therefore be stabilized. As stabilization guidelines, the power supply voltage must be stabilized in such a way that Vcc ripple fluctuations (peak to peak value) in the commercial frequencies (50 to 60 Hz) fall within 10% of the standard Vcc power supply voltage and the transient fluctuation rate becomes 0.1V/μs or less in instantaneous fluctuation for power supply switching.

### **13.12 Serial communication**

There is a possibility to receive wrong data due to noise or other causes on the serial communication.

Therefore, design a printed circuit board so as to avoid noise.

Consider receiving of wrong data when designing the system. For example apply a checksum and retransmit the data if an error occurs.

Operating ambient temperature	$T_A$	0	+70	°C	CY96V300C
		-40	+105		
		-40	+125		<sup>*6</sup>
Storage temperature	$T_{STG}$	-55	+150	°C	

- \*1:  $AV_{CC}$  and  $V_{CC}$  must be set to the same voltage. It is required that  $AV_{CC}$  does not exceed  $V_{CC}$  and that the voltage at the analog inputs does not exceed  $AV_{CC}$  neither when the power is switched on.
- \*2:  $V_I$  and  $V_O$  should not exceed  $V_{CC} + 0.3$  V.  $V_I$  should also not exceed the specified ratings. However if the maximum current to/from an input is limited by some means with external components, the  $I_{CLAMP}$  rating supersedes the  $V_I$  rating. Input/output voltages of standard ports depend on  $V_{CC}$ .
- \*3:
  - Applicable to all general purpose I/O pins (Pnn\_m)
  - Use within recommended operating conditions.
  - Use at DC voltage (current)
  - The +B signal should always be applied a limiting resistance placed between the +B signal and the microcontroller.
  - The value of the limiting resistance should be set so that when the +B signal is applied the input current to the microcontroller pin does not exceed rated values, either instantaneously or for prolonged periods.
  - Note that when the microcontroller drive current is low, such as in the power saving modes, the +B input potential may pass through the protective diode and increase the potential at the  $V_{CC}$  pin, and this may affect other devices.
  - Note that if a +B signal is input when the microcontroller power supply is off (not fixed at 0 V), the power supply is provided from the pins, so that incomplete operation may result.
  - Note that if the +B input is applied during power-on, the power supply is provided from the pins and the resulting supply voltage may not be sufficient to operate the Power reset (except devices with persistent low voltage reset in internal vector mode).
  - Sample recommended circuits:

- \*4: The maximum permitted power dissipation depends on the ambient temperature, the air flow velocity and the thermal conductance of the package on the PCB.  
 The actual power dissipation depends on the customer application and can be calculated as follows:  
 $P_D = P_{IO} + P_{INT}$   
 $P_{IO} = \sum (V_{OL} * I_{OL} + V_{OH} * I_{OH})$  (IO load power dissipation, sum is performed on all IO ports)  
 $P_{INT} = V_{CC} * (I_{CC} + I_A)$  (internal power dissipation)  
 $I_{CC}$  is the total core current consumption into  $V_{CC}$  as described in the “3. DC characteristics” and depends on the selected operation mode and clock frequency and the usage of functions like Flash programming or the clock modulator.  
 $I_A$  is the analog current consumption into  $AV_{CC}$ .
- \*5: Worst case value for a package mounted on single layer PCB at specified  $T_A$  without air flow.
- \*6: Please contact Cypress for reliability limitations when using under these conditions.

**WARNING:** Semiconductor devices can be permanently damaged by application of stress (voltage, current, temperature, etc.) in excess of absolute maximum ratings. Do not exceed these ratings.

**14.2 Recommended Operating Conditions**

Parameter	Symbol	Value			Unit	Remarks
		Min	Typ	Max		
Power supply voltage	$V_{CC}$	3.0	-	5.5	V	
Smoothing capacitor at C pin	$C_S$	3.5	4.7	15	$\mu\text{F}$	Use a X7R ceramic capacitor or a capacitor that has similar frequency characteristics

**WARNING:** The recommended operating conditions are required in order to ensure the normal operation of the semiconductor device. All of the device's electrical characteristics are warranted when the device is operated within these ranges. Always use semiconductor devices within their recommended operating condition ranges. Operation outside these ranges may adversely affect reliability and could result in device failure. No warranty is made with respect to uses, operating conditions, or combinations not represented on the data sheet. Users considering application outside the listed conditions are advised to contact their representatives beforehand.

