

# Hex Buffer, Common Enable, 3-State

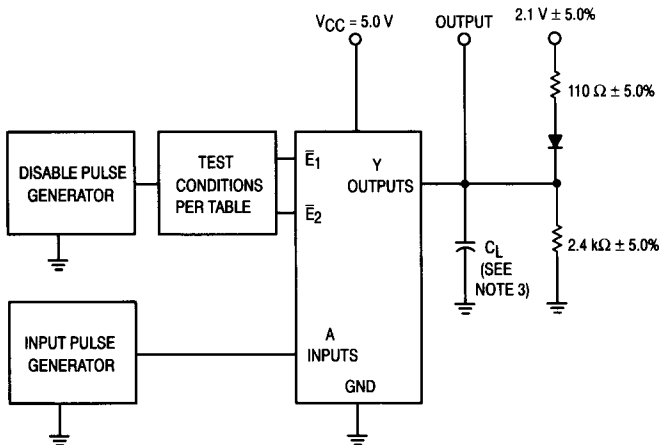

ELECTRICALLY TESTED PER:  
MIL-M-38510/32201

This device is a high-speed hex buffer with 3-state outputs. It is organized as a single 6-bit or 2-bit/4-bit, with inverting or non-inverting data (D) paths. The outputs are designed to drive 15 TTL Unit Loads or 60 Low Power Schottky loads when the Enable (E) is LOW.

When the Output Enable (E) is HIGH, the outputs are forced to a high impedance "off" state. If the outputs of the 3-state devices are tied together, all but one device must be in the high impedance state to avoid high currents that would exceed the maximum ratings. Designers should ensure that Output Enable signals to 3-state devices whose outputs are tied together are designed so there is no overlap.

AC TEST CIRCUIT

## VOLTAGE WAVEFORMS PROPAGATION DELAY TIMES

## VOLTAGE WAVEFORMS ENABLE AND DISABLE TIMES, THREE-STATE OUTPUTS

## NOTES:

1. Pulse generator has the following characteristics:  
 $t_r \leq 15 \text{ ns}$ ,  $t_f \leq 6.0 \text{ ns}$ .
2. Terminal conditions (pins not designated may be high  $\geq 2.0 \text{ V}$ , low  $\leq 0.7 \text{ V}$ , or open).
3.  $C_L = 50 \text{ pF} \pm 10\%$ , including scope probe, wiring and stray capacitance.
4. Voltage measurements are to be made with respect to network ground terminal.
