

- PCI Bus Power Management Interface Specification 1.0 Compliant
- ACPI 1.0 Compliant
- Fully Compatible With the Intel™ 430TX (Mobile Triton II) Chipset
- Packaged in 208-Pin TQFP
- PCI Local Bus Specification Revision 2.1 Compliant
- 1995 PC Card™ Standard Compliant
- 3.3-V Core Logic With Universal PCI Interfaces Compatible With 3.3-V and 5-V PCI Signaling Environments
- Mix-and-Match 5-V/3.3-V PC Card16 Cards and 3.3-V CardBus Cards
- Supports Two PC Card or CardBus Slots With Hot Insertion and Removal
- Uses Serial Interface to TI™ TPS2202/2206 Dual-Slot PC Card Power Switch
- Supports Burst Transfers to Maximize Data Throughput
- Supports Parallel PCI Interrupts, Parallel ISA IRQ and Parallel PCI Interrupts, Serial ISA IRQ With Parallel PCI Interrupts, and Serial ISA IRQ and PCI Interrupts
- Serial EEPROM Interface for Loading Subsystem ID and Subsystem Vendor ID
- Pipelined Architecture Allows Greater Than 130M-Bytes-Per-Second Throughput From CardBus to PCI and From PCI to CardBus
- Supports Up to Five General-Purpose I/Os
- Programmable Output Select for $\overline{\text{CLKRUN}}$
- Multifunction PCI Device With Separate Configuration Space for Each Socket
- Five PCI Memory Windows and Two I/O Windows Available for Each PC Card16 Socket
- Two I/O Windows and Two Memory Windows Available to Each CardBus Socket
- Exchangeable Card Architecture (ExCA) Compatible Registers Are Mapped in Memory and I/O Space
- Intel 82365SL-DF Register Compatible
- Supports Distributed DMA (DDMA) and PC/PCI DMA
- Supports 16-Bit DMA on Both PC Card Sockets
- Supports Ring Indicate, $\overline{\text{SUSPEND}}$, PCI $\overline{\text{CLKRUN}}$, and CardBus $\overline{\text{CCLKRUN}}$
- LED Activity Pins
- Supports PCI Bus Lock ($\overline{\text{LOCK}}$)
- Advanced Submicron, Low-Power CMOS Technology

PCI1220 PC CARD CONTROLLER

XCPS016 – DECEMBER 1997

description

The TI PCI1220 is a high-performance PCI-to-PC Card controller that supports two independent PC Card sockets compliant with the 1995 PC Card Standard. The PCI1220 provides a rich feature set that makes it the best choice for bridging between PCI and PC Cards in both notebook and desktop computers. The 1995 PC Card Standard retains the 16-bit PC Card specification defined in PCMCIA Release 2.1, and defines the new 32-bit PC Card, CardBus, capable of full 32-bit data transfers at 33 MHz. The PCI1220 supports any combination of 16-bit and CardBus PC Cards in the two sockets, powered at 5 V or 3.3 V, as required.

The PCI1220 is compliant with the PCI Local Bus Specification 2.1, and its PCI interface can act as either a PCI master device or a PCI slave device. The PCI bus mastering is initiated during 16-bit PC Card direct memory access (DMA) transfers or CardBus PC Card bridging transactions. The PCI1220 is also compliant with the latest *PCI Bus Power Management Interface Specification*.

All card signals are internally buffered to allow hot insertion and removal without external buffering. The PCI1220 is register compatible with the Intel 82365SL-DF ExCA controller. The PCI1220 internal data path logic allows the host to access 8-, 16-, and 32-bit cards using full 32-bit PCI cycles for maximum performance. Independent buffering and a pipeline architecture provide an unsurpassed performance level with sustained bursting. The PCI1220 can also be programmed to accept fast posted writes to improve system-bus utilization.

Multiple system-interrupt signaling options are provided, including: parallel PCI, parallel ISA, serialized ISA, and serialized PCI. Furthermore, general-purpose inputs and outputs are provided for the board designer to implement sideband functions. Many other features are designed into the PCI1220, such as socket activity light-emitting diode (LED) outputs, and are discussed in detail throughout the design specification.

An advanced complementary metal-oxide semiconductor (CMOS) process is used to achieve low system-power consumption while operating at PCI clock rates up to 33 MHz. Several low-power modes enable the host power management system to further reduce power consumption.

Unused PCI1220 inputs must be pulled up using a 43 k Ω resistor.

POST OFFICE BOX 655303 • DALLAS, TEXAS 75265

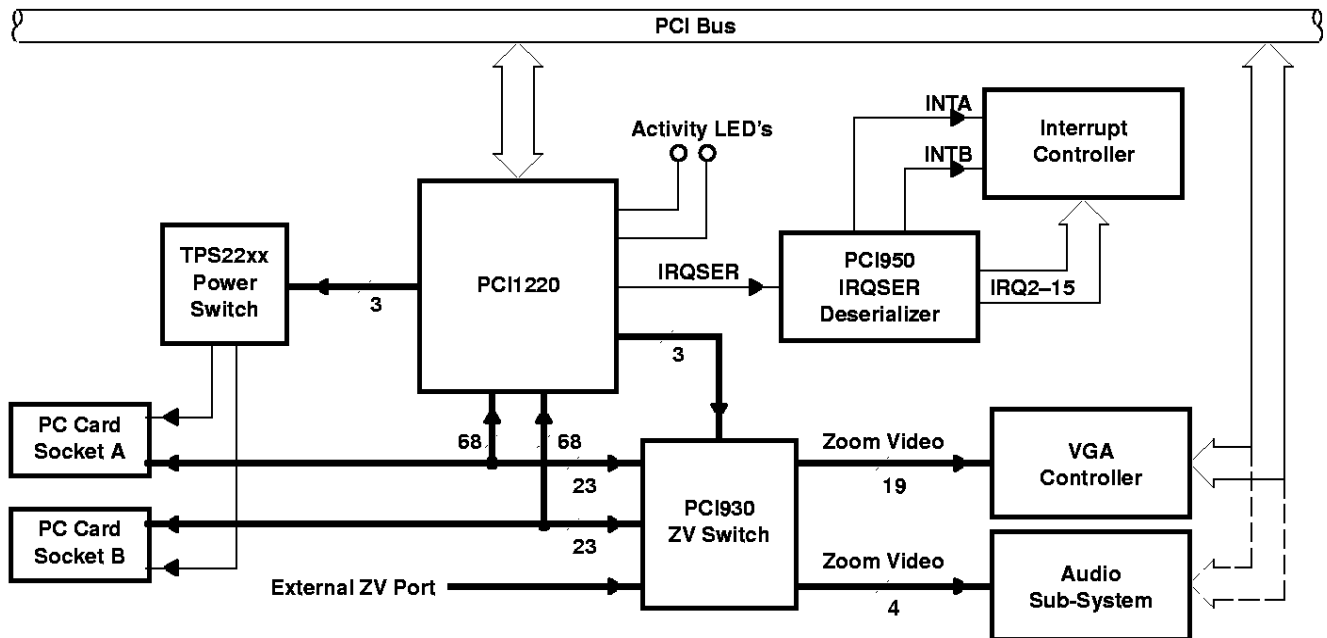

system block diagram

A simplified system block diagram using the PCI1220 is provided below. The PCI950 IRQ deserializer and the PCI930 zoomed video (ZV) switch are optional functions that can be used when the system requires that capability.

