## www.maxim-ic.com

## FEATURES

- Complete E1 (CEPT) PCM-30/ISDN-PRI Transceiver Functionality
- On-Board Line Interface for Clock/Data Recovery and Waveshaping
- 32-Bit or 128 -Bit Jitter Attenuator
- Generates Line Build-Outs for Both $120 \Omega$ and $75 \Omega$ Lines
- Frames to FAS, CAS, and CRC4 Formats
- Dual On-Board Two-Frame Elastic Store Slip Buffers That can Connect to Backplanes Up to 8.192 MHz
- 8-Bit Parallel Control Port That can be Used on Either Multiplexed or Nonmultiplexed Buses
- Extracts and Inserts CAS Signaling
- Detects and Generates Remote and AIS Alarms
- Programmable Output Clocks for Fractional E1, H0, and H12 Applications
- Fully Independent Transmit and Receive Functionality
- Full Access to Both Si and Sa Bits
- Three Separate Loopbacks for Testing
- Large Counters for Bipolar and Code Violations, CRC4 Codeword Errors, FAS Errors, and E Bits
- Pin Compatible with DS2151Q T1 SingleChip Transceiver
- 5V Supply; Low-Power CMOS

ORDERING INFORMATION

| PART | TEMP <br> RANGE | PIN- <br> PACKAGE |
| :--- | :---: | :--- |
| DS2153Q | $0^{\circ} \mathrm{C}$ to $+70^{\circ} \mathrm{C}$ | 44 PLCC |
| DS2153Q + | $0^{\circ} \mathrm{C}$ to $+70^{\circ} \mathrm{C}$ | 44 PLCC |
| DS2153QN | $-40^{\circ} \mathrm{C}$ to $+85^{\circ} \mathrm{C}$ | 44 PLCC |
| DS2153QN + | $-40^{\circ} \mathrm{C}$ to $+85^{\circ} \mathrm{C}$ | 44 PLCC |

+ Denotes lead-free/RoHS-compliant package.

## PIN CONFIGURATION

Note: Some revisions of this device may incorporate deviations from published specifications known as errata. Multiple revisions of any device may be simultaneously available through various sales channels. For information about device errata, click here: www.maxim-ic.com/errata.

## 1 DETAILED DESCRIPTION

The DS2153Q E1 single-chip transceiver (SCT) contains all the necessary functions for connection to E1 lines. The on-board clock/data recovery circuitry coverts the AMI/HDB3 E1 waveforms to a NRZ serial stream. The DS2153Q automatically adjusts to E1 22 AWG ( 0.6 mm ) twisted-pair cables from 0 to 1.5 km . The device can generate the necessary G. 703 waveshapes for both $75 \Omega$ and $120 \Omega$ cables. The on-board jitter attenuator (selectable to either 32 bits or 128 bits) can be placed in either the transmit or receive data paths. The framer locates the frame and multiframe boundaries and monitors the data stream for alarms. It is also used for extracting and inserting signaling data, Si , and Sa -bit information. The device contains a set of 718 -bit internal registers that the user can access to control the operation of the unit. Quick access via the parallel control port allows a single micro to handle many E1 lines. The device fully meets all the latest E1 specifications, including ITU G.703, G.704, G.706, G.823, and I. 431 as well as ETSI 300 011, 300 233, TBR 12 and TBR 13.

### 1.1 Introduction

The analog AMI waveform off of the E1 line is transformer coupled into the RRING and RTIP pins of the DS2153Q. The device recovers clock and data from the analog signal and passes it through the jitter attenuation mux to the receive side framer where the digital serial stream is analyzed to locate the framing pattern. If needed, the receive side elastic store can be enabled in order to absorb the phase and frequency differences between the recovered E1 data stream and an asynchronous backplane clock which is provided at the SYSCLK input.

The transmit side of the DS2153Q is totally independent from the receive side in both the clock requirements and characteristics. The transmit formatter will provide the necessary data overhead for E1 transmission. Once the data stream has been prepared for transmission, it is sent via the jitter attenuation mux to the waveshaping and line driver functions. The DS2153Q will drive the E1 line from the TTIP and TRING pins via a coupling transformer.

### 1.2 Reader's Note

This data sheet assumes a particular nomenclature of the E1 operating environment. There are 328 -bit time slots in E1 systems that are numbered 0 to 31 . Time slot 0 is transmitted first and received first. These 32 time slots are also referred to as channels with a numbering scheme of 1 to 32 . Time slot 0 is identical to channel 1, time slot 1 is identical to channel 2, and so on. Each time slot (or channel) is made up of 8 bits numbered 1 to 8 . Bit number 1 is the MSB and is transmitted first. Bit number 8 is the LSB and is transmitted last. Throughout this data sheet, the following abbreviations are used:

| FAS | Frame Alignment Signal |
| :--- | :--- |
| CAS | Channel Associated Signaling |
| MF | Multiframe |
| Si | International Bits |
| CRC 4 | Cyclical Redundancy Check |
| CCS | Common Channel Signaling |
| Sa | Additional bits |
| $\mathrm{E}-\mathrm{bit}$ | CRC4 Error bits |

Figure 1-1. DS2153Q Block Diagram

## 2 PIN DESCRIPTION

| PIN | NAME | TYPE | FUNCTION |
| :---: | :---: | :---: | :---: |
| $\begin{gathered} 1-4, \\ 41-44 \end{gathered}$ | $\begin{aligned} & \hline \text { AD4-AD7, } \\ & \text { AD0-AD3 } \end{aligned}$ | I/O | Address/Data Bus. An 8-bit multiplexed address/data bus. |
| 5 | $\overline{\mathrm{RD}}$ (DS) | I | Active-Low Read Input (Data Strobe) |
| 6 | CS | I | Active-Low Chip Select. Must be low to read or write the port. |
| 7 | ALE(AS) | I | Address Latch Enable (Address Strobe). A positive going edge serves to demultiplex the bus. |
| 8 | $\overline{\mathrm{WR}}(\mathrm{R} / \overline{\mathrm{W}})$ | I | Active-Low Write Input (Read/Write) |
| 9 | RLINK | O | Receive Link Data. Outputs the full receive data stream including the Sa bits. See Section 14 for timing details. |
| 10 | RLCLK | O | Receive Link Clock. 4 kHz to 20 kHz demand clock for the RLINK output. Controlled by RCR2. See Section 14 for timing details. |
| 11 | DVSS | - | Digital Signal Ground. 0.0V. Should be tied to local ground plane. |
| 12 | RCLK | O | Receive Clock. Recovered 2.048MHz clock. |
| 13 | RCHCLK | O | Receive Channel Clock. 256 kHz clock that pulses high during the LSB of each channel. Useful for parallel to serial conversion of channel data. See Section 14 for timing details. |
| 14 | RSER | O | Receive Serial Data. Received NRZ serial data, updated on rising edges of RCLK or SYSCLK. |
| 15 | RSYNC | I/O | Receive Sync. An extracted pulse, one RCLK wide, is output at this pin, which identifies either frame ( $\mathrm{RCR} 1.6=0$ ) or multiframe boundaries (RCR1.6 = 1). If the elastic store is enabled via the RCR2.1, then this pin can be enabled to be an input via RCR1.5 at which a frame boundary pulse is applied. See Section $\underline{14}$ for timing details. |
| 16 | RLOS/LOTC | O | Receive Loss of Sync/Loss of Transmit Clock. A dual function output. If TCR2.0 $=0$, will toggle high when the synchronizer is searching for the E1 frame and multiframe; if TCR2.0 $=1$, will toggle high if the TCLK pin has not toggled for $5 \mu \mathrm{~s}$. |
| 17 | SYSCLK | I | System Clock. 1.544 MHz or 2.048 MHz clock. Only used when the elastic store functions are enabled via either RCR2.1. Should be tied low in applications that do not use the elastic store. If tied high for at least $100 \mu \mathrm{~s}$, will force all output pins (including the parallel port) to tri-state. |
| 18 | RCHBLK | O | Receive Channel Block. A user-programmable output that can be forced high or low during any of the 32 E1 channels. Useful for blocking clocks to a serial UART or LAPD controller in applications where not all E1 channels are used such as Fractional E1, 384kbps service (H0), 1920kbps (H12), or ISDN-PRI. Also useful for locating individual channels in drop-and-insert applications. See Section $\underline{14}$ for timing details. |
| 19 | ACLKI | I | Alternate Clock Input. Upon a receive carrier loss, the clock applied at this pin (normally 2.048 MHz ) will be routed to the RCLK pin. If no clock is routed to this pin, then it should be tied to DVSS via a $1 \mathrm{k} \Omega$ resistor. |