- Notes:
- AC characteristic in CLK synchronized mode.
  - $C_L$  is the load capacity value of pins when testing.
  - Depending on the used machine clock frequency, the maximum possible baud rate can be limited by some parameters. These parameters are shown in "CY96300 Super series Hardware Manual".
  - $t_{CLKP1}$  is the cycle time of the peripheral clock 1 (CLKP1), Unit : ns

\*1: Parameter N depends on  $t_{SCYCI}$  and can be calculated as follows:

- if  $t_{SCYCI} = 2 * k * t_{CLKP1}$ , then  $N = k$ , where k is an integer > 2
- if  $t_{SCYCI} = (2 * k + 1) * t_{CLKP1}$ , then  $N = k + 1$ , where k is an integer > 1

Examples:

$t_{scyci}$	N
$4 * t_{CLKP1}$	2
$5 * t_{CLKP1}, 6 * t_{CLKP1}$	3
$7 * t_{CLKP1}, 8 * t_{CLKP1}$	4

**Definition of A/D Converter Terms**

Resolution: Analog variation that is recognized by an A/D converter.

Total error: Difference between the actual value and the ideal value. The total error includes zero transition error, full-scale transition error and nonlinearity error.

Nonlinearity error: Deviation between a line across zero-transition line (“00 0000 0000” <--> “00 0000 0001”) and full-scale transition line (“11 1111 1110” <--> “11 1111 1111”) and actual conversion characteristics.

Differential nonlinearity error: Deviation of input voltage, which is required for changing output code by 1 LSB, from an ideal value.

Zero reading voltage: Input voltage which results in the minimum conversion value.

Full scale reading voltage: Input voltage which results in the maximum conversion value.

$$\text{Total error of digital output "N"} = \frac{V_{NT} - \{1 \text{ LSB} \times (N - 1) + 0.5 \text{ LSB}\}}{1 \text{ LSB}} \text{ [LSB]}$$

$$1 \text{ LSB} = (\text{Ideal value}) \frac{AVRH - AVRL}{1024} \text{ [V]}$$

N: A/D converter digital output value

$$V_{OT} (\text{Ideal value}) = AVRL + 0.5 \text{ LSB [V]}$$

$$V_{FST} (\text{Ideal value}) = AVRH - 1.5 \text{ LSB [V]}$$

V<sub>NT</sub> : A voltage at which digital output transitions from (N - 1) to N.

Nonlinearity error

Differential nonlinearity error

$$\text{Nonlinearity error of digital output } N = \frac{V_{NT} - \{1 \text{ LSB} \times (N - 1) + V_{OT}\}}{1 \text{ LSB}} \text{ [LSB]}$$

$$\text{Differential nonlinearity error of digital output } N = \frac{V_{(N+1)T} - V_{NT}}{1 \text{ LSB}} - 1 \text{ LSB [LSB]}$$

$$1 \text{ LSB} = \frac{V_{FST} - V_{OT}}{1022} \text{ [V]}$$

N : A/D converter digital output value

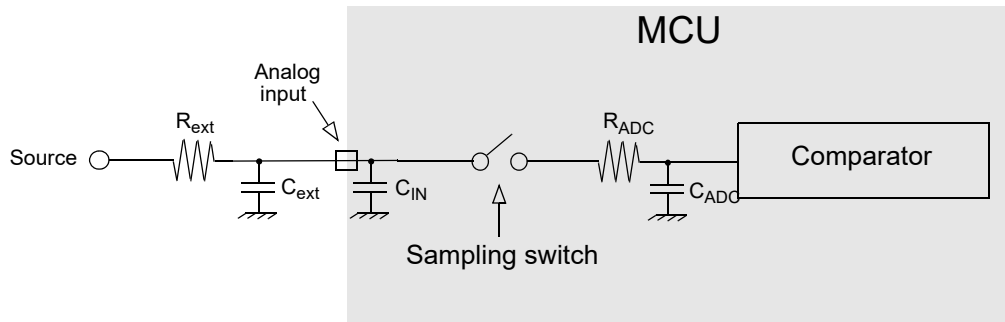

V<sub>OT</sub> : Voltage at which digital output transits from “000<sub>H</sub>” to “001<sub>H</sub>.”

V<sub>FST</sub> : Voltage at which digital output transits from “3FE<sub>H</sub>” to “3FF<sub>H</sub>.”

**Accuracy and setting of the A/D Converter sampling time**

If the external impedance is too high or the sampling time too short, the analog voltage charged to the internal sample and hold capacitor is insufficient, adversely affecting the A/D conversion precision.