The PCI interface includes all address/data and control signals for PCI protocol. The 68-pin PC Card interface includes all address/data and control signals for CardBus and 16-bit (R2) protocols. When zoomed video (ZV) is enabled (in 16-bit PC Card mode) 23 of the 68 signals are redefined to support the ZV protocol.

The interrupt interface includes terminals for parallel PCI, parallel ISA, and serialized PCI and ISA signaling. Other miscellaneous system interface terminals are available on the PCI1220 that include:

- Programmable multifunction terminals
- SUSPEND, RI_OUT/PME (power management control signal)
- SPKROUT.

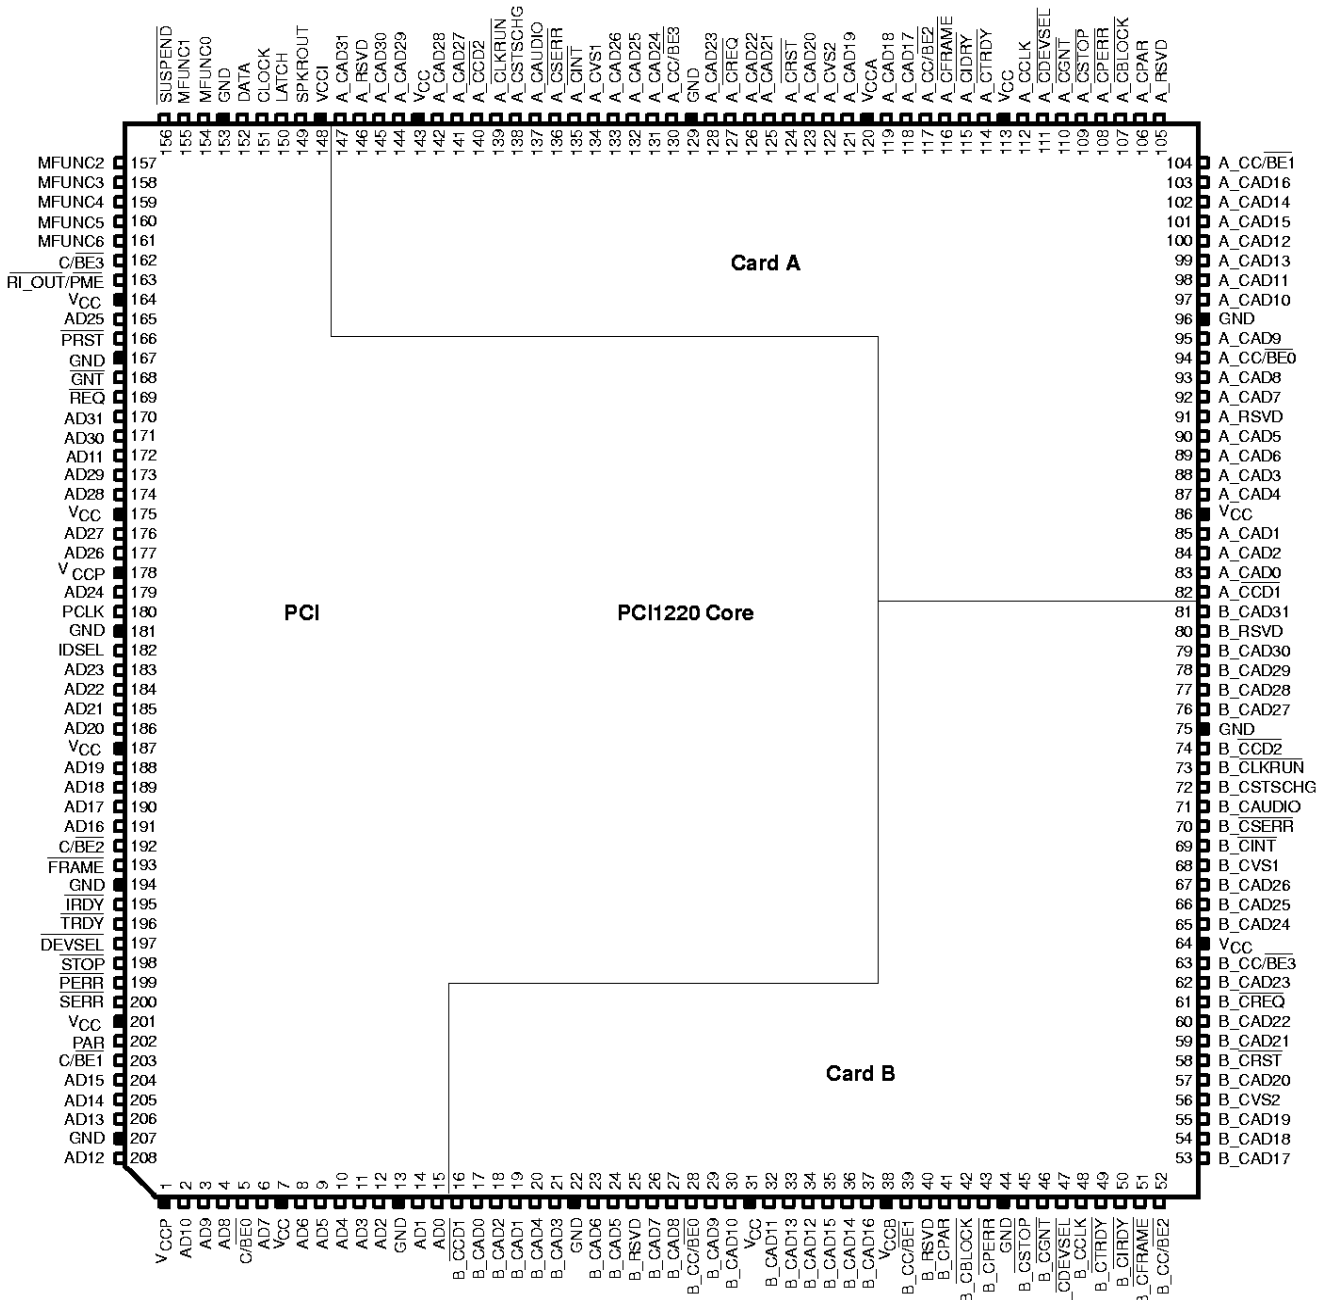

NOTE: The PC Card interface is 68 pins for CardBus and 16-bit PC Cards. In zoomed-video mode 23 pins are used for routing the zoomed video signals too the VGA controller.