| PIN | NAME | TYPE | FUNCTION |
| :---: | :---: | :---: | :---: |
| 20 | BTS | I | Bus Type Select. Strap high to select Motorola bus timing; strap low to select Intel bus timing. This pin controls the function of the $\overline{\mathrm{RD}}(\mathrm{DS})$, $\operatorname{ALE}(\mathrm{AS})$, and $\overline{\mathrm{WR}}(\mathrm{R} / \overline{\mathrm{W}})$ pins. If $\mathrm{BTS}=1$, then these pins assume the function listed in parentheses (). |
| 21, 22 | RTIP, <br> RRING | - | Receive Tip and Ring. Analog inputs for clock recovery circuitry; connects to a $1: 1$ transformer (see Section 13 for details). |
| 23 | RVDD | - | Receive Analog Positive Supply. 5.0V. Should be tied to DVDD and TVDD pins. |
| 24 | RVSS | - | Receive Signal Ground. 0V. Should be tied to local ground plane. |
| 25, 26 | XTAL1, <br> XTAL2 | - | Crystal Connections. A pullable 8.192 MHz crystal must be applied to these pins. See Section $\underline{13}$ for crystal specifications. |
| 27 | $\overline{\text { INT1 }}$ | O | Receive Alarm Interrupt 1. Flags host controller during alarm conditions defined in Status Register 1. Active low, open drain output. |
| 28 | $\overline{\text { INT2 }}$ | O | Receive Alarm Interrupt 2. Flags host controller during conditions defined in Status Register 2. Active low, open drain output. |
| 29 | TTIP | - | Transmit Tip. Analog line driver output; connects to a step-up transformer (see Section 13 for details). |
| 30 | TVSS | - | Transmit Signal Ground. 0V. Should be tied to local ground plane. |
| 31 | TVDD | - | Transmit Analog Positive Supply. 5.0V. Should be tied to DVDD and RVDD pins. |
| 32 | TRING | - | Transmit Ring. Analog line driver outputs; connects to a step-up transformer (see Section 13 for details). |
| 33 | TCHBLK | O | Transmit Channel Block. A user-programmable output that can be forced high or low during any of the 32 E1 channels. Useful for blocking clocks to a serial UART or LAPD controller in applications where not all E1 channels are used such as Fractional E1, 384kbps service (H0), 1920kbps (H12), or ISDN-PRI. Also useful for locating individual channels in drop-and-insert applications. See Section $\underline{14}$ for timing details. |
| 34 | TLCLK | O | Transmit Link Clock. 4 kHz to 20 kHz demand clock for the TLINK input. Controlled by TCR2. See Section 14 for timing details. |
| 35 | TLINK | I | Transmit Link Data. If enabled, this pin will be sampled on the falling edge of TCLK to insert the Sa bits. See Section $\underline{14}$ for timing details. |
| 36 | TSYNC | I/O | Transmit Sync. A pulse at this pin will establish either frame or multiframe boundaries for the DS2153Q. Via TCR1.1, the DS2153Q can be programmed to output either a frame or multiframe pulse at this pin. See Section 14 for timing details. |
| 37 | DVDD | - | Digital Positive Supply. 5.0V. Should be tied to RVDD and TVDD pins. |
| 38 | TCLK | I | Transmit Clock. 2.048MHz primary clock. |
| 39 | TSER | I | Transmit Serial Data. Transmit NRZ serial data, sampled on the falling edge of TCLK. |
| 40 | TCHCLK | O | Transmit Channel Clock. 256 kHz clock that pulses high during the LSB of each channel. Useful for parallel to serial conversion of channel data. See Section $\underline{14}$ for timing details. |

### 2.1 DS2153Q Register Map

| ADDRESS | R/W | REGISTER NAME | ADDRESS | R/W | REGISTER NAME |

| 13 | R/W | Transmit Control 2 | 2 C | R/W | Receive Channel Blocking 2 |
| 14 | R/W | Common Control 1 | 2E | R/W | Receive Channel Blocking 3 |
| 15 | R/W | Test 1 | 2E | R/W | Receive Channel Blocking 4 |
| 16 | R/W | Interrupt Mask 1 | 2F | R | Receive Align Frame |
| 17 | R/W | Interrupt Mask 2 | 30 | R | Receive Signaling 1 |
| 18 | R/W | Line Interface Control | 31 | R | Receive Signaling 2 |
| 19 | R/W | Test 2 | 32 | R | Receive Signaling 3 |
| 1A | R/W | Common Control 2 | 33 | R | Receive Signaling 4 |
| 1B | R/W | Common Control 3 | 34 | R | Receive Signaling 5 |
| 1 E | R | Synchronizer Status | 35 | R | Receive Signaling 6 |
| 1F | R | Receive Non-Align Frame | 36 | R | Receive Signaling 7 |
| 40 | R/W | Transmit Signaling 1 | 37 | R | Receive Signaling 8 |
| 41 | R/W | Transmit Signaling 2 | 38 | R | Receive Signaling 9 |
| 42 | R/W | Transmit Signaling 3 | 39 | R | Receive Signaling 10 |
| 43 | R/W | Transmit Signaling 4 | 3A | R | Receive Signaling 11 |
| 44 | R/W | Transmit Signaling 5 | 3B | R | Receive Signaling 12 |
| 45 | R/W | Transmit Signaling 6 | 3 C | R | Receive Signaling 13 |
| 46 | R/W | Transmit Signaling 7 | 3D | R | Receive Signaling 14 |
| 47 | R/W | Transmit Signaling 8 | 3E | R | Receive Signaling 15 |
| 48 | R/W | Transmit Signaling 9 | 3F | R | Receive Signaling 16 |
| 49 | R/W | Transmit Signaling 10 |  |  |  |
| 4A | R/W | Transmit Signaling 11 |  |  |  |
| 4B | R/W | Transmit Signaling 12 |  |  |  |
| 4C | R/W | Transmit Signaling 13 |  |  |  |
| 4D | R/W | Transmit Signaling 14 |  |  |  |
| 4E | R/W | Transmit Signaling 15 |  |  |  |
| 4F | R/W | Transmit Signaling 16 |  |  |  |

Note: Test Registers 1 and 2 are used only by the factory; these registers must be cleared (set to all 0s) on power-up initialization to ensure proper operation.