To satisfy the A/D conversion precision, a sufficient sampling time must be selected. The required sampling time depends on the external driving impedance  $R_{ext}$ , the board capacitance of the A/D converter input pin  $C_{ext}$  and the  $AV_{cc}$  voltage level. The following replacement model can be used for the calculation:

- $R_{ext}$ : external driving impedance
- $C_{ext}$ : capacitance of PCB at A/D converter input
- $C_{IN}$ : capacitance of MCU input pin: 15pF (max)
- $R_{ADC}$ : resistance within MCU: 2.6k $\Omega$  (max) for 4.5V  $\leq$   $AV_{cc}$   $\leq$  5.5V  
12k $\Omega$  (max) for 3.0V  $\leq$   $AV_{cc}$  < 4.5V
- $C_{ADC}$ : sampling capacitance within MCU: 10pF (max)

The sampling time should be set to minimum “7 $\tau$ “. The following approximation formula for the replacement model above can be used:

$$T_{s\text{amp}} [\text{min}] = 7 \times (R_{ext} \times (C_{ext} + C_{IN}) + (R_{ext} + R_{ADC}) \times C_{ADC})$$

- Do not select a sampling time below the absolute minimum permitted value (0.5 $\mu$ s for 4.5V  $\leq$   $AV_{cc}$   $\leq$  5.5V; 1.2  $\mu$ s for 3.0V  $\leq$   $AV_{cc}$  < 4.5V).
- If the sampling time cannot be sufficient, connect a capacitor of about 0.1  $\mu$ F to the analog input pin. In this case the internal sampling capacitance  $C_{ADC}$  will be charged out of this external capacitance.
- A big external driving impedance also adversely affects the A/D conversion precision due to the pin input leakage current  $I_{IL}$  (static current before the sampling switch) or the analog input leakage current  $I_{AIN}$  (total leakage current of pin input and comparator during sampling). The effect of the pin input leakage current  $I_{IL}$  cannot be compensated by an external capacitor.
- The accuracy gets worse as  $|AVRH - AVRL|$  becomes smaller.

**14.6 Low Voltage Detector characteristics**

( $T_A = -40\text{ }^\circ\text{C}$  to  $+125\text{ }^\circ\text{C}$ ,  $V_{CC} = AV_{CC} = 3.0\text{V} - 5.5\text{V}$ ,  $V_{SS} = AV_{SS} = 0\text{V}$ )

CILCR:LVL[3:0] are the low voltage detector level select bits of the CILCR register.

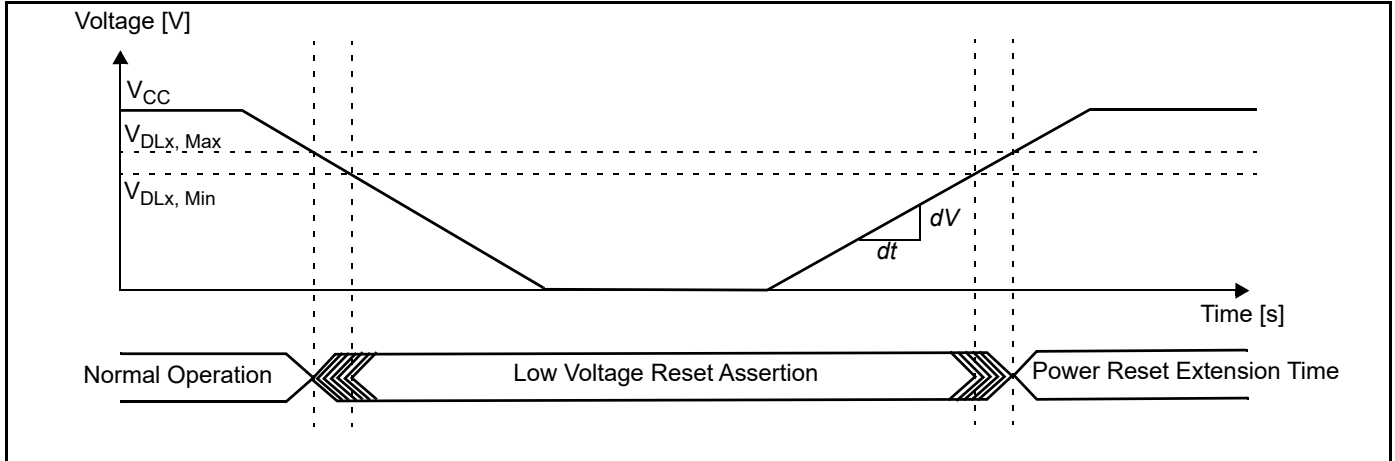

For correct detection, the slope of the voltage level must satisfy  $\left| \frac{dV}{dt} \right| \leq 0.004 \frac{V}{\mu\text{s}}$ .

Faster variations are regarded as noise and may not be detected.

The functional operation of the MCU is guaranteed down to the minimum low voltage detection level of "Level 0" ( $V_{DL0\_MIN}$ ). The electrical characteristics however are only valid in the specified range (usually down to 3.0V).

### Low Voltage Detector Operation

In the following figure, the occurrence of a low voltage condition is illustrated. For a detailed description of the reset and startup behavior, please refer to the corresponding hardware manual chapter.