PCI1220 PC CARD CONTROLLER

XCPS016 – DECEMBER 1997

Terminal Functions

The terminals are grouped in tables by functionality, such as PCI system function, power-supply function, etc. The terminal numbers are also listed for convenient reference.

power supply

NAME	TERMINAL NO.	FUNCTION
GND	13, 22, 44, 75, 96, 129, 153, 167, 181, 194, 207	Device ground terminals
VCC	7, 31, 64, 86, 113, 143, 164, 175, 187, 201	Power supply terminal for core logic (3.3 V)
VCCA	120	Rail power input for PC Card A interface. Indicates Card A signaling environment, 5 V or 3.3 V.
VCCB	38	Rail power input for PC Card B interface. Indicates Card B signaling environment, 5 V or 3.3 V.
VCCI	148	Rail power input for interrupt subsystem interface and miscellaneous I/O. (5 V or 3.3 V)
VCCP	1, 178	Rail power input for PCI signaling (5 V or 3.3 V)

PC Card power switch

TERMINAL NAME	TERMINAL NO.	I/O TYPE	FUNCTION
CLOCK	151	I/O	3-Line Power Switch Clock. Information on the DATA line is sampled at the rising edge of CLOCK. CLOCK defaults to an input, but can be changed to a PCI1220 output by using the P2CCLK bit in the System Control Register. The TPS2206 defines the maximum frequency of this signal to be 2MHz. If a system design defines this terminal an output, then this terminal requires an external pullup resistor. The frequency of the PCI1220 output CLOCK is derived from dividing the PCI CLK by 36.
DATA	152	O	3-Line Power Switch Data. DATA is used to serially communicate socket power control information to the power switch.
LATCH	150	O	3-Line Power Switch Latch. LATCH is asserted by the PCI1220 to indicate to the PC Card power switch that the data on the DATA line is valid. When a pulldown resistor is implemented on this terminal, the MFUNC4 and MFUNC1 terminals provide the serial EEPROM SCL and SDA interface.

PCI system

TERMINAL NAME	TERMINAL NO.	I/O TYPE	FUNCTION
PCLK	180	I	PCI bus clock. PCLK provides timing for all transactions on the PCI bus. All PCI signals are sampled at the rising edge of PCLK.
$\overline{\text{PRST}}$	166	I	PCI reset. When the PCI bus reset is asserted, $\overline{\text{PRST}}$ causes the PCI1220 to place all output buffers in a high-impedance state and reset all internal registers. When $\overline{\text{PRST}}$ is asserted, the device is completely nonfunctional. After $\overline{\text{PRST}}$ is deasserted, the PCI1220 is in its default state. When the $\overline{\text{SUSPEND}}$ and $\overline{\text{PRST}}$ are asserted, the device is protected from the $\overline{\text{PRST}}$ clearing the internal registers. All outputs are placed in a high-impedance state, but the contents of the registers are preserved.

Terminal Functions (Continued)

PCI address and data

TERMINAL NAME NO.	I/O TYPE	FUNCTION
AD31 170 AD30 171 AD29 173 AD28 174 AD27 176 AD26 177 AD25 165 AD24 179 AD23 183 AD22 184 AD21 185 AD20 186 AD19 188 AD18 189 AD17 190 AD16 191 AD15 204 AD14 205 AD13 206 AD12 208 AD11 172 AD10 2 AD9 3 AD8 4 AD7 6 AD6 8 AD5 9 AD4 10 AD3 11 AD2 12 AD1 14 AD0 15	I/O	PCI address/data bus. These signals make up the multiplexed PCI address and data bus on the primary interface. During the address phase of a primary bus PCI cycle, AD31–AD0 contain a 32-bit address or other destination information. During the data phase, AD31–AD0 contain data.
$\overline{C/BE3}$ 162 $\overline{C/BE2}$ 192 $\overline{C/BE1}$ 203 $\overline{C/BE0}$ 5	I/O	PCI bus commands and byte enables. These signals are multiplexed on the same PCI terminals. During the address phase of a primary bus PCI cycle, $\overline{C/BE3}$ – $\overline{C/BE0}$ define the bus command. During the data phase, this 4-bit bus is used as byte enables. The byte enables determine which byte paths of the full 32-bit data bus carry meaningful data. $\overline{C/BE0}$ applies to byte 0 (AD7–AD0), $\overline{C/BE1}$ applies to byte 1 (AD15–AD8), $\overline{C/BE2}$ applies to byte 2 (AD23–AD16), and $\overline{C/BE3}$ applies to byte 3 (AD31–AD24).
PAR 202	I/O	PCI bus parity. In all PCI bus read and write cycles, the PCI1220 calculates even parity across the AD31–AD0 and $\overline{C/BE3}$ – $\overline{C/BE0}$ buses. As an initiator during PCI cycles, the PCI1220 outputs this parity indicator with a one-PCLK delay. As a target during PCI cycles, the calculated parity is compared to the initiator's parity indicator. A compare error results in the assertion of a parity error (PERR).

PCI1220 PC CARD CONTROLLER

XCPS016 – DECEMBER 1997

Terminal Functions (Continued)

PCI interface control

TERMINAL NAME	NO.	I/O TYPE	FUNCTION
$\overline{\text{DEVSEL}}$	197	I/O	PCI device select. The PCI1220 asserts $\overline{\text{DEVSEL}}$ to claim a PCI cycle as the target device. As a PCI initiator on the bus, the PCI1220 monitors $\overline{\text{DEVSEL}}$ until a target responds. If no target responds before timeout occurs, the PCI1220 terminates the cycle with an initiator abort.
$\overline{\text{FRAME}}$	193	I/O	PCI cycle frame. $\overline{\text{FRAME}}$ is driven by the initiator of a bus cycle. $\overline{\text{FRAME}}$ is asserted to indicate that a bus transaction is beginning, and data transfers continue while this signal is asserted. When $\overline{\text{FRAME}}$ is deasserted, the PCI bus transaction is in the final data phase.
$\overline{\text{GNT}}$	168	I	PCI bus grant. $\overline{\text{GNT}}$ is driven by the PCI bus arbiter to grant the PCI1220 access to the PCI bus after the current data transaction has completed. $\overline{\text{GNT}}$ may or may not follow a PCI bus request, depending on the PCI bus parking algorithm.
IDSEL	182	I	Initialization device select. IDSEL selects the PCI1220 during configuration space accesses. IDSEL can be connected to one of the upper 24 PCI address lines on the PCI bus.
$\overline{\text{IRDY}}$	195	I/O	PCI initiator ready. $\overline{\text{IRDY}}$ indicates the PCI bus initiator's ability to complete the current data phase of the transaction. A data phase is completed on a rising edge of PCLK where both $\overline{\text{IRDY}}$ and $\overline{\text{TRDY}}$ are asserted. Until $\overline{\text{IRDY}}$ and $\overline{\text{TRDY}}$ are both sampled asserted, wait states are inserted.
$\overline{\text{PERR}}$	199	I/O	PCI parity error indicator. $\overline{\text{PERR}}$ is driven by a PCI device to indicate that calculated parity does not match PAR when $\overline{\text{PERR}}$ is enabled through bit 6 of the command register.
$\overline{\text{REQ}}$	169	O	PCI bus request. $\overline{\text{REQ}}$ is asserted by the PCI1220 to request access to the PCI bus as an initiator.
$\overline{\text{SERR}}$	200	O	PCI system error. $\overline{\text{SERR}}$ is an output that is pulsed from the PCI1220 when enabled through the command register indicating a system error has occurred. The PCI1220 need not be the target of the PCI cycle to assert this signal. When $\overline{\text{SERR}}$ is enabled in the control register, this signal also pulses, indicating that an address parity error has occurred on a CardBus interface.
$\overline{\text{STOP}}$	198	I/O	PCI cycle stop signal. $\overline{\text{STOP}}$ is driven by a PCI target to request the initiator to stop the current PCI bus transaction. $\overline{\text{STOP}}$ is used for target disconnects and is commonly asserted by target devices that do not support burst data transfers.
$\overline{\text{TRDY}}$	196	I/O	PCI target ready. $\overline{\text{TRDY}}$ indicates the primary bus target's ability to complete the current data phase of the transaction. A data phase is completed on a rising edge of PCLK when both $\overline{\text{IRDY}}$ and $\overline{\text{TRDY}}$ are asserted. Until both $\overline{\text{IRDY}}$ and $\overline{\text{TRDY}}$ are asserted, wait states are inserted.