## 3 PARALLEL PORT

The DS2153Q is controlled via a multiplexed bidirectional address/data bus by an external microcontroller or microprocessor. The DS2153Q can operate with either Intel or Motorola bus timing configurations. If the BTS pin is tied low, Intel timing will be selected; if tied high, Motorola timing will be selected. All Motorola bus signals are listed in parentheses (). See the timing diagrams in Section 14 for more details. The multiplexed bus on the DS2153Q saves pins because the address information and data information share the same signal paths. The addresses are presented to the pins in the first portion of the bus cycle and data will be transferred on the pins during second portion of the bus cycle. Addresses must be valid prior to the falling edge of ALE (AS), at which time the DS2153Q latches the address from the AD0 to AD7 pins. Valid write data must be present and held stable during the later portion of the DS or $\overline{\mathrm{WR}}$ pulses. In a read cycle, the DS2153Q outputs a byte of data during the latter portion of the DS or $\overline{\mathrm{RD}}$ pulses. The read cycle is terminated and the bus returns to a high-impedance state as $\overline{\mathrm{RD}}$ transitions high in Intel timing or as DS transitions low in Motorola timing.

## 4 CONTROL AND TEST REGISTERS

The operation of the DS2153Q is configured via a set of seven registers. Typically, the control registers are only accessed when the system is first powered up. Once the DS2153Q has been initialized, the control registers only need to be accessed when there is a change in the system configuration. There are two Receive Control Registers (RCR1 and RCR2), two Transmit Control Registers (TCR1 and TCR2), and three Common Control Registers (CCR1, CCR2, and CCR3). Each of the seven registers is described in this section. The LICR is described in Section 13.

The Test Registers at addresses 15 and 19 hex are used by the factory in testing the DS2153Q. On powerup, the Test Registers should be set to 00 hex in order for the DS2153Q to operate properly.

RCR1: RECEIVE CONTROL REGISTER 1 (Address = 10B Hex)
(MSB)
(LSB)

| RSMF | RSM | RSIO | - | - | FRC | SYNCE | RESYNC |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |

| SYMBOL | POSITION | NAME AND DESCRIPTION |
| :---: | :---: | :---: |
| RSMF | RCR1.7 | RSYNC Multiframe Function. Only used if the RSYNC pin is programmed in the multiframe mode (RCR1.6 = 1). <br> $0=$ RSYNC outputs CAS multiframe boundaries <br> $1=$ RSYNC outputs CRC4 multiframe boundaries |
| RSM | RCR1.6 | RSYNC Mode Select. <br> $0=$ frame mode (see the timing in Section 14) <br> $1=$ multiframe mode (see the timing in Section 14) |
| RSIO | RCR1.5 | RSYNC I/O Select. <br> $0=$ RSYNC is an output (depends on RCR1.6) <br> $1=$ RSYNC is an input (only valid if elastic store enabled) (Note: this bit must be set to 0 when RCR2.1 = 0) |
| - | RCR1.4 | Not Assigned. Should be set to 0 when written. |
| - | RCR1.3 | Not Assigned. Should be set to 0 when written. |
| FRC | RCR1.2 | Frame Resync Criteria. <br> $0=$ resync if FAS received in error 3 consecutive times $1=$ resync if FAS or bit 2 of non-FAS is received in error 3 consecutive times |
| SYNCE | RCR1.1 | Sync Enable. <br> $0=$ auto resync enabled <br> $1=$ auto resync disabled |
| RESYNC | RCR1.0 | Resync. When toggled from low to high, a resync is initiated. Must be cleared and set again for a subsequent resync. |

Table 4-1. Sync/Resync Criteria

| FRAME OR MULTIFRAME LEVEL | SYNC CRITERIA | RESYNC CRITERIA | ITU SPEC |
| :---: | :---: | :---: | :---: |
| FAS | FAS present in frames N and $\mathrm{N}+2$, and FAS not present in frame $\mathrm{N}+1$. | Three consecutive incorrect FAS received. Alternate (RCR1.2 = 1) the above criteria is met or three consecutive incorrect bit 2 of non-FAS received. | $\begin{gathered} \text { G.706 } \\ 4.1 .1 \\ 4.1 .2 \end{gathered}$ |
| CRC4 | Two valid MF alignment words found within 8 ms . | 915 or more CRC4 codewords out of 1000 received in error. | $\begin{gathered} \hline \text { G. } 706 \\ 4.2 \\ 4.3 .2 \end{gathered}$ |
| CAS | Valid MF alignment word found and previous time slot 16 contains code other than all 0s. | Two consecutive MF alignment words received in error. | $\begin{gathered} \text { G. } 732 \\ 5.2 \end{gathered}$ |

## RCR2: RECEIVE CONTROL REGISTER 2 (Address = 11 Hex)

| Sa8S | Sa7S | Sa6S | Sa5S | Sa4S | RSCLKM | RESE | - |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | SYMBOL POSITION NAME AND DESCRIPTION

Sa8S $\quad$ RCR2. $\quad$ Sa8 Bit Select. Set to 1 to report the Sa8 bit at the RLINK pin; set to 0 to not report the Sa 8 bit.

Sa7S RCR2.6 Sa7 Bit Select. Set to 1to report the Sa7 bit at the RLINK pin; set to 0 to not report the Sa 7 bit.

Sa6S RCR2.5 Sa6 Bit Select. Set to 1 to report the Sa6 bit at the RLINK pin; set to 0 to not report the Sa 6 bit.

Sa5S RCR2.4 Sa5 Bit Select. Set to 1 to report the Sa5 bit at the RLINK pin; set to 0 to not report the Sa 5 bit.

RCR2.0 Not Assigned. Should be set to 0 when written.

