

RMPA2259 28 dBm WCDMA PowerEdge™ Power Amplifier Module

Features

Device

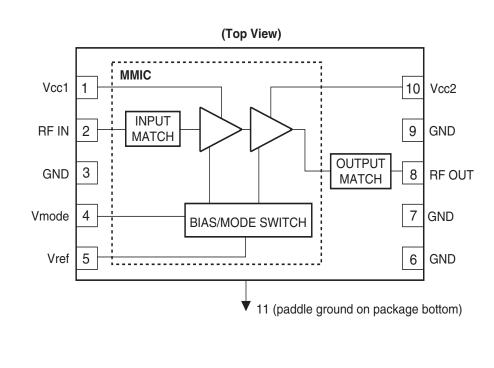

- 40% CDMA efficiency at +28dBm average output power
- Single positive-supply operation and low power and shutdown modes
- Meets WCDMA/UTMS and HSDPA performance requirements
- Compact Lead-free compliant LCC package - 4.0 x 4.0 x 1.5 mm
- Industry standard pinout
- Internally matched to 50Ω and DC blocked RF input/output

General Description

The RMPA2259 power amplifier module (PAM) is designed for WCDMA/UTMS and HSDPA applications. The 2-stage PAM is internally matched to 50Ω to minimize the use of external components and features a low-power mode to reduce standby current and DC power consumption during peak phone usage. High power-added efficiency and excellent linearity are achieved using our InGaP Heterojunction Bipolar Transistor (HBT) process.

Functional Block Diagram

Absolute Maximum Ratings⁽¹⁾

Symbol	Parameter	Ratings	Units
V _{CC1} , V _{CC2}	Supply Voltages	5.0	V
V _{ref}	Reference Voltage	2.6 to 3.5	V
V _{mode}	Power Control Voltage	3.5	V
P _{IN}	RF Input Power	+10	dBm
T _{STG}	Storage Temperature	-55 to +150	°C

Note:

1. No permanent damage with one parameter set at extreme limit. Other parameters set to typical values.

Electrical Characteristics⁽¹⁾

Symbol	Parameter	Min.	Тур.	Max.	Units	Comments
f	Operating Frequency	1920		1980	MHz	
WCDMA C	DPERATION					1
Gp	Power Gain		26.5		dB	Po = +28dBm; Vmode = 0V
			24		dB	$Po = +16dBm; Vmode \ge 2.0V$
Po	Linear Output Power	28			dBm	Vmode = 0V
		16			dBm	Vmode ≥ 2.0V
PAEd	PAEd (digital) @ +28dBm		40		%	Vmode = 0V
	PAEd (digital) @ +16dBm		9		%	Vmode ≥ 2.0V
	PAEd (digital) @ +16dBm		20		%	Vmode \geq 2.0V, Vcc = 1.4V
Itot	High Power Total Current		450		mA	Po = +28dBm, Vmode = 0V
	Low Power Total Current		130		mA	$Po = +16dBm$, $Vmode \ge 2.0V$
	Adjacent Channel Leakage Ratio					WCDMA Modulation 3GPP 3.2 03-00 DPCCH+1 DCDCH
ACLR1	±5.0MHz Offset		-40		dBc	Po = +28dBm; Vmode = 0V
			-43		dBc	$Po = +16dBm; Vmode \ge 2.0V$
ACLR2	±10.0MHz Offset		-53		dBc	Po = +28dBm; Vmode = 0V
			-66		dBc	$Po = +16dBm; Vmode \ge 2.0V$
GENERAL	CHARACTERISTICS					
VSWR	Input Impedance		2.0:1			
NF	Noise Figure		3		dB	
Rx No	Receive Band Noise Power		-139		dBm/Hz	$Po \le +28dBm$; 2110 to 2170MHz
2fo-5fo	Harmonic Suppression ⁽³⁾			-30	dBc	$Po \leq +28dBm$
S	Spurious Outputs ⁽²⁾⁽³⁾			-60	dBc	Load VSWR \leq 5.0:1
	Ruggedness w/ Load Mismatch ⁽³⁾			10:1		No permanent damage
Tc	Case Operating Temperature	-30		85	°C	
DC CHAR	ACTERISTICS					
lccq	Quiescent Current		50		mA	Vmode \geq 2.0V
Iref	Reference Current		5	8	mA	$Po \leq +28dBm$
Icc(off)	Shutdown Leakage Current		1	5	μA	No applied RF signal

