+10V PRECISION
VOLTAGE REFERENCE

Precision Monolithics Inc.

FEATURES

- 10 Volt Output $\pm 0.3\%$ Max
- Adjustment Range $\pm 3\%$ Min
- Excellent Temperature Stability 8.5ppm/ $^{\circ}$ C Max
- Low Noise $30\mu\text{V}_{\text{p-p}}$ Max
- Low Supply Current 1.4mA Max
- Wide Input Voltage Range 12V to 40V
- High Load-Driving Capability 20mA
- No External Components
- Short-Circuit Proof
- MIL-STD-883 Screening Available
- Available in Die Form

+10V output which can be adjusted over a $\pm 3\%$ range with minimal effect on temperature stability. Single-supply operation over an input voltage range of 12V to 40V, low current drain of 1mA, and excellent temperature stability are achieved with an improved bandgap design. Low cost, low noise, and low power make the REF-01 an excellent choice whenever a stable voltage reference is required. Applications include D/A and A/D converters, portable instrumentation, and digital voltmeters. Full military temperature range devices with screening to MIL-STD-883 are available. For guaranteed long-term drift see the REF-10 data sheet.

NOTES:

- ΔV_{OT} is defined as the absolute difference between the maximum output voltage and the minimum output voltage over the specified temperature range expressed as a percentage of 10V:

$$\Delta V_{OT} = \left| \frac{V_{MAX} - V_{MIN}}{10V} \right| \times 100$$

- ΔV_{OT} specification applies trimmed to +10.000V or untrimmed.
- TCV_O is defined as ΔV_{OT} divided by the temperature range, i.e.,

$$TCV_O (0^\circ \text{ to } +70^\circ C) = \frac{\Delta V_{OT} (0^\circ \text{ to } +70^\circ C)}{70^\circ C}$$

$$\text{and } TCV_O (-55^\circ \text{ to } +125^\circ C) = \frac{\Delta V_{OT} (-55^\circ \text{ to } +125^\circ C)}{180^\circ C}$$

- Line and Load Regulation specifications include the effect of self heating.
- Guaranteed by design.
- Sample tested.
- During sink current test the device meets the output voltage specified.

OUTPUT ADJUSTMENT

The REF-01 trim terminal can be used to adjust the output voltage over a $10V \pm 300mV$ range. This feature allows the system designer to trim system errors by setting the reference to a voltage other than 10V. Of course, the output can

BURN-IN CIRCUIT

also be set to exactly 10.000V, or to 10.240V for binary applications.

Adjustment of the output does not significantly affect the temperature performance of the device. The temperature coefficient change is approximately 0.7 ppm/ $^\circ C$ for 100mV of output adjustment.

NOTE:

Electrical tests are performed at wafer probe to the limits shown. Due to variations in assembly methods and normal yield loss, yield after packaging is not guaranteed for standard product dice. Consult factory to negotiate specifications based on dice lot qualification through sample lot assembly and testing.

PRECISION CURRENT SOURCE

A current source with 25V output compliance and excellent output impedance can be obtained using this circuit. REF-01 (2) keeps the line voltage and power dissipation constant in device (1); the only important error consideration at room temperature is the negative supply rejection of the op amp. The typical $3\mu\text{V}/\text{V}$ PSRR of the OP-02E will create an 8ppm change ($3\mu\text{V}/\text{V} \times 25\text{V}/10\text{V}$) in output current over a 25V range. For example, a 10mA current source can be built ($R = 1\text{k}\Omega$) with $300\text{M}\Omega$ output impedance.

$$R_O = \frac{25\text{V}}{8 \times 10^{-6} \times 10\text{mA}}$$

SUPPLY BYPASSING

For best results, it is recommended that the power supply pin is bypassed with a 0.1 μF disc ceramic capacitor.

REFERENCE STACK WITH EXCELLENT LINE REGULATION

Three REF-01's can be stacked to yield 10.000, 20.000, and 30.000V outputs. An additional advantage is near-perfect line regulation of the 10.0V and 20.0V output. A 32V to 60V input change produces an output change which is less than the noise voltage of the devices. A load bypass resistor (R_B) provides a path for the supply current (I_{SY}) of the 20.000V regulator.

In general, any number of REF-01's can be stacked this way. For example, ten devices will yield outputs of 10, 20, 30 . . . 100V. The line voltage can range from 105V to 130V. However, care must be taken to ensure that the total load currents do not exceed the maximum usable current (typically 21mA).