Terminal Functions (Continued)

multifunction and miscellaneous pins

TERMINAL NAME	NO.	I/O TYPE	FUNCTION
MFUNC6	161	I/O	Multifunction Terminal 6. MFUNC6 can be configured as a PCI $\overline{\text{CLKRUN}}$ or a parallel IRQ.
MFUNC5	160	I/O	Multifunction Terminal 5. MFUNC5 can be configured as PC/PCI DMA Grant, GPI4, GPO4, socket activity LED output, ZV switching outputs, CardBus audio PWM, $\overline{\text{GPE}}$, or a parallel IRQ.
MFUNC4	159	I/O	Multifunction Terminal 4. MFUNC4 can be configured as PCI $\overline{\text{LOCK}}$, GPI3, GPO3, socket activity LED output, ZV switching outputs, CardBus audio PWM, $\overline{\text{GPE}}$, or a parallel IRQ. Serial Clock (SCL). When the serial bus mode is implemented by pulling the LATCH terminal low, the MFUNC4 terminal provides the SCL signaling. The two pin serial interface is used to load the subsystem identification and other register defaults from an EEPROM after a PCI reset.
MFUNC3	158	I/O	Multifunction Terminal 3. MFUNC3 can be configured as a parallel IRQ or the serialized interrupt signal IRQSER.
MFUNC2	157	I/O	Multifunction Terminal 2. MFUNC2 can be configured as PC/PCI DMA Request, GPI2, GPO2, socket activity LED output, ZV switching outputs, CardBus audio PWM, $\overline{\text{GPE}}$, or a parallel IRQ.
MFUNC1	155	I/O	Multifunction Terminal 1. MFUNC1 can be configured as parallel PCI interrupt $\overline{\text{INTB}}$, GPI1, GPO1, socket activity LED output, ZV switching outputs, CardBus audio PWM, $\overline{\text{GPE}}$, or a parallel IRQ. Serial Data (SDA). When the serial bus mode is implemented by pulling the LATCH terminal low, the MFUNC1 terminal provides the SDA signaling. The two pin serial interface is used to load the subsystem identification and other register defaults from an EEPROM after a PCI reset.
MFUNC0	154	I/O	Multifunction Terminal 0. MFUNC0 can be configured as parallel PCI interrupt $\overline{\text{INTA}}$, GPIO0, GPO0, socket activity LED output, ZV switching outputs, CardBus audio PWM, $\overline{\text{GPE}}$, or a parallel IRQ.
$\overline{\text{RI_OUT/PME}}$	163	O	Ring Indicate Output and Power Management Event. When configured by the <i>Card Control Register</i> as $\overline{\text{PME}}$, this terminal is used to indicate that a power management event is occurring. If the ring indicate function is enabled by the <i>Card Control Register</i> , the ring indicate signal is output on this terminal.
$\overline{\text{SUSPEND}}$	156	I	Suspend. $\overline{\text{SUSPEND}}$ is used to protect the internal registers from clearing when the $\overline{\text{PRST}}$ signal is asserted.
SPKROUT	149	O	Speaker output. SPKROUT is the output to the host system that can carry SPKR or CAUDIO through the PCI1220 from the PC Card interface. SPKROUT is driven as the exclusive-OR combination of card SPKR//CAUDIO inputs.

Terminal Functions (Continued)

16-bit PC Card interface control (slots A and B)

TERMINAL		NO.	I/O TYPE	FUNCTION
NAME	SLOT A†			
$\overline{\text{BVD1}}$ (STSCHG/R)	138	72	I	Battery voltage detect 1. BVD1 is generated by 16-bit memory PC Cards that include batteries. BVD1 is used with BVD2 as an indication of the condition of the batteries on a memory PC Card. Both BVD1 and BVD2 are kept high when the battery is good. When BVD2 is low and BVD1 is high, the battery is weak and should be replaced. When BVD1 is low, the battery is no longer serviceable and the data in the memory PC Card is lost. Status change. STSCHG is used to alert the system to a change in the READY, write protect, or battery voltage dead condition of a 16-bit I/O PC Card. Ring indicate. $\overline{\text{RI}}$ is used by 16-bit modem cards to indicate a ring detection.
$\overline{\text{BVD2}}$ (SPKR)	137	71	I	Battery voltage detect 2. BVD2 is generated by 16-bit memory PC Cards that include batteries. BVD2 is used with BVD1 as an indication of the condition of the batteries on a memory PC Card. Both BVD1 and BVD2 are high when the battery is good. When BVD2 is low and BVD1 is high, the battery is weak and should be replaced. When BVD1 is low, the battery is no longer serviceable and the data in the memory PC Card is lost. Speaker. $\overline{\text{SPKR}}$ is an optional binary audio signal available only when the card and socket have been configured for the 16-bit I/O interface. The audio signals from cards A and B are combined by the PCI1220 and are output on SPKROUT. DMA request. BVD2 can be used as the DMA request signal during DMA operations to a 16-bit PC Card that supports DMA. The PC Card asserts BVD2 to indicate a request for a DMA operation.
$\overline{\text{CD1}}$ $\overline{\text{CD2}}$	82 140	16 74	I	PC Card detect 1 and PC Card detect 2. $\overline{\text{CD1}}$ and $\overline{\text{CD2}}$ are internally connected to ground on the PC Card. When a PC Card is inserted into a socket, CD1 and CD2 are pulled low. For signal status, see <i>interface status register</i> .
$\overline{\text{CE1}}$ $\overline{\text{CE2}}$	94 97	28 30	O	Card enable 1 and card enable 2. $\overline{\text{CE1}}$ and $\overline{\text{CE2}}$ enable even- and odd-numbered address bytes. CE1 enables even-numbered address bytes, and CE2 enables odd-numbered address bytes.
$\overline{\text{INPACK}}$	127	61	I	Input acknowledge. $\overline{\text{INPACK}}$ is asserted by the PC Card when it can respond to an I/O read cycle at the current address. DMA request. $\overline{\text{INPACK}}$ can be used as the DMA request signal during DMA operations from a 16-bit PC Card that supports DMA. If used as a strobe, the PC Card asserts this signal to indicate a request for a DMA operation.
$\overline{\text{IORD}}$	99	33	O	I/O read. $\overline{\text{IORD}}$ is asserted by the PCI1220 to enable 16-bit I/O PC Card data output during host I/O read cycles. DMA write. $\overline{\text{IORD}}$ is used as the DMA write strobe during DMA operations from a 16-bit PC Card that supports DMA. The PCI1220 asserts $\overline{\text{IORD}}$ during DMA transfers from the PC Card to host memory.
$\overline{\text{IOWR}}$	101	35	O	I/O write. $\overline{\text{IOWR}}$ is driven low by the PCI1220 to strobe write data into 16-bit I/O PC Cards during host I/O write cycles. DMA read. $\overline{\text{IOWR}}$ is used as the DMA write strobe during DMA operations from a 16-bit PC Card that supports DMA. The PCI1220 asserts $\overline{\text{IOWR}}$ during transfers from host memory to the PC Card.
$\overline{\text{OE}}$	98	32	O	Output enable. $\overline{\text{OE}}$ is driven low by the PCI1220 to enable 16-bit memory PC Card data output during host memory read cycles. DMA terminal count. $\overline{\text{OE}}$ is used as terminal count (TC) during DMA operations to a 16-bit PC Card that supports DMA. The PCI1220 asserts OE to indicate TC for a DMA write operation.