Notes:

1. All parameters met at Tc = +25°C, Vcc = +3.4V, f = 1950MHz, and load VSWR \leq 1.2:1.

2. All phase angles.

3. Guaranteed by design.

Recommended Operating Conditions⁽¹⁾

Symbol	Parameter	Min.	Тур.	Max.	Units
f	Operating Frequency	1920		1980	MHz
Vcc1, Vcc2	Supply Voltage	3.0	3.4	4.2	V
Vref	Reference Voltage Operating Shutdown	2.7 0	2.85	3.1 0.5	V V
Vmode	Bias Control Voltage Low-Power High-Power	1.8 0	2.0	3.0 0.5	V V
Pout	Linear Output Power High-Power Low-Power			+28 +16	dBm dBm
Тс	Case Operating Temperature	-30		+85	°C

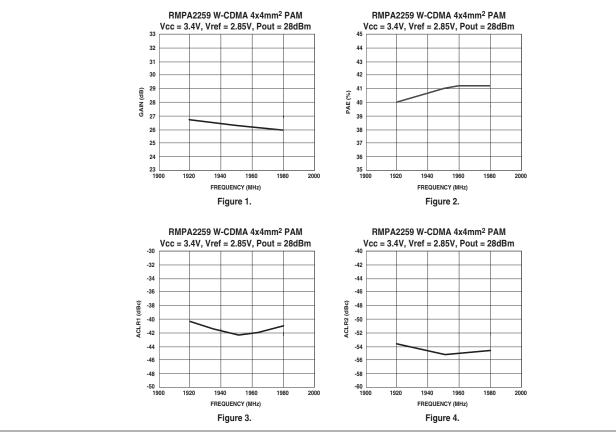

Note:

1. RF input power for WCDMA Pout = +28dBm.

DC Turn On Sequence:

- 1.Vcc1 = Vcc2 = 3.4V (typical)
- 2. Vref = 2.85V (typical)
- 3. High-Power: Vmode = 0V (Pout > 16dBm) Low-Power: Vmode = 2.0V (Pout < 16dBm)