TCR1: TRANSMIT CONTROL REGISTER 1 (Address = 12 Hex ) (MSB)

| - | TFPT | T16S | TUA1 | TSiS | TSA1 | TSM | TSIO |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

| :---: | :---: | :---: |
| TESE | CCR3.7 | Transmit Elastic Store Enable. <br> $0=$ elastic store is disabled <br> $1=$ elastic store is enabled |
| TCBFS | CCR3.6 | Transmit Channel Blocking Registers (TCBR) Function Select. <br> $0=$ TCBRs define the operation of the TCHBLK output pin <br> $1=$ TCBRs define which signaling bits are to be inserted |
| TIRFS | CCR3.5 | Transmit Idle Registers (TIR) Function Select. $0=$ TIRs define in which channels to insert idle code $1=$ TIRs define in which channels to insert data from RSER |
| ESR | CCR3.4 | Elastic Stores Reset. Setting this bit from a 1 to a 0 will force the elastic stores to a known depth. Should be toggled after SYSCLK has been applied and is stable. Must be set and cleared again for a subsequent reset. Do not leave this bit set high. |
| LIRST | CCR3.3 | Line Interface Reset. Setting this bit from a 0 to a 1 will initiate an internal reset that affects the slicer, AGC, clock recovery state machine, and jitter attenuator. Normally this bit is only toggled on power-up. Must be cleared and set again for a subsequent reset. |
| - | CCR3.2 | Not Assigned. Should be set to 0 when written. |
| TSCLKM | CCR3.1 | Transmit Backplane Clock Select. Must be set like RCR2.2. $\begin{aligned} & 0=1.544 \mathrm{MHz} \\ & 1=2.048 \mathrm{MHz} \end{aligned}$ |
| - | CCR3.0 | Not Assigned. Should be set to 0 when written. |

### 4.1 Local Loopback

When CCR2.0 is set to a 1, the DS2153Q will be forced into Local Loopback (LLB). In this loopback, data will continue to be transmitted as normal through the transmit side of the SCT. Data being received at RTIP and RRING will be replaced with the data being transmitted. Data in this loopback will pass through the jitter attenuator. See Figure 1-1 for more details.

### 4.2 Remote Loopback

When CCR2.1 is set to a 1, the DS2153Q will be forced into Remote Loopback (RLB). In this loopback, data recovered off the E1 line from the RTIP and RRING pins will be transmitted back onto the E1 line (with any BPVs that might have occurred intact) via the TTIP and TRING pins. Data will continue to pass through the receive side of the DS2153Q as it would normally and the data at the TSER input will be ignored. Data in this loopback will pass through the jitter attenuator. See Figure 1-1 for more details.

### 4.3 Framer Loopback

When CCR1.7 is set to a 1, the DS2153Q will enter a Framer Loopback (FLB) mode. This loopback is useful in testing and debugging applications. In FLB, the DS2153Q will loop data from the transmit side back to the receive side. When FLB is enabled, the following will occur:

1) Data will be transmitted at TTIP and TRING.
2) Data off the E1 line at RTIP and RRING will be ignored.

The RCLK output will be replaced with the TCLK input.

### 4.4 Automatic Alarm Generation

When either CCR2.4 or CCR2.5 is set to 1, the DS2153Q monitors the receive side to determine if any of the following conditions are present: loss of receive frame synchronization, AIS alarm (all 1s) reception, or loss of receive carrier (or signal). If any one (or more) of the above conditions is present, then the DS2153Q will either force an AIS alarm (if CCR2.5 = 1) or a Remote Alarm (CCR2.4 = 1) to be transmitted via the TTIP and TRING pins. It is an illegal state to have both CCR2.4 and CCR2.5 set to 1 at the same time.

### 4.5 Power-Up Sequence

On power-up, after the supplies are stable, the DS2153Q should be configured for operation by writing to all of the internal registers (this includes setting the Test Register) since the contents of the internal registers cannot be predicted on power-up. Next, the LIRST bit should be toggled from 0 to 1 to reset the line interface circuitry (it will take the DS2153Q about 40ms to recover from the LIRST being toggled). Finally, after the SYSCLK input is stable, the ESR bit should be toggled from a 0 to a 1 and back to 0 (this step can be skipped if the elastic stores are disabled).

## 5 STATUS AND INFORMATION REGISTERS

There is a set of four registers that contain information on the current real-time status of the DS2153Q: Status Register 1 (SR1), Status Register 2 (SR2), Receive Information Register (RIR), and Synchronizer Status Register (SSR). When a particular event has occurred (or is occurring), the appropriate bit in one of these four registers will be set to a 1 . All of the bits in these registers operate in a latched fashion (except for the SSR). This means that if an event occurs and a bit is set to a 1 in any of the registers, it will remain set until the user reads that bit. The bit will be cleared when it is read and it will not be set again until the event has occurred again or if the alarm is still present.

The user will always precede a read of the SR1, SR2, and RIR registers with a write. The byte written to the register will inform the DS2153Q which bits the user wishes to read and have cleared. The user will write a byte to one of these three registers, with a 1 in the bit positions he or she wishes to read and a 0 in the bit positions he or she does not wish to obtain the latest information on. When a 1 is written to a bit location, the read register will be updated with current value and it will be cleared. When a 0 is written to a bit position, the read register will not be updated and the previous value will be held. A write to the status and information registers will be immediately followed by a read of the same register. The read result should be logically ANDed with the mask byte that was just written and this value should be written back into the same register to insure that bit does indeed clear. This second write step is necessary because the alarms and events in the status registers occur asynchronously in respect to their access via the parallel port. This write-read-write scheme allows an external microcontroller or microprocessor to individually poll certain bits without disturbing the other bits in the register. This operation is key in controlling the DS2153Q with higher-order software languages.

The SSR register operates differently than the other three. It is a read-only register and it reports the status of the synchronizer in real time. This register is not latched and it is not necessary to precede a read of this register with a write.

The SR1 and SR2 registers have the unique ability to initiate a hardware interrupt via the INT1 and INT2 pins, respectively. Each of the alarms and events in the SR1 and SR2 can be either masked or unmasked from the interrupt pins via the Interrupt Mask Register 1 (IMR1) and Interrupt Mask Register 2 (IMR2), respectively.

\section*{SSR: SYNCHRONIZER STATUS REGISTER (Address = 1E Hex) (MSB) <br> CSC3 $\quad$ CSC2 $\quad$ CSC0 $\quad$ FASSA $\quad$ CASSA | CRC4SA |

| CSC2 | SSR. 4 | CRC4 Sync Counter Bit 2. |
| CSC0 | SSR. 3 | CRC4 Sync Counter Bit 0. LSB of the 6-bit counter. The next <br> to LSB bit is not accessible. This bit will toggle each time the <br> CRC4 MF search times out at 8ms. |
| FASSA | SSR. 2 | FAS Sync Active. Set while the synchronizer is searching for <br> alignment at the FAS level. |
| CASSA | SSR. 0 | CAS MF Sync Active. Set while the synchronizer is searching <br> for the CAS MF alignment word. |
| CRC4SA | CRC4 MF Sync Active. Set while the synchronizer is searching <br> for the CRC4 MF alignment word. |  |

### 5.1 CRC4 Sync Counter

The CRC4 sync counter increments each time the 8 ms CRC4 multiframe search times out. The counter is cleared when the DS2153Q has successfully obtained synchronization at the CRC4 level. The counter can also be cleared by disabling the CRC4 mode (CCR1.0 = 0). This counter is useful for determining the amount of time the DS2153Q has been searching for synchronization at the CRC4 level. Annex B of CCITT G. 706 suggests that if synchronization at the CRC4 level cannot be obtained within 400 ms , then the search should be abandoned and proper action taken. The CRC4 sync counter will rollover.