† Terminal name for slot A is preceded with A_. For example, the full name for terminal 127 is A_INPACK.

‡ Terminal name for slot B is preceded with B_. For example, the full name for terminal 61 is B_INPACK.

PCI1220 PC CARD CONTROLLER

XCPS016 – DECEMBER 1997

Terminal Functions (Continued)

16-bit PC Card interface control (slots A and B) (continued)

TERMINAL NAME	NUMBER		I/O TYPE	FUNCTION
	SLOT A†	SLOT B‡		
READY (IREQ)	135	69	I	Ready. The ready function is provided by READY when the 16-bit PC Card and the host socket are configured for the memory-only interface. READY is driven low by the 16-bit memory PC Cards to indicate that the memory card circuits are busy processing a previous write command. READY is driven high when the 16-bit memory PC Card is ready to accept a new data transfer command. Interrupt request. IREQ is asserted by a 16-bit I/O PC Card to indicate to the host that a device on the 16-bit I/O PC Card requires service by the host software. IREQ is high (deasserted) when no interrupt is requested.
REG	130	63	O	Attribute memory select. REG remains high for all common memory accesses. When REG is asserted, access is limited to attribute memory (OE or WE active) and to the I/O space (IORD or IOWR active). Attribute memory is a separately accessed section of card memory and is generally used to record card capacity and other configuration and attribute information. DMA acknowledge. REG is used as a DMA acknowledge (DACK) during DMA operations to a 16-bit PC Card that supports DMA. The PCI1220 asserts REG to indicate a DMA operation. REG is used in conjunction with the DMA read (IOWR) or DMA write (IORD) strobes to transfer data.
RESET	124	58	O	PC Card reset. RESET forces a hard reset to a 16-bit PC Card.
WAIT	136	70	I	Bus cycle wait. WAIT is driven by a 16-bit PC Card to delay the completion of (i.e., extend) the memory or I/O cycle in progress.
WE	110	46	O	Write enable. WE is used to strobe memory write data into 16-bit memory PC Cards. WE is also used for memory PC Cards that employ programmable memory technologies. DMA terminal count. WE is used as TC during DMA operations to a 16-bit PC Card that supports DMA. The PCI1220 asserts WE to indicate TC for a DMA read operation.
WP (IOIS16)	139	73	I	Write protect. WP applies to 16-bit memory PC Cards. WP reflects the status of the write-protect switch on 16-bit memory PC Cards. For 16-bit I/O cards, WP is used for the 16-bit port (IOIS16) function. I/O is 16 bits. IOIS16 applies to 16-bit I/O PC Cards. IOIS16 is asserted by the 16-bit PC Card when the address on the bus corresponds to an address to which the 16-bit PC Card responds, and the I/O port that is addressed is capable of 16-bit accesses. DMA request. WP can be used as the DMA request signal during DMA operations to a 16-bit PC Card that supports DMA. If used, the PC Card asserts WP to indicate a request for a DMA operation.
VS1 VS2	134 122	68 56	I/O	Voltage sense 1 and voltage sense 2. VS1 and VS2, when used in conjunction with each other, determine the operating voltage of the 16-bit PC Card.

† Terminal name for slot A is preceded with A_. For example, the full name for terminal 110 is A_WE.

‡ Terminal name for slot B is preceded with B_. For example, the full name for terminal 46 is B_WE.

POST OFFICE BOX 655303 • DALLAS, TEXAS 75265

Terminal Functions (Continued)

CardBus PC Card interface system (slots A and B)

TERMINAL NAME	NO.		I/O TYPE	FUNCTION
	SLOT A†	SLOT B‡		
CCLK	112	48	O	CardBus PC Card clock. CCLK provides synchronous timing for all transactions on the CardBus interface. All signals except CRST, CCLKRUN, CINT, CSTSCHG, CAUDIO, CCD2:1, and CVS2–CVS1 are sampled on the rising edge of CCLK, and all timing parameters are defined with the rising edge of this signal. CCLK operates at the PCI bus clock frequency, but it can be stopped in the low state or slowed down for power savings.
CCLKRUN	139	73	O	CardBus PC Card clock run. CCLKRUN is used by a CardBus PC Card to request an increase in the CCLK frequency, and by the PCI1220 to indicate that the CCLK frequency is going to be decreased.
CRST	124	58	I/O	CardBus PC Card reset. CRST is used to bring CardBus PC Card-specific registers, sequencers, and signals to a known state. When CRST is asserted, all CardBus PC Card signals must be 3-stated, and the PCI1220 drives these signals to a valid logic level. Assertion can be asynchronous to CCLK, but deassertion must be synchronous to CCLK.

† Terminal name for slot A is preceded with A_. For example, the full name for terminal 112 is A_CCLK.

‡ Terminal name for slot B is preceded with B_. For example, the full name for terminal 48 is B_CCLK.

CardBus PC Card address and data (slots A and B)

TERMINAL NAME	NO.		I/O TYPE	FUNCTION
	SLOT A†	SLOT B‡		
CAD31	147	81	I/O	PC Card address and data. These signals make up the multiplexed CardBus address and data bus on the CardBus interface. During the address phase of a CardBus cycle, CAD31–CAD0 contain a 32-bit address. During the data phase of a CardBus cycle, CAD31–CAD0 contain data. CAD31 is the most-significant bit.
CAD30	145	79		
CAD29	144	78

CAD1	85	19		
CAD0	83	17		
CC/BE3 CC/BE2 CC/BE1 CC/BE0	130 117 104 94	63 52 39 28	I/O	CardBus bus commands and byte enables. CC/BE3–CC/BE0 are multiplexed on the same CardBus terminals. During the address phase of a CardBus cycle, CC/BE3–CC/BE0 defines the bus command. During the data phase, this 4-bit bus is used as byte enables. The byte enables determine which byte paths of the full 32-bit data bus carry meaningful data. CC/BE0 applies to byte 0 (CAD7–CAD0), CC/BE1 applies to byte 1 (CAD15–CAD8), CC/BE2 applies to byte 2 (CAD23–CAD8), and CC/BE3 applies to byte 3 (CAD31–CAD24).
CPAR	106	41	I/O	CardBus parity. In all CardBus read and write cycles, the PCI1220 calculates even parity across the CAD and CC/BE buses. As an initiator during CardBus cycles, the PCI1220 outputs CPAR with a one-CCLK delay. As a target during CardBus cycles, the calculated parity is compared to the initiator's parity indicator; a compare error results in a parity error assertion.