- $T_a = 25^{\circ}C$
- $f_{CLKS1} = f_{CLKB}$  or  $f_{CLKS1} = 2 * f_{CLKB}$  as described in diagram
- $f_{CLKS2} = f_{CLKS1}$
- $f_{CLKP1} = f_{CLKB}$
- $f_{CLKP2} = f_{CLKB}/2$
- Core voltage at 1.8V (VRCR:HPM[1:0] = 10<sub>B</sub>) or 1.9V (VRCR:HPM[1:0] = 11<sub>B</sub>) as described in diagram
- Main clock = 4MHz external clock
- Flash memory timing settings:
  - MTCRA=2128<sub>H</sub>/2208<sub>H</sub> (0 Flash wait states,  $f_{CLKS1} = 2 * f_{CLKB}$ )
  - MTCRA=0239<sub>H</sub>/2129<sub>H</sub> (1 Flash wait state,  $f_{CLKS1} = f_{CLKB}$ )
  - MTCRA=4C09<sub>H</sub>/6B09<sub>H</sub> (1 Flash wait state,  $f_{CLKS1} = 2 * f_{CLKB}$ )
  - MTCRA=233A<sub>H</sub> (2 Flash wait states,  $f_{CLKS1} = f_{CLKB}$ )
- Average Flash access rate (number of read accesses to the Flash per CLKB clock cycle, no buffer hit):
  - 0 Flash wait states: 0.5
  - 1 Flash wait states: 0.33
  - 2 Flash wait states: 0.25

## 19. Major Changes

Spancion Publication Number: DS07-13808-2E

Page	Section	Change Results
3	Features	Corrected the sentence “Reload timer overflow” to “Reload timer underflow” for Programmable Pulse Generator.
5, 6	Product Lineup	Removed footnote. Changed name of evaluation sample.
8	Pin Assignments	Corrected pin number of X0. 34 → 35
14	Memory Map	Changed name of evaluation sample.
17	Serial Programming Communication Interface	Corrected device name, package name and pin numbers.
49-50	Electrical Characteristics 3.DC Characteristics	Note added in DC characteristics how to select driving strength of ports.
51-56	Electrical Characteristics 3.DC Characteristics	Updated I <sub>cc</sub> specs. Updated Power Supply current spec in Run/Sleep/Timer/Stop modes (new spec items in PLL Run/Sleep mode, small adjustment of most other values).
57	Electrical Characteristics 4.AC Characteristics	Note added that PLL phase jitter spec does not include jitter coming from Main clock. Added specification of RC clock stabilization time.
65	Electrical Characteristics 5. Analog Digital Converter	Changed the item for “Zero reading voltage” and “Full scale reading voltage”. AD converter I <sub>AIN</sub> spec improved: 1uA valid up to 105deg, 1.2uA above 105deg.
68	Electrical Characteristics 5. Analog Digital Converter	“Notes on A/D Converter Section” was rewrite and renamed to “Accuracy and setting of the A/D Converter sampling time”. Impact of input pin capacitance and external capacitance added to formula for calculation of the sampling time.
69	Electrical Characteristics 6. Low Voltage Detector Characteristics	Detection levels updated.
72-77	Example Characteristics	Added.
78	Package Dimension MB96(F)31x LQFP48	Updated package figure. Added the following sentence under the figure: “Please check the latest package dimension at the following URL. <a href="http://edevice.fujitsu.com/package/en-search/">http://edevice.fujitsu.com/package/en-search/</a> ”.
79	Ordering Information	Updated part number: MB96F313/F315**A → MB96F313/F315**B Removed footnote. Added Part Numbers “MB96F313RSB PMC-GSE1”, “MB96F315RSB PMC-GSE1”.

"High-Risk Device" means any device or system whose failure could cause personal injury, death, or property damage. Examples of High-Risk Devices are weapons, nuclear installations, surgical implants, and other medical devices. "Critical Component" means any component of a High-Risk Device whose failure to perform can be reasonably expected to cause, directly or indirectly, the failure of the High-Risk Device, or to affect its safety or effectiveness. Cypress is not liable, in whole or in part, and you shall and hereby do release Cypress from any claim, damage, or other liability arising from any use of a Cypress product as a Critical Component in a High-Risk Device. You shall indemnify and hold Cypress, its directors, officers, employees, agents, affiliates, distributors, and assigns harmless from and against all claims, costs, damages, and expenses, arising out of any claim, including claims for product liability, personal injury or death, or property damage arising from any use of a Cypress product as a Critical Component in a High-Risk Device. Cypress products are not intended or authorized for use as a Critical Component in any High-Risk Device except to the limited extent that (i) Cypress's published data sheet for the product explicitly states Cypress has qualified the product for use in a specific High-Risk Device, or (ii) Cypress has given you advance written authorization to use the product as a Critical Component in the specific High-Risk Device and you have signed a separate indemnification agreement.