Performance Data

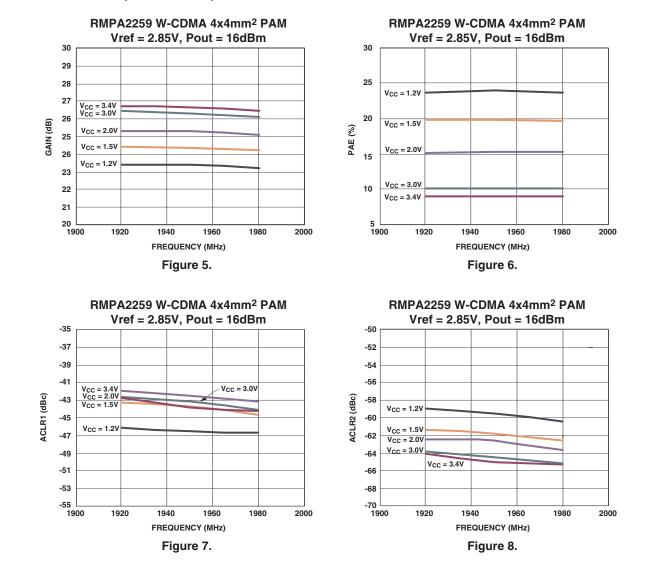

Efficiency Improvement Application

In addition to high-power/low-power bias modes, the efficiency of the PA module can be significantly increased at backed-off RF power levels by dynamically varying the supply voltage (Vcc) applied to the amplifier. Since mobile handsets and power amplifiers frequently operate at 10–20dB back-off, or more, from maximum rated linear power, battery life is highly dependent on the DC power consumed at antenna power levels in the range of 0 to +16dBm. The reduced demand on transmitted RF power allows the PA supply voltage to be reduced for improved efficiency, while still meeting linearity requirements for CDMA modulation with excellent margin. Highefficiency DC-DC converters are now available to implement switched-voltage operation. The following charts show measured performance of the PA module in low-power mode (Vmode = +2.0V) at +16dBm output power and over a range of supply voltages from 3.4V nominal to 1.2V. Power-added efficiency is more than doubled from 9.5 percent to nearly 25 percent (Vcc = 1.2V) while maintaining a typical ACLR1 of -46dBc and ACLR2 of approximately -60dBc.

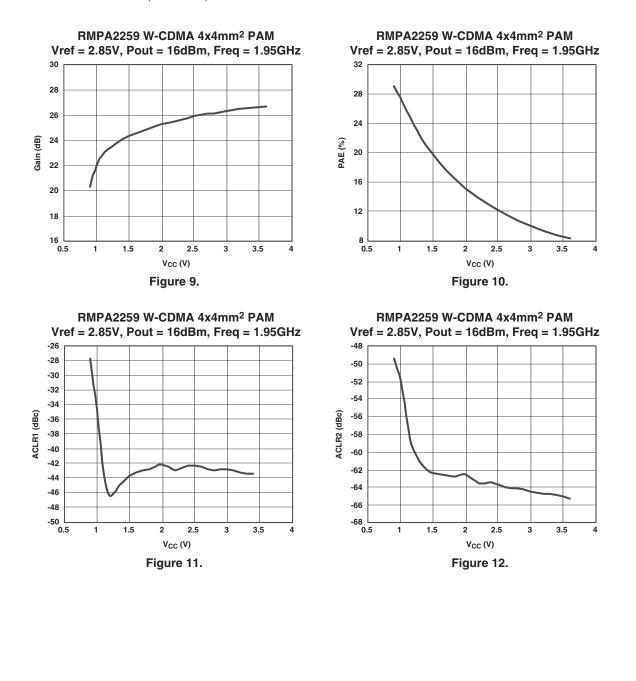

Operation at even lower levels of Vcc supply voltage are possible with a further restriction on the maximum RF output power. As shown below, the PA module can be biased at a supply voltage of as low as 0.7V with an efficiency as high as 10–12 percent at +8dBm output power. Excellent signal linearity is still maintained even under this low supply voltage condition.

10	Vcc2	Supply Voltage to Output Stage	
11	GND	Paddle Ground	

Applications Information

CAUTION: THIS IS AN ESD SENSITIVE DEVICE.

Precautions to Avoid Permanent Device Damage:

- Cleanliness: Observe proper handling procedures to ensure clean devices and PCBs. Devices should remain in their original packaging until component placement to ensure no contamination or damage to RF, DC and ground contact areas.
- Device Cleaning: Standard board cleaning techniques should not present device problems provided that the boards are properly dried to remove solvents or water residues.
- Static Sensitivity: Follow ESD precautions to protect against ESD damage:
 - A properly grounded static-dissipative surface on which to place devices.
 - Static-dissipative floor or mat.
 - A properly grounded conductive wrist strap for each person to wear while handling devices.
- General Handling: Handle the package on the top with a vacuum collet or along the edges with a sharp pair of bent tweezers. Avoiding damaging the RF, DC, and ground contacts on the package bottom. Do not apply excessive pressure to the top of the lid.
- Device Storage: Devices are supplied in heat-sealed, moisture-barrier bags. In this condition, devices are protected and require no special storage conditions. Once the sealed bag has been opened, devices should be stored in a dry nitrogen environment.

Device Usage:

Fairchild recommends the following procedures prior to assembly.

- Assemble the devices within 7 days of removal from the dry pack.
- During the 7-day period, the devices must be stored in an environment of less than 60% relative humidity and a maximum temperature of 30°C
- If the 7-day period or the environmental conditions have been exceeded, then the dry-bake procedure, at 125°C for 24 hours minimum, must be performed.