† Terminal name for slot A is preceded with A_. For example, the full name for terminal 106 is A_CPAR.

‡ Terminal name for slot B is preceded with B_. For example, the full name for terminal 41 is B_CPAR.

Terminal Functions (Continued)

CardBus PC Card interface control (slots A and B)

TERMINAL		NO.	I/O TYPE	FUNCTION
NAME	SLOT AT			
CAUDIO	137	71	I	CardBus audio. CAUDIO is a digital input signal from a PC Card to the system speaker. The PCI1220 supports the binary audio mode and outputs a binary signal from the card to SPKROUT.
$\overline{\text{CBLOCK}}$	107	42	I/O	CardBus lock. $\overline{\text{CBLOCK}}$ is used to gain exclusive access to a target.
$\overline{\text{CCD1}}$ $\overline{\text{CCD2}}$	82 140	16 74	I	CardBus detect 1 and CardBus detect 2. $\overline{\text{CCD1}}$ and $\overline{\text{CCD2}}$ are used in conjunction with CVS1 and CVS2 to identify card insertion and interrogate cards to determine the operating voltage and card type.
$\overline{\text{CDEVSEL}}$	111	47	I/O	CardBus device select. The PCI1220 asserts $\overline{\text{CDEVSEL}}$ to claim a CardBus cycle as the target device. As a CardBus initiator on the bus, the PCI1220 monitors $\overline{\text{CDEVSEL}}$ until a target responds. If no target responds before timeout occurs, the PCI1220 terminates the cycle with an initiator abort.
$\overline{\text{CFRAME}}$	116	51	I/O	CardBus cycle frame. $\overline{\text{CFRAME}}$ is driven by the initiator of a CardBus bus cycle. $\overline{\text{CFRAME}}$ is asserted to indicate that a bus transaction is beginning, and data transfers continue while this signal is asserted. When $\overline{\text{CFRAME}}$ is deasserted, the CardBus bus transaction is in the final data phase.
$\overline{\text{CGNT}}$	110	46	I	CardBus bus grant. $\overline{\text{CGNT}}$ is driven by the PCI1220 to grant a CardBus PC Card access to the CardBus bus after the current data transaction has been completed.
$\overline{\text{CINT}}$	135	69	I	CardBus interrupt. $\overline{\text{CINT}}$ is asserted low by a CardBus PC Card to request interrupt servicing from the host.
$\overline{\text{CIRDY}}$	115	50	I/O	CardBus initiator ready. $\overline{\text{CIRDY}}$ indicates the CardBus initiator's ability to complete the current data phase of the transaction. A data phase is completed on a rising edge of CCLK when both $\overline{\text{CIRDY}}$ and $\overline{\text{CTRDY}}$ are asserted. Until $\overline{\text{CIRDY}}$ and $\overline{\text{CTRDY}}$ are both sampled asserted, wait states are inserted.
$\overline{\text{CPERR}}$	108	43	I/O	CardBus parity error. $\overline{\text{CPERR}}$ is used to report parity errors during CardBus transactions, except during special cycles. It is driven low by a target two clocks following that data when a parity error is detected.
$\overline{\text{CREQ}}$	127	61	I	CardBus request. $\overline{\text{CREQ}}$ indicates to the arbiter that the CardBus PC Card desires use of the CardBus bus as an initiator.
$\overline{\text{CSERR}}$	136	70	I	CardBus system error. $\overline{\text{CSERR}}$ reports address parity errors and other system errors that could lead to catastrophic results. $\overline{\text{CSERR}}$ is driven by the card synchronous to CCLK, but deasserted by a weak pullup, and may take several CCLK periods. The PCI1220 can report $\overline{\text{CSERR}}$ to the system by assertion of $\overline{\text{SERR}}$ on the PCI interface.
$\overline{\text{CSTOP}}$	109	45	I/O	CardBus stop. $\overline{\text{CSTOP}}$ is driven by a CardBus target to request the initiator to stop the current CardBus transaction. $\overline{\text{CSTOP}}$ is used for target disconnects, and is commonly asserted by target devices that do not support burst data transfers.
CSTSCHG	138	72	I	CardBus status change. CSTSCHG is used to alert the system to a change in the card's status, and is used as a wake-up mechanism.
$\overline{\text{CTRDY}}$	114	49	I/O	CardBus target ready. $\overline{\text{CTRDY}}$ indicates the CardBus target's ability to complete the current data phase of the transaction. A data phase is completed on a rising edge of CCLK, when both $\overline{\text{CIRDY}}$ and $\overline{\text{CTRDY}}$ are asserted; until this time, wait states are inserted.
CVS1 CVS2	134 122	68 56	I/O	CardBus voltage sense 1 and CardBus voltage sense 2. CVS1 and CVS2 are used in conjunction with $\overline{\text{CCD1}}$ and $\overline{\text{CCD2}}$ to identify card insertion and interrogate cards to determine the operating voltage and card type.

† Terminal name for slot A is preceded with A_. For example, the full name for terminal 137 is A_CAUDIO.

‡ Terminal name for slot B is preceded with B_. For example, the full name for terminal 71 is B_CAUDIO.

PCI1220 PC CARD CONTROLLER

XCPS016 – DECEMBER 1997

absolute maximum ratings over operating temperature ranges (unless otherwise noted)†

Supply voltage range, V_{CC}	–0.5 V to 4.6 V
Supply voltage range, V_{CCP} , V_{CCA} , V_{CCB} , V_{CCI}	–0.5 V to 6 V
Input voltage range, V_I : PCI	–0.5 V to $V_{CCP} + 0.5$ V
Card A	–0.5 to $V_{CCA} + 0.5$ V
Card B	–0.5 to $V_{CCB} + 0.5$ V
MISC	–0.5 to $V_{CCI} + 0.5$ V
Fail safe	–0.5 V to $V_{CC} + 0.5$ V
Output voltage range, V_O : PCI	–0.5 V to $V_{CCP} + 0.5$ V
Card A	–0.5 to $V_{CCA} + 0.5$ V
Card B	–0.5 to $V_{CCB} + 0.5$ V
MISC	–0.5 to $V_{CCI} + 0.5$ V
Fail safe	–0.5 V to $V_{CC} + 0.5$ V
Input clamp current, I_{IK} ($V_I < 0$ or $V_I > V_{CC}$) (see Note 1)	±20 mA
Output clamp current, I_{OK} ($V_O < 0$ or $V_O > V_{CC}$) (see Note 2)	±20 mA
Storage temperature range, T_{stg}	–65°C to 150°C
Virtual junction temperature, T_J	150°C