## SR1: STATUS REGISTER 1 (Address = 06 Hex)

| RCL <br> (receive carrier loss) | 255 consecutive 0s received | In 255-bit times, at least 321 s are received | G. 775 |

SR2: STATUS REGISTER 2 (Address = 07 Hex)
(MSB)
(LSB)

| RMF | RAF | TMF | SEC | TAF | LOTC | RCMF | TSLIP |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |

## SYMBOL POSITION NAME AND DESCRIPTION

RMF SR2.7 Receive CAS Multiframe. Set every 2 ms (regardless if CAS signaling is enabled or not) on receive multiframe boundaries. Used to alert the host that signaling data is available.

RAF SR2.6 Receive Align Frame. Set every 250 ms at the beginning of align frames. Used to alert the host that Si and Sa bits are available in the RAF and RNAF registers.

TMF SR2.5 Transmit Multiframe. Set every $2 \mu$ s (regardless if CRC4 is enabled) on transmit multiframe boundaries. Used to alert the host that signaling data needs to be updated.

SEC
SR2.4 1-Second Timer. Set on increments of 1 second based on RCLK. If CCR2.7 $=1$, then this bit will be set every 62.5 ms instead of once a second.

TAF SR2.3 Transmit Align Frame. Set every $250 \mu$ s at the beginning of align frames. Used to alert the host that the TAF and TNAF registers need to be updated.

LOTC SR2.2 Loss of Transmit Clock. Set when the TCLK pin has not transitioned for one channel time (or $3.9 \mu \mathrm{~s}$ ). Will force pin 16 high if enabled via TCR2.0. Based on RCLK.

RCMF SR2.1 Receive CRC4 Multiframe. Set on CRC4 multiframe boundaries; will continue to be set every 2 ms on an arbitrary boundary if CRC4 is disabled.

TSLIP
SR2.0 Transmit Elastic Store Slip. Set when the elastic store has either repeated or deleted a frame of data.

$1=$ interrupt enabled

## 6 ERROR COUNT REGISTERS

There are a set of four counters in the DS2153Q that record bipolar or code violations, errors in the CRC4 SMF codewords, E bits as reported by the far end, and word errors in the FAS. Each of these four counters are automatically updated on either 1 -second boundaries $(C C R 2.7=0)$ or every 62.5 ms (CCR2.7 $=1$ ) as determined by the timer in Status Register 2 (SR2.4). Hence, these registers contain performance data from either the previous second or the previous 62.5 ms . The user can use the interrupt from the timer to determine when to read these registers. The user has a full second (or 62.5 ms ) to read the counters before the data is lost.

### 6.1 BPV or Code Violation Counter

Violation Count Register 1 (VCR1) is the most significant word and VCR2 is the least significant word of a 16-bit counter that records either Bipolar Violations (BPVs) or Code Violations (CVs). If CCR2.6 = 0, then the VCR counts bipolar violations. Bipolar violations are defined as consecutive marks of the same polarity. In this mode, if the HDB3 mode is set for the receive side via CCR1.2, then HDB3 codewords are not counted as BPVs. If CCR2.6 $=1$, then the VCR counts code violations as defined in CCITT O.161. Code violations are defined as consecutive bipolar violations of the same polarity. In most applications, the DS2153Q should be programmed to count BPVs when receiving AMI code and to count CVs when receiving HDB3 code. This counter increments at all times and is not disabled by loss of sync conditions. The counter saturates at 65,535 and will not rollover. The bit error rate on an E1 line would have to be greater than $10^{* *}-2$ before the VCR would saturate.

VCR1: UPPER BIPOLAR VIOLATION COUNT REGISTER 1 (Address = 00 Hex)
VCR2: LOWER BIPOLAR VIOLATION COUNT REGISTER 2 (Address = 01 Hex)
(MSB)

| V15 | V14 | V13 | V12 | V11 | V10 | V9 | V8 | VCR1 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | V7 | V6 | V5 | V4 | V3 | V2 | V1 | V0 |
| VCR2 |  |  |  |  |  |  |  |  |

## SYMBOL POSITION NAME AND DESCRIPTION

V15 VCR1.7 MSB of the 16-bit bipolar or code violation count.
V0 $\quad$ VCR2.0 $\quad$ LSB of the 16-bit bipolar or code violation count.

### 6.2 CRC4 Error Counter

CRC4 Count Register 1 (CRCCR1) is the most significant word and CRCCR2 is the least significant word of a 10-bit counter that records word errors in the Cyclic Redundancy Check 4 (CRC4). Since the maximum CRC4 count in a 1 -second period is 1000 , this counter cannot saturate. The counter is disabled during loss of sync at either the FAS or CRC4 level; it will continue to count if loss of multiframe sync occurs at the CAS level.
CRCCR1: CRC4 COUNT REGISTER $\mathbf{1}$ (Address = 02 Hex)
CRCCR2: CRC4 COUNT REGISTER 2 (Address = 03 Hex)
((MSB)

| (See note) | (See note) | (See note) | (See note) | (See note) | (See note) | CRC9 | CRC8 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

| CRCCR2 |  |  |  |  |  |  |  |

SYMBOL POSITION NAME AND DESCRIPTION
CRC9 CRCCR1.1 MSB of the 10 -bit CRC4 error count.
CRC0 CRCCR2.0 LSB of the 10 -bit CRC4 error count.

Note: The upper 6 bits of CRCCR1 at address 02 are the most significant bits of the 12-bit FAS error counter.

### 6.3 E-Bit Counter

E-bit Count Register 1 (EBCR1) is the most significant word and EBCR2 is the least significant word of a 10-bit counter that records Far End Block Errors (FEBE) as reported in the first bit of frames 13 and 15 on E1 lines running with CRC4 multiframe. These count registers will increment once each time the received E-bit is set to 0 . Since the maximum E-bit count in a 1 -second period is 1000 , this counter cannot saturate. The counter is disabled during loss of sync at either the FAS or CRC4 level; it will continue to count if loss of multiframe sync occurs at the CAS level.

| EB0 | EBCR2.0 | LSB of the 10-bit E-bit count. |

[^0]
### 6.4 FAS Bit Error Counter

FAS Count Register 1 (FASCR1) is the most significant word and FASCR2 is the least significant word of a 12 -bit counter that records word errors in the Frame Alignment Signal in time slot 0. This counter is disabled during loss of synchronization conditions, ( $\mathrm{RLOS}=1$ ). Since the maximum FAS word error count in a 1 -second period is 4000 , this counter cannot saturate.

FASCR1: FAS BIT COUNT REGISTER 1 (Address = 02 Hex)

FAS0 $\quad$ FASCR2.2 $\quad$ LSB of the 12-bit FAS error count.

[^1]
## 7 Sa DATA LINK CONTROL AND OPERATION

The DS2153Q provides for access to the proposed E1 performance monitor data link in the Sa bit positions. The device allows access to the Sa bits either via a set of two internal registers (RNAF and TNAF) or via two external pins (RLINK and TLINK).