Solder Materials & Temperature Profile:

Reflow soldering is the preferred method of SMT attachment. Hand soldering is not recommended.

Reflow Profile

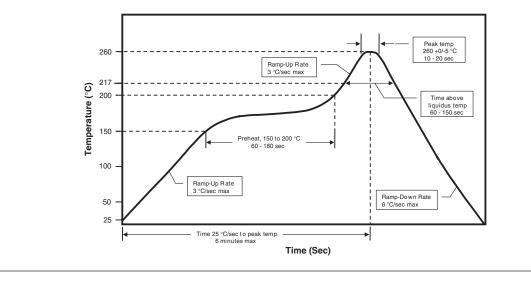

- Ramp-up: During this stage the solvents are evaporated from the solder paste. Care should be taken to prevent rapid oxidation (or paste slump) and solder bursts caused by violent solvent out-gassing. A maximum heating rate is 3°C/sec.
- Pre-heat/soak: The soak temperature stage serves two purposes; the flux is activated and the board and devices achieve a uniform temperature. The recommended soak condition is: 60-180 seconds at 150-200°C.
- Reflow Zone: If the temperature is too high, then devices may be damaged by mechanical stress due to thermal mismatch or there may be problems due to excessive solder oxidation. Excessive time at temperature can enhance the formation of inter-metallic compounds at the lead/board interface and may lead to early mechanical failure of the joint. Reflow must occur prior to the flux being completely driven off. The duration of peak reflow temperature should not exceed 20 seconds. Soldering temperatures should be in the range 255–260°C, with a maximum limit of 260°C.
- Cooling Zone: Steep thermal gradients may give rise to excessive thermal shock. However, rapid cooling promotes a finer grain structure and a more crack-resistant solder joint. The illustration below indicates the recommended soldering profile.

Solder Joint Characteristics:

Proper operation of this device depends on a reliable void-free attachment of the heat sink to the PWB. The solder joint should be 95% void-free and be a consistent thickness.

Rework Considerations:

Rework of a device attached to a board is limited to reflow of the solder with a heat gun. The device should be subjected to no more than 15° C above the solder melting temperature for no more than 5 seconds. No more than 2 rework operations should be performed.

Recommended Solder Reflow Profile

DISCLAIMER

FAIRCHILD SEMICONDUCTOR RESERVES THE RIGHT TO MAKE CHANGES WITHOUT FURTHER NOTICE TO ANY PRODUCTS HEREIN TO IMPROVE RELIABILITY, FUNCTION, OR DESIGN. FAIRCHILD DOES NOT ASSUME ANY LIABILITY ARISING OUT OF THE APPLICATION OR USE OF ANY PRODUCT OR CIRCUIT DESCRIBED HEREIN; NEITHER DOES IT CONVEY ANY LICENSE UNDER ITS PATENT RIGHTS, NOR THE RIGHTS OF OTHERS. THESE SPECIFICATIONS DO NOT EXPAND THE TERMS OF FAIRCHILD'S WORLDWIDE TERMS AND CONDITIONS, SPECIFICALLY THE WARRANTY THEREIN, WHICH COVERS THESE PRODUCTS.

LIFE SUPPORT POLICY

FAIRCHILD'S PRODUCTS ARE NOT AUTHORIZED FOR USE AS CRITICAL COMPONENTS IN LIFE SUPPORT DEVICES OR SYSTEMS WITHOUT THE EXPRESS WRITTEN APPROVAL OF FAIRCHILD SEMICONDUCTOR CORPORATION.

As used herein:

1. Life support devices or systems are devices or systems which, (a) are intended for surgical implant into the body, or (b) support or sustain life, or (c) whose failure to perform when properly used in accordance with instructions for use provided in the labeling, can be reasonably expected to result in significant injury to the user. 2. A critical component is any component of a life support device or system whose failure to perform can be reasonably expected to cause the failure of the life support device or system, or to affect its safety or effectiveness.