† Stresses beyond those listed under “absolute maximum ratings” may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under “recommended operating conditions” is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

- NOTES: 1. Applies for external input and bidirectional buffers. $V_I > V_{CC}$ does not apply to fail-safe terminals. PCI terminals are measured with respect to V_{CCP} instead of V_{CC} . PC Card terminals are measured with respect to V_{CCA} or V_{CCB} . Miscellaneous signals are measured with respect to V_{CCI} . The limit specified applies for a dc condition.
2. Applies for external output and bidirectional buffers. $V_O > V_{CC}$ does not apply to fail-safe terminals. PCI terminals are measured with respect to V_{CCP} instead of V_{CC} . PC Card terminals are measured with respect to V_{CCA} or V_{CCB} . Miscellaneous signals are measured with respect to V_{CCI} . The limit specified applies for a dc condition.

t_{dis}	Disable time, active-to-high impedance delay time from PCLK	t_{off}			28	ns
t_{su}	Setup time before PCLK valid	t_{su}		7		ns
t_h	Hold time after PCLK high	t_h		0		ns

- NOTES: 4. PCI shared signals are $\overline{\text{AD31-0}}$, $\overline{\text{C/BE3-0}}$, $\overline{\text{FRAME}}$, $\overline{\text{TRDY}}$, $\overline{\text{IRDY}}$, $\overline{\text{STOP}}$, $\overline{\text{IDSEL}}$, $\overline{\text{DEVSEL}}$, and $\overline{\text{PAR}}$.
5. This data sheet uses the following conventions to describe time (t) intervals. The format is t_A , where *subscript A* indicates the type of dynamic parameter being represented. One of the following is used: t_{pd} = propagation delay time, t_d = delay time, t_{su} = setup time, and t_h = hold time.

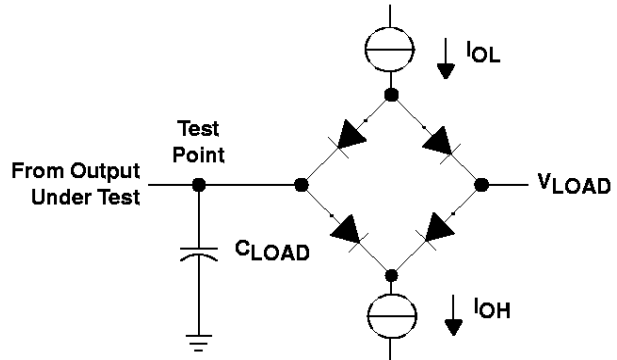

PARAMETER MEASUREMENT INFORMATION

LOAD CIRCUIT PARAMETERS

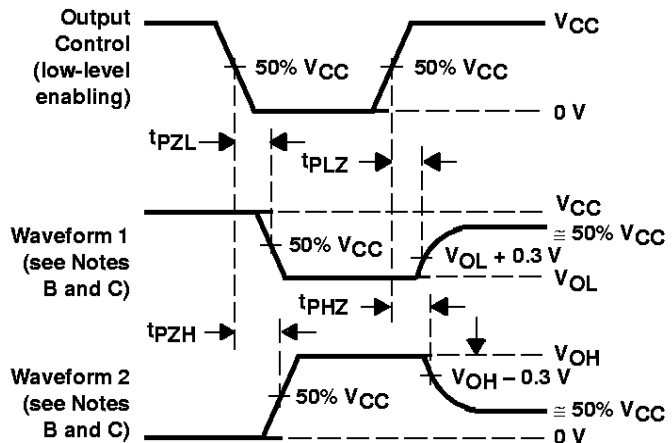

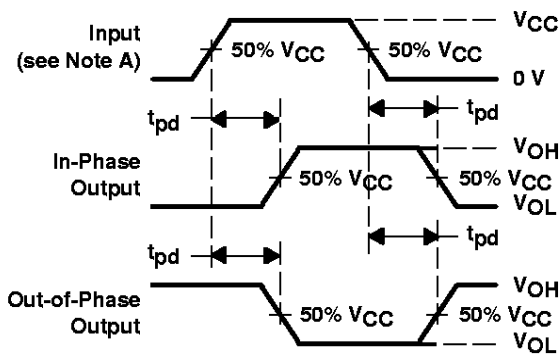

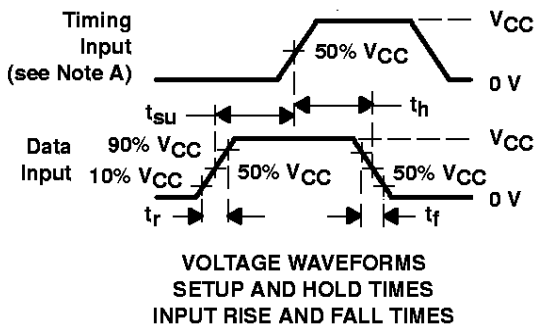

TIMING PARAMETER		C _{LOAD} † (pF)	I _{OL} (mA)	I _{OH} (mA)	V _{LOAD} (V)
t _{en}	t _{PZH}	50	8	-8	0
	t _{PZL}				3
t _{dis}	t _{PHZ}	50	8	-8	1.5
	t _{PLZ}				
t _{pd}		50	8	-8	‡

† C_{LOAD} includes the typical load-circuit distributed capacitance

‡ $\frac{V_{LOAD} - V_{OL}}{I_{OL}} = 50 \Omega$, where V_{OL} = 0.6 V, I_{OL} = 8 mA

LOAD CIRCUIT

- NOTES: A. Phase relationships between waveforms were chosen arbitrarily. All input pulses are supplied by pulse generators having the following characteristics: PRR = 1 MHz, Z_O = 50 Ω, t_r = 6 ns.
B. Waveform 1 is for an output with internal conditions such that the output is low except when disabled by the output control. Waveform 2 is for an output with internal conditions such that the output is high except when disabled by the output control.
C. For t_{PLZ} and t_{PHZ}, V_{OL} and V_{OH} are measured values.