On the receive side, the Sa bits are always reported in the internal RNAF register (see Section 12 for more details). All five Sa bits are always output at the RLINK pin. See Section 14 for detailed timing. Via RCR2, the user can control the RLCLK pin to pulse during any combination of Sa bits. This allows the user to create a clock that can be used to capture the needed Sa bits.

On the transmit side, the individual Sa bits can be either sourced from the internal TNAF register (TCR1.6 $=0$ ) or from the external TLINK pin. Via TCR2, the DS2153Q can be programmed to source any combination of the additional bits from the TLINK pin. If the user wishes to pass the Sa bits through the DS2153Q without them being altered, then the device should be set up to source all five Sa bits via the TLINK pin and the TLINK pin should be tied to the TSER pin. See the timing diagrams and the transmit data flow diagram in Section $\underline{14}$ for examples.

## 8 SIGNALING OPERATION

The Channel Associated Signaling (CAS) bits embedded in the E1 stream can be extracted from the receive stream and inserted into the transmit stream by the DS2153Q. Each of the 30 channels has four signaling bits ( $\mathrm{A} / \mathrm{B} / \mathrm{C} / \mathrm{D}$ ) associated with it. The numbers in parentheses are the channel associated with a particular signaling bit. The channel numbers have been assigned as described in the ITU documents. For example, channel 1 is associated with time slot 1 and channel 30 is associated with time slot 31 . There is a set of 16 registers for the receive side (RS1 to RS16) and 16 registers on the transmit side (TS1 to TS16). The signaling registers are detailed below.

## RS1 TO RS16: RECEIVE SIGNALING REGISTERS (Address = 30 to 3F Hex) <br> (MSB) (LSB)

## Spare Bits

Remote Alarm Bit (integrated and reported in SR1.6)
Signaling Bit A for Channel 1
Signaling Bit D for Channel 30
Each Receive Signaling Register (RS1 to RS16) reports the incoming signaling from two time slots. The bits in the Receive Signaling Registers are updated on multiframe boundaries so the user can utilize the Receive Multiframe Interrupt in the Receive Status Register 2 (SR2.7) to know when to retrieve the signaling bits. The user has a full 2 ms to retrieve the signaling bits before the data is lost. The RS registers are updated under all conditions. Their validity should be qualified by checking for synchronization at the CAS level. In CCS signaling mode, RS1 to RS16 can also be used to extract signaling information. Via the SR2.7 bit, the user will be informed when the signaling registers have been loaded with data. The user has 2 ms to retrieve the data before it is lost.

TS1 TO TS16: TRANSMIT SIGNALING REGISTERS (Address = 40 to 4F Hex)
(MSB) (LSB)

SYMBOL POSITION NAME AND DESCRIPTION

| X | TS1.0/1/3 | Spare Bits |
| :---: | :---: | :--- |
| Y | TS1.2 | Remote Alarm Bit |
| A(1) | TS2.7 | Signaling Bit A for Channel 1 |
| D(30) | TS16.0 | Signaling Bit D for Channel 30 |

Each Transmit Signaling Register (TS1 to TS16) contains the CAS bits for two time slots that will be inserted into the outgoing stream if enabled to do so via TCR1.5. On multiframe boundaries, the DS2153Q will load the values present in the Transmit Signaling Register into an outgoing signaling shift register that is internal to the device. The user can utilize the Transmit Multiframe bit in Status Register 2 (SR2.5) to know when to update the signaling bits. The bit will be set every 2 ms and the user has 2 ms to update the TSRs before the old data will be retransmitted.

The TS1 register is special because it contains the CAS multiframe alignment word in its upper nibble. The upper nibble must always be set to 0000 , or else the terminal at the far end will lose multiframe synchronization. If the user wishes to transmit a multiframe alarm to the far end, then the TS1.2 bit should be set to a 1. If no alarm is to be transmitted, then the TS1.2 bit should be cleared. The three remaining bits in TS1 are the spare bits. If they are not used, they should be set to 1 . In CCS signaling mode, TS1 to TS16 can also be used to insert signaling information. Via the SR2.5 bit, the user will be informed when the signaling registers need to be loaded with data. The user has 2 ms to load the data before the old data will be retransmitted. Via the CCR3.6 bit, the user has the option to use the Transmit Channel Blocking Registers (TCBRs) to determine on a channel by channel basis which signaling bits are to be inserted via the TSRs (the corresponding bit in the TCBRs $=1$ ) and which are to be sourced from the TSER pin (the corresponding bit in the TCBRs $=0$ ). See the Transmit Data Flow diagram in Section 14 for more details.

## 9 TRANSMIT IDLE REGISTERS

There is a set of five registers in the DS2153Q that can be used to custom tailor the data that is to be transmitted onto the E1 line, on a channel-by-channel basis. Each of the 32 E1 channels can be forced to have a user-defined idle code inserted into them.

TIR1/TIR2/TIR3/TIR4: TRANSMIT IDLE REGISTERS (Address = 26 to 29 Hex)
(MSB)

| CH8 | CH7 | CH6 | CH5 | CH4 | CH3 | CH2 | CH1 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| CH16 | CH15 | CH14 | CH13 | CH12 | CH11 | CH10 | CH9 |
| CH24 | CH23 | CH22 | CH21 | CH20 | CH19 | CH18 | CH17 |
| CH32 | CH31 | CH30 | CH29 | CH28 | CH27 | CH26 | CH25 |

SYMBOL POSITION NAME AND DESCRIPTION
CH32 TIR4.7 Transmit Idle Registers.
$0=$ do not insert the Idle Code into this channel
CH1 TIR1.0 $1=$ insert the Idle Code into this channel
Note: If CCR3.5 = 1, then a 0 in the TIRs implies that channel data is to be sourced from TSER and a 1 implies that channel data is to be sourced from the RSER pin.

TIDR: TRANSMIT IDLE DEFINITION REGISTER (Address = 2A Hex) (MSB)

| TIDR7 | TIDR6 | TIDR5 | TIDR4 | TIDR3 | TIDR2 | TIDR1 | TIDR0 |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |

| SYMBOL | POSITION | NAME AND DESCRIPTION |
| :---: | :---: | :--- |
| TIDR7 | TIDR. 7 | MSB of the Idle Code |
| TIDR0 | TIDR. 0 | LSB of the Idle Code |

Each of the bit positions in the Transmit Idle Registers (TIR1/TIR2/TIR3/TIR4) represents a time slot in the outgoing frame. When these bits are set to a 1 , the corresponding channel will transmit the Idle Code contained in the Transmit Idle Definition Register (TIDR). In the TIDR, the MSB is transmitted first. Via the CCR3.5 bit, the user has the option to use the TIRs to determine on a channel-by-channel basis, if data from the RSER pin should be substituted for data from the TSER pin. In this mode, if the corresponding bit in the TIRs is set to 1 , then data will be sourced from the RSER pin. If the corresponding bit in the TIRs is set to 0 , then data for that channel will sourced from the TSER pin. See the Transmit Data Flow diagram in Section 14 for more details.

