

LM831 Low Voltage Audio Power Amplifier

General Description

The LM831 is a dual audio power amplifier optimized for very low voltage operation. The LM831 has two independent amplifiers, giving stereo or higher power bridge (BTL) operation from two- or three-cell power supplies.

The LM831 uses a patented compensation technique to reduce high-frequency radiation for optimum performance in AM radio applications. This compensation also results in lower distortion and less wide-band noise.

The input is direct-coupled to the LM831, eliminating the usual coupling capacitor. Voltage gain is adjustable with a single resistor.

Features

- Low voltage operation, 1.8V to 6.0V
- High power, 440 mW, 8 Ω , BTL, 3V
- Low AM radiation
- Low noise
- Low THD

Applications

- Portable tape recorders
- Portable radios
- Headphone stereo
- Portable speakers

Typical Application

Dual Amplifier with Minimum Parts

TL/H/6754-1

A_V 46 dB, BW = 250 Hz to 35 kHz

P_{OUT} 220 mW/CH, R_L 4 Ω

LM831 Circuit Description

The power supply is applied to Pin 9 and is filtered by resistor R_1 and capacitor C_{BY} on Pin 16. This filtered voltage at Pin 16 is used to bias all of the LM831 circuits except the power output stage. Resistor R_0 generates a biasing current that sets the output DC voltage for optimum output power for any given supply voltage.

Feedback is provided to the input transistor Q_1 emitter by R_6 and R_7 .

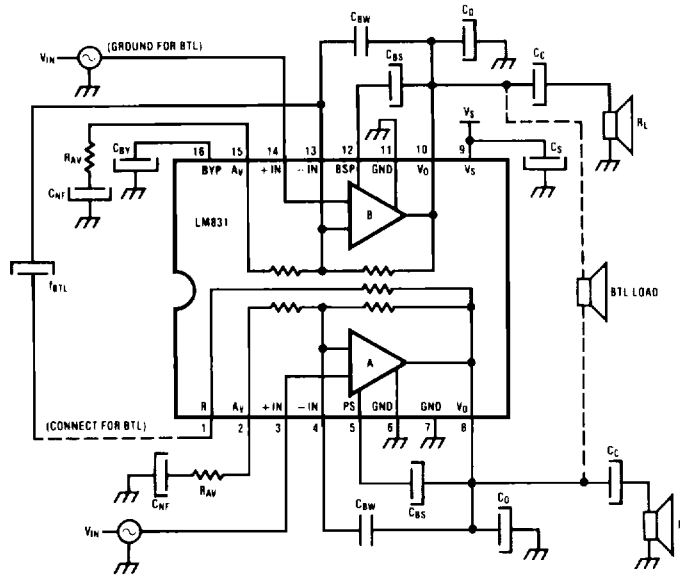

The capacitor C_{NF} on Pin 2 provides unity DC gain for maximum DC accuracy.

Q_2 provides voltage gain and the rest of the devices buffer the output load from Q_2 's collector.

Bootstrapping of Pin 5 by C_{BS} allows maximum output swing and improved supply rejection.

R_5 is provided for bridge (BTL) operation.

External Components (Refer to External Component Diagram)

Component	Comments	Min	Max
C _O	Required to stabilize output stage.	0.33 μF	1 μF
C _c	Output coupling capacitors for Dual Mode. Sets a low-frequency pole in the frequency response. $f_L = \frac{1}{2\pi C_c R_L}$	100 μF	10,000 μF
C _{BS}	Bootstrap capacitors. Sets a low-frequency pole in the power BW. Recommended value is $C_{BS} = \frac{1}{10 \cdot 2\pi \cdot f_L \cdot R_L}$	22 μF or (short Pins 4 & 12 to 9)	470 μF
C _S	Supply bypass. Larger values improve low-battery performance by reducing supply ripple.	47 μF	10,000 μF
C _{BY}	Filters the supply for improved low-voltage operation. Also sets turn-on delay.	47 μF	470 μF
C _{NF}	Sets a low-frequency response. Also affects turn-on delay. $f_L = \frac{1}{2\pi \cdot C_{NF} \cdot (R_{AV} + 80)}$ In BTL Mode, C _{NF} on Pin 15 can be reduced without affecting the frequency response. However, the turn-on "POP" will be worsened.	10 μF	100 μF
C _{BTL}	Used only in the Bridge Mode. Connects the output of the first amplifier to the inverting input of the other through an internal resistor. Sets a low-frequency pole in one-half the frequency response. $f_L = \frac{1}{2\pi \cdot C_{BTL} \cdot 16k}$	0.1 μF	1 μF
C _{BW}	Improves clipping waveform and sets the high-frequency bandwidth. Works with an internal 16k resistor. (This equation applies for R _{AV} ≠ 0. For 46 dB application, see BW-C _{BW} curve.) $f_H = \frac{1}{2\pi \cdot C_{BW} \cdot 16k}$	See table below	
R _{AV}	Used to reduce the gain and improve the distortion and signal to noise. If this is desired, C _{BW} must also be used.	See table below	

Typical A _v	R _{AV}	C _{BW}	
		Min	Max
46 dB	Short	Open	4700 pF
40 dB	82	100 pF	4700 pF
34 dB	240	270 pF	4700 pF
28 dB	560	500 pF	4700 pF