PCI BUS PARAMETER MEASUREMENT INFORMATION

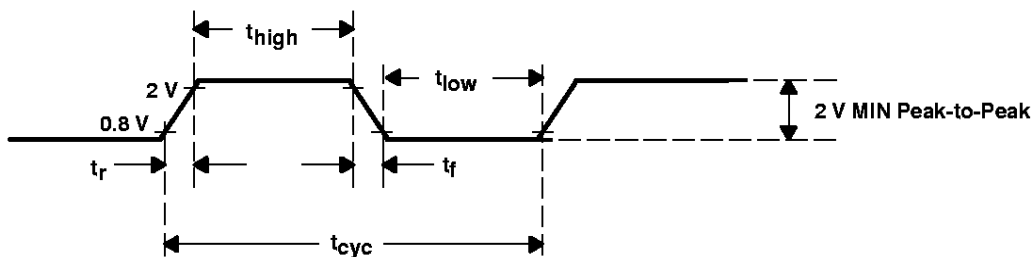

Figure 2. PCLK Timing Waveform

Figure 3. $\overline{\text{RSTIN}}$ Timing Waveforms

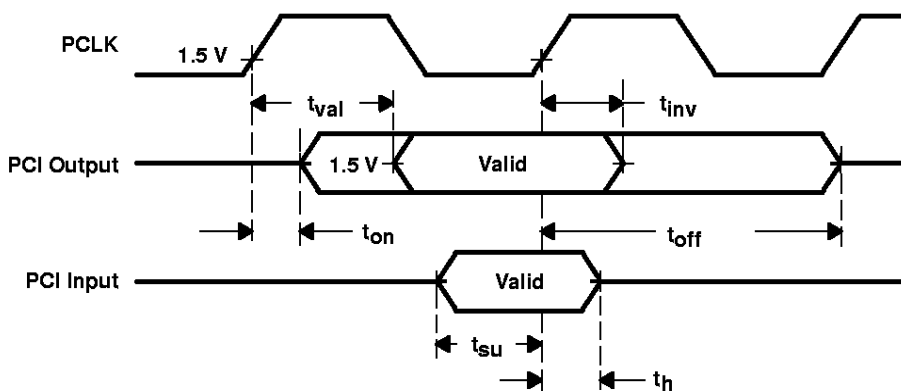

Figure 4. Shared Signals Timing Waveforms

PC Card cycle timing

The PC Card cycle timing is controlled by the wait-state bits in the Intel 82365SL-DF compatible memory and I/O window registers. The PC Card cycle generator uses the PCI clock to generate the correct card address setup and hold times and the PC Card command active (low) interval. This allows the cycle generator to output PC Card cycles that are as close to the Intel 82365SL-DF timing as possible while always slightly exceeding the Intel 82365SL-DF values. This ensures compatibility with existing software and maximizes throughput.

The PC Card address setup and hold times are a function of the wait-state bits. Table 1 shows address setup time in PCLK cycles and nanoseconds for I/O and memory cycles. Table 2 and Table 3 show command active time in PCLK cycles and nanoseconds for I/O and memory cycles. Table 4 shows address hold time in PCLK cycles and nanoseconds for I/O and memory cycles.

Table 1. PC Card Address Setup Time, $t_{su(A)}$, 8-Bit and 16-Bit PCI Cycles

WAIT-STATE BITS			TS1 – 0 = 01 (PCLK/ns)
I/O			3/90
Memory	WS1	0	2/60
Memory	WS1	1	4/120

Table 2. PC Card Command Active Time, $t_{c(A)}$, 8-Bit PCI Cycles

	WAIT-STATE BITS		TS1 – 0 = 01 (PCLK/ns)
	WS	ZWS	
I/O	0	0	19/570
	1	X	23/690
	0	1	7/210
Memory	00	0	19/570
	01	X	23/690
	10	X	23/690
	11	X	23/690
	00	1	7/210

Table 3. PC Card Command Active Time, $t_{c(A)}$, 16-Bit PCI Cycles

	WAIT-STATE BITS		TS1 – 0 = 01 (PCLK/ns)
	WS	ZWS	
I/O	0	0	7/210
	1	X	11/330
	0	1	N/A
Memory	00	0	9/270
	01	X	13/390
	10	X	17/510
	11	X	23/630
	00	1	5/150

Table 4. PC Card Address Hold Time, $t_{h(A)}$, 8-Bit and 16-Bit PCI Cycles

WAIT-STATE BITS			TS1 – 0 = 01 (PCLK/ns)
I/O			2/60
Memory	WS1	0	2/60
Memory	WS1	1	3/90

timing requirements over recommended ranges of supply voltage and operating free-air temperature, memory cycles (for 100-ns common memory) (see Note 5 and Figure 5)

	ALTERNATE SYMBOL	MIN	MAX	UNIT
t_{su} Setup time, $\overline{CE1}$ and $\overline{CE2}$ before $\overline{WE/OE}$ low	T1	60		ns
t_{su} Setup time, CA25–CA0 before $\overline{WE/OE}$ low	T2	$t_{su(A)}+2PCLK$		ns
t_{su} Setup time, \overline{REG} before $\overline{WE/OE}$ low	T3	90		ns
t_{pd} Propagation delay time, $\overline{WE/OE}$ low to \overline{WAIT} low	T4			ns
t_w Pulse duration, $\overline{WE/OE}$ low	T5	200		ns
t_h Hold time, $\overline{WE/OE}$ low after \overline{WAIT} high	T6			ns
t_h Hold time, $\overline{CE1}$ and $\overline{CE2}$ after $\overline{WE/OE}$ high	T7	120		ns
t_{su} Setup time (read), CDATA15–CDATA0 valid before \overline{OE} high	T8			ns
t_h Hold time (read), CDATA15–CDATA0 valid after \overline{OE} high	T9	0		ns
t_h Hold time, CA25–CA0 and \overline{REG} after $\overline{WE/OE}$ high	T10	$t_{h(A)}+1PCLK$		ns
t_{su} Setup time (write), CDATA15–CDATA0 valid before \overline{WE} low	T11	60		ns
t_h Hold time (write), CDATA15–CDATA0 valid after \overline{WE} low	T12	240		ns

NOTE 6: These times are dependent on the register settings associated with ISA wait states and data size. They are also dependent on cycle type (read/write, memory/I/O) and \overline{WAIT} from PC Card. The times listed here represent absolute minimums (the times that would be observed if programmed for zero wait state, 16-bit cycles) with a 33-MHz PCI clock.

timing requirements over recommended ranges of supply voltage and operating free-air temperature, I/O cycles (see Figure 6)

IMPORTANT NOTICE

Texas Instruments (TI) reserves the right to make changes to its products or to discontinue any semiconductor product or service without notice, and advises its customers to obtain the latest version of relevant information to verify, before placing orders, that the information being relied on is current.

TI warrants performance of its semiconductor products and related software to the specifications applicable at the time of sale in accordance with TI's standard warranty. Testing and other quality control techniques are utilized to the extent TI deems necessary to support this warranty. Specific testing of all parameters of each device is not necessarily performed, except those mandated by government requirements.

Certain applications using semiconductor products may involve potential risks of death, personal injury, or severe property or environmental damage ("Critical Applications").

TI SEMICONDUCTOR PRODUCTS ARE NOT DESIGNED, INTENDED, AUTHORIZED, OR WARRANTED TO BE SUITABLE FOR USE IN LIFE-SUPPORT APPLICATIONS, DEVICES OR SYSTEMS OR OTHER CRITICAL APPLICATIONS.

Inclusion of TI products in such applications is understood to be fully at the risk of the customer. Use of TI products in such applications requires the written approval of an appropriate TI officer. Questions concerning potential risk applications should be directed to TI through a local SC sales office.

In order to minimize risks associated with the customer's applications, adequate design and operating safeguards should be provided by the customer to minimize inherent or procedural hazards.

TI assumes no liability for applications assistance, customer product design, software performance, or infringement of patents or services described herein. Nor does TI warrant or represent that any license, either express or implied, is granted under any patent right, copyright, mask work right, or other intellectual property right of TI covering or relating to any combination, machine, or process in which such semiconductor products or services might be or are used.
