SW - M - 04B

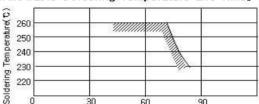

6.Caution

- ▶ Reflow Soldering
- 1. The sudden temperature change easily causes mechanical damages to ceramic components. Therefore, the preheating procedures should be required for the soldering of ceramic components.
- 2. Please refer to the recommended soldering profiles as shown in figures, and keep the temperature difference $(\triangle T)$ within the range recommended in Table 1.

Table 1

Size code	Temperature Difference
0603, 1005, 1608, 2012, 3216	∆T≤190℃
3225size and over	∆T≤130℃

30

ា

In case of repeated soldering, the accumulated soldering time must be within the range shown above.

60

90 Soldering time(sec.)

► Storage Condition

*When Solderability is considered. Capacitor are recommended to be used in 12 months

- (1) Temperature: 25°C ± 10°C
- (2) Relative Humidity: Below 70% RH
- ▶ The Regulation of Environmental Pollution Materials.

*Never use materials mentioned below in MLCC products regulated this document.

Pb, Cd, Hg, Cr⁺⁶, PBB(Polybromide biphenyl), PBDE(Polybrominated diphenyl ethers), asbestos.

	SW - M - 04B 8 / 8
Note	
(1) 'Aging'/'De-aging' Behavior of high dielectric MLCCs	
(Typically represented by X7R, Y5V temperature characteristic of	which main composition is BaTiO3
'Aging' / 'De-aging' Behavior of high dielectric MLCCs Please note	that high dielectric type dielectric
Ceramic Capacitors have a "normal" 'aging' behavior / characterist	ic, that is; their capacitance
value decreases with time from its value when it was first manufac	
capacitance value begins to decrease at a logarithmic rate defined	by:
$C_t = C_{24} (1 - k \log 10 t)$	
where :	
where ·	
C_t = Capacitance Value, t hours after the start of 'aging'	
C ₂₄ = Capacitance Value, 24 hours after its manufacture	
k = aging constant (capacitance decrease per decade-hour) t = time, in hours, from the start of 'aging'	
t - time, in nours, nom the start of aging	
Ceramic's Capacitance Change (%) versus	(ime (Hours)
10	
5	
Ψ 0	COG X8R
6 -5 au	X7R
ප් -10	X5R
0 -15	ASK
Capacitance -5 -0 -5 -0 -15 -20 -25 -25	
<u>d</u> -25 0 30	¥5V

The capacitance value can be restored (a.k.a. 'de-aged') by exposing the component to elevated temperatures approaching its Curie Temperature (approximately 120°C). This 'deaging' can occur during the component's solder-assembly onto the PCB, during life or temperature cycle testing., or by ' baking ' at 150℃ for about 1 hour.

Time [hr.]