## 10 CLOCK BLOCKING REGISTERS

The Receive Channel Blocking Registers (RCBR1/RCBR2/RCBR3/RCBR4) and the Transmit Channel Blocking Registers (TCBR1/TCBR2/TCBR3/TCBR4) control the RCHBLK and TCHBLK pins, respectively. The RCHBLK and TCHCLK pins are user-programmable outputs that can be forced either high or low during individual channels. These outputs can be used to block clocks to a USART or LAPD controller in ISDN-PRI applications. When the appropriate bits are set to a 1 , the RCHBLK and TCHCLK pins will be held high during the entire corresponding channel time. See the timing diagrams in Section $\underline{14}$ for an example. The TCBRs have an alternate mode of use. Via the CCR3.6 bit, the user has the option to use the TCBRs to determine on a channel by channel basis, which signaling bits are to be inserted via the TSRs (the corresponding bit in the TCBRs $=1$ ) and which are to be sourced from the TSER pin (the corresponding bit in the TCBR = 0). See the Transmit Data Flow diagram in Section 14 for more details.

## RCBR1/RCBR2/RCBR3/RCBR4: RECEIVE CHANNEL BLOCKING REGISTERS (Address = 2B to 2E Hex)

(MSB)

| CH8 | CH7 | CH6 | CH5 | CH4 | CH3 | CH2 | CH1 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

[^2]
## 11 ELASTIC STORES OPERATION

The DS2153Q has an on-board two-frame ( 512 bits) elastic store. This elastic store can be enabled via RCR2.1. If the elastic store is enabled (RCR2.1=1), then the user must provide either a 1.544 MHz $(\operatorname{RCR} 2.2=0)$ or $2.048 \mathrm{MHz}(\operatorname{RCR} 2.2=1)$ clock at the SYSCLK pin. If the elastic store is enabled, then the user has the option of either providing a frame sync at the RSYNC pin (RCR1.5 =1) or having the RSYNC pin provide a pulse on frame or multiframe boundaries (RCR1.5 = 0). If the user wishes to obtain pulses at the frame boundary, then RCR1.6 must be set to 0 , and if the user wishes to have pulses occur at the multiframe boundary, then RCR1.6 must be set to 1 . If the user selects to apply a 1.544 MHz clock to the SYSCLK pin, then every fourth channel will be deleted and the F-bit position inserted (forced to 1 ). Hence channels $1,5,9,13,17,21,25$, and 29 (time slots $0,4,8,12,16,20,24$, and 28 ) will be deleted. Also, in 1.544 MHz applications, the RCHBLK output will not be active in channels 25 through 32 (or in other words, RCBR4 is not active). See Section 14 for more details. If the 512-bit elastic buffer either fills or empties, a controlled slip will occur. If the buffer empties, then a full frame of data ( 256 bits) will be repeated at RSER and the SR1. 4 and RIR. 3 bits will be set to 1 . If the buffer fills, then a full frame of data will be deleted and the SR1.4 and RIR. 4 bits will be set to 1 .

## 12 ADDITIONAL (Sa) AND INTERNATIONAL (Si) BIT OPERATION

The DS2153Q provides for access to both the Additional ( $\mathrm{Sa} \mathrm{)} \mathrm{and} \mathrm{International} \mathrm{(Si)} \mathrm{bits}$. side, the RAF and RNAF registers will always report the data as it received in the Additional and International bit locations. The RAF and RNAF registers are updated with the setting of the Receive Align Frame bit in Status Register 2 (SR2.6). The host can use the SR2.6 bit to know when to read the RAF and RNAF registers. It has $250 \mu$ s to retrieve the data before it is lost.

On the transmit side, data is sampled from the TAF and TNAF registers with the setting of the Transmit Align Frame bit in Status Register 2 (SR2.3). The host can use the SR2.3 bit to know when to update the TAF and TNAF registers. It has $250 \mu$ s to update the data or else the old data will be retransmitted. Data in the Si bit position will be overwritten if either the DS2153Q is programmed: (1) to source the Si bits from the TSER pin, (2) in the CRC4 mode, or (3) have automatic E-bit insertion enabled. Data in the Sa bit position will be overwritten if any of the TCR2.3 to TCR2.7 bits are set to 1 . See the register descriptions for TCR1 and TCR2 and the Transmit Data Flow diagram in Section $\underline{14}$ for more details.

## 13 LINE INTERFACE FUNCTIONS

The line interface function in the DS2153Q contains three sections: the receiver, which handles clock and data recovery; the transmitter, which waveshapes and drives the T1 line; and the jitter attenuator. Each of these three sections is controlled by the Line Interface Control Register (LICR), which is described below.
LICR: LINE INTERFACE CONTROL REGISTER (Address $=\mathbf{1 8} \mathbf{~ H e x )}$
(MSB)

| (LSB) |

$1=32$ bits (use for delay sensitive applications)
DJA LICR. 1 Disable Jitter Attenuator.
$0=$ jitter attenuator enabled
$1=$ jitter attenuator disabled
TPD LICR. 0 Transmit Power Down.
$0=$ normal transmitter operation
1 = powers down the transmitter and tri-states the TTIP and TRING pins

### 13.1 Receive Clock and Data Recovery

The DS2153Q contains a digital clock recovery system. See Figure 1-1 and Figure 13-1 for more details. The DS2153Q couples to the receive E1 twisted pair or coax via a $1: 1$ transformer. See Table 13-3 for transformer details. The DS2153Q automatically adjusts to the E1 signal being received at the RTIP and RRING pins and can handle E1 twisted pair cables of 0.6 mm (22AWG) from 0 to 1.5 km in length. The crystal attached at the XTAL1 and XTAL2 pins is multiplied by 4 via an internal PLL and fed to the clock recovery system. The clock recovery system uses both edges of the clock from the PLL circuit to form a 32 times oversampler that is used to recover the clock and data. This oversampling technique offers outstanding jitter tolerance (see Figure 13-2).

Normally, the clock that is output at the RCLK pin is the recovered clock from the E1 AMI waveform presented at the RTIP and RRING inputs. When no AMI signal is present at RTIP and RRING, a Receive Carrier Loss (RCL) condition will occur and the RCLK can be sourced from either the ACLKI pin or from the crystal attached to the XTAL1 and XTAL2 pins. The DS2153Q will sense the ACLKI pin to determine if a clock is present. If no clock is applied to the ACLKI pin, then it should be tied to RVSS to prevent the device from falsely sensing a clock. See Table 13-1. If the jitter attenuator is either placed in the transmit path or is disabled, the RCLK output can exhibit short high cycles of the clock. This is due to the highly oversampled digital clock recovery circuitry. If the jitter attenuator is placed in the receive path (as is the case in most applications), the jitter attenuator restores the RCLK to being close to $50 \%$ duty cycle. See the receive AC timing characteristics in Section $\underline{16}$ for more details.

Table 13-1. Source of RCLK Upon RCL

| ACLKI PRESENT? | RECEIVE SIDE JITTER <br> ATTENUATOR | TRANSMIT SIDE JITTER |
| :---: | :---: | :---: |
| ATTENUATOR |  |  |$|$| Yes | ACLKI via the jitter attenuator | ACLKI |
| :---: | :---: | :---: |
| No | Centered crystal | TCLK via the jitter attenuator |

### 13.2 Transmit Waveshaping and Line Driving

The DS2153Q uses a set of laser-trimmed delay lines along with a precision digital-to-analog converter (DAC) to create the waveforms that are transmitted onto the E1 line. The waveforms created by the DS2153Q meet the ITU specifications. See Figure 13-3. The user will select which waveform is to be generated by properly programming the L0 to L2 bits in the Line Interface Control Register (LICR). The DS2153Q can set up in a number of various configurations depending on the application. See Table 13-2 and Figure 1-1.
Table 13-2. LBO Select in LICR

| L2 | L1 | L0 | APPLICATION | TRANSFORMER | RETURN LOSS <br> $(\mathbf{d B})$ | Rt ( $\Omega \mathbf{)}$ |
| :---: | :---: | :---: | :--- | :---: | :---: | :---: |
| 0 | 0 | 0 | $75 \Omega$ normal | $1: 1.15$ step-up | N.M. | 0 |
| 0 | 0 | 1 | $120 \Omega$ normal | $1: 1.15$ step-up | N.M. | 0 |
| 0 | 1 | 0 | $75 \Omega$ normal with protection <br> resistors | $1: 1.15$ step-up | N.M. | 8.2 |
| 0 | 1 | 1 | $120 \Omega$ normal with protection <br> resistors | $1: 1.15$ step-up | N.M. | 8.2 |
| 1 | 0 | 0 | $75 \Omega$ with high return loss | $1: 1.15$ step-up | 21 | 27 |
| 1 | 1 | 0 | $75 \Omega$ with high return loss | $1: 1.36$ step-up | 21 | 18 |
| 1 | 0 | 0 | $120 \Omega$ with high return loss | $1: 1.36$ step-up | 21 | 27 |

N.M. $=$ not meaningful

Due to the nature of the design of the transmitter in the DS 2153 Q , very little jitter (less than $0.005 \mathrm{UI}_{\mathrm{P}-\mathrm{P}}$ broadband from 10 Hz to 100 kHz ) is added to the jitter present on TCLK. Also, the waveforms that they create are independent of the duty cycle of TCLK. The transmitter in the DS2153Q couples to the E1 transmit shielded twisted pair or coax via a 1:1.15 or 1:1.36 step-up transformer as shown in Figure 13-1. For the devices to create the proper waveforms, the transformer used must meet the specifications listed in Table 13-3.

Table 13-3. Transformer Specifications

| SPECIFICATION | RECOMMENDED VALUE |
| :--- | :--- |
| Turns Ratio | $1: 1$ (receive) and $1: 1.15$ or $1: 1.36$ (transmit) $\pm 5 \%$ |
| Primary Inductance | $600 \mu \mathrm{H}$ minimum |
| Leakage Inductance | $1.0 \mu \mathrm{H}$ maximum |
| Intertwining Capacitance | 60 pF maximum |
| DC Resistance | $1.2 \Omega$ maximum |

### 13.3 Jitter Attenuator

The DS2153Q contains an on-board jitter attenuator that can be set to a depth of either 32 or 128 bits via the JABDS bit in the Line Interface Control Register (LICR). The 128-bit mode is used in applications where large excursions of wander are expected. The 32-bit mode is used in delay sensitive applications. The characteristics of the attenuation are shown in Figure 13-4. The jitter attenuator can be placed in either the receive path or the transmit path by appropriately setting or clearing the JAS bit in the LICR. Also, the jitter attenuator can be disabled (in effect, removed) by setting the DJA bit in the LICR. In order for the jitter attenuator to operate properly, a crystal with the specifications listed in Table 13-4 must be connected to the XTAL1 and XTAL2 pins.

The jitter attenuator divides the clock provided by the 8.192 MHz crystal at the XTAL1 and XTAL2 pins to create an output clock that contains very little jitter. On-board circuitry will pull the crystal (by switching in or out load capacitance) to keep it long-term averaged to the same frequency as the incoming E1 signal. If the incoming jitter exceeds either 120UI ${ }_{p-P}$ (buffer depth is 128 bits) or $28 \mathrm{UI}_{p-\mathrm{P}}$ (buffer depth is 32 bits), then the DS2153Q will divide the attached crystal by either 3.5 or 4.5 instead of the normal 4 to keep the buffer from overflowing. When the device divides by either 3.5 or 4.5 , it also sets the Jitter Attenuator Limit Trip (JALT) bit in the Receive Information Register (RIR.5).
Table 13-4. Crystal Selection Guidelines

| PARAMETER | SPECIFICATION |
| :--- | :--- |
| Parallel Resonant Frequency | 8.192 MHz |
| Mode | Fundamental |
| Load Capacitance | 18 pF to $20 \mathrm{pF}(18.5 \mathrm{pF}$ nominal $)$ |
| Tolerance | $\pm 50 \mathrm{ppm}$ |
| Pullability | $\mathrm{C}_{\mathrm{L}}=10 \mathrm{pF}$, delta frequency $=+175 \mathrm{ppm}$ to |
|  | +250 pmm |
|  | $\mathrm{C}_{\mathrm{L}}=45 \mathrm{pF}$, delta frequency $=-175 \mathrm{ppm}$ to -250 ppm |
| Effective Series Resistance | $30 \Omega$ maximum |
| Crystal Cut | AT |

Figure 13-1. External Analog Connections

NOTE 1: ALL RESISTOR VALUES ARE $\pm 1 \%$.
NOTE 2: THE RT RESISTORS ARE USED TO INCREASE THE TRANSMITTER RETURN LOSS OR TO PROTECT THE DEVICE FROM OVERVOLTAGE.
NOTE 3: THE RR RESISTORS ARE USED TO TERMINATE THE RECEIVE E1 LINE.
NOTE 4: FOR $75 \Omega$ TERMINATION, $R_{R}=37.5 \Omega / F O R 12 \Omega$ TERMINATION $R_{R}=60 \Omega$.
NOTE 5: SEE THE SEPARATE APPLICATION NOTE FOR DETAILS ON HOW TO CONSTRUCT A PROTECTED INTERFACE.

[^0]:    Note: The upper 6 bits of EBCR1 at address 04 are the least significant bits of the 12-bit FAS error counter.

[^1]:    Note 1: The lower 2 bits of FASCR1 at address 02 are the most significant bits of the 10-bit CRC4 error counter. Note 2: The lower 2 bits of FASCR2 at address 04 are the most significant bits of the 10-bit E-bit counter.

[^2]:    ${ }^{*}$ CH1 and CH17 should be set to 1 to allow the internal TS1 register to create the CAS Multiframe Alignment Word and Spare/Remote Alarm bits.

[^3]:    Maxim/Dallas Semiconductor cannot assume responsibility for use of any circuitry other than circuitry entirely embodied in a Maxim/Dallas Semiconductor product. No circuit patent licenses are implied. Maxim/Dallas Semiconductor reserves the right to change the circuitry and specifications without notice at any time.
