

## Dual-Channel, 2.3 GHz to 2.8 GHz, 20 W Receiver Front End

### FEATURES

- ▶ Integrated dual-channel RF front end
  - ▶ 2-stage LNA and high power silicon SPDT switch
  - ▶ On-chip bias and matching
  - ▶ Single-supply operation
- ▶ High power handling at  $T_{CASE} = 105^{\circ}C$ 
  - ▶ LTE average power (9 dB PAR) full lifetime: 43 dBm
- ▶ Gain
  - ▶ High gain mode: 35 dB typical at 2.6 GHz
  - ▶ Low gain mode: 14 dB typical at 2.6 GHz
- ▶ Low noise figure
  - ▶ High gain mode: 1.0 dB typical at 2.6 GHz
  - ▶ Low gain mode: 1.0 dB typical at 2.6 GHz
- ▶ High isolation
  - ▶ RXOUT-CHA and RXOUT-CHB: 45 dB typical
  - ▶ TERM-CHA and TERM-CHB: 60 dB typical
- ▶ Low insertion loss: 0.5 dB typical at 2.6 GHz
- ▶ High OIP3: 32 dBm typical
- ▶ Power-down mode and low gain mode
- ▶ Low supply current
  - ▶ High gain mode: 110 mA typical at 5 V
  - ▶ Low gain mode: 36 mA typical at 5 V
  - ▶ Power-down mode: 12 mA typical at 5 V
- ▶ Positive logic control
- ▶ 6 mm × 6 mm, 40-lead LFCSP package
- ▶ Pin compatible with the [ADRF5545A](#) and [ADRF5549](#) 10 W versions

### APPLICATIONS

- ▶ Wireless infrastructure
- ▶ TDD massive multiple input and multiple output and active antenna systems
- ▶ TDD-based communication systems

### GENERAL DESCRIPTION

The ADRF5519 is a dual-channel, integrated RF, front-end multichip module designed for time division duplexing (TDD) applications that operates from 2.3 GHz to 2.8 GHz. The ADRF5519 is configured in dual channels with a cascading two-stage low noise amplifier (LNA) and a high power silicon single-pole, double-throw (SPDT) switch.

In high gain mode, the cascaded two-stage LNA and switch offer a low noise figure (NF) of 1.0 dB and a high gain of 35 dB at 2.6 GHz with an output third-order intercept point (OIP3) of 32 dBm (typical). In low gain mode, one stage of the two-stage LNA is in bypass, providing 14 dB of gain at a lower current of 36 mA. In power-down mode, the LNAs are turned off and the device draws 12 mA.

In transmit operation, RF inputs are connected to a termination pin (ANT-CHA or ANT-CHB connected to TERM-CHA or TERM-CHB, respectively). The switch provides a low insertion loss of 0.5 dB and handles a long-term evolution (LTE) average power (9 dB peak to average ratio (PAR)) of 43 dBm for full lifetime operation.

The device comes in a RoHS-compliant, compact, 6 mm × 6 mm, 40-lead LFCSP package.

<sup>1</sup>  $V_{DD}$  is the voltage of the SWVDD-CHAB pin.

<sup>2</sup>  $V_{DD}$  is the voltage of the VDD1-CHA, VDD1-CHB, VDD2-CHA, and VDD2-CHB pins.

Stresses at or above those listed under Absolute Maximum Ratings may cause permanent damage to the product. This is a stress rating only; functional operation of the product at these or any other conditions above those indicated in the operational section of this specification is not implied. Operation beyond the maximum operating conditions for extended periods may affect product reliability.

## THERMAL RESISTANCE

Thermal performance is directly linked to printed circuit board (PCB) design and operation environment. Careful attention to PCB thermal design is required.

$\theta_{JC}$  is the junction to case bottom (channel to package bottom) thermal resistance.

Table 3. Thermal Resistance

## ELECTROSTATIC DISCHARGE (ESD) RATINGS

The following ESD information is provided for handling of ESD-sensitive devices in an ESD protected area only.

Human body model (HBM) per ANSI/ESDA/JEDEC JS-001.

Charged device model (CDM) per ANSI/ESDA/JEDEC JS-002.

HBM	1000	1C
CDM	750	C2

## ESD CAUTION

**ESD (electrostatic discharge) sensitive device.** Charged devices and circuit boards can discharge without detection. Although this product features patented or proprietary protection circuitry, damage may occur on devices subjected to high energy ESD. Therefore, proper ESD precautions should be taken to avoid performance degradation or loss of functionality.

## THEORY OF OPERATION

The ADRF5519 requires a positive supply voltage applied to the VDD1-CHA pin, VDD2-CHA pin, VDD1-CHB pin, VDD2-CHB pin, and SWVDD-CHAB pin. Use bypassing capacitors on the supply lines to filter noise.

### SIGNAL PATH SELECT

The ADRF5519 supports transmit operations when 5 V is applied to SWCTRL-CHAB. In transmit operation, when an RF input is applied to ANT-CHA and ANT-CHB, the signal paths are connected from ANT-CHA to TERM-CHA and from ANT-CHB to TERM-CHB.

The ADRF5519 supports receive operations when 0 V is applied to SWCTRL-CHAB. In receive operation, an RF input applied at ANT-CHA and ANT-CHB connects ANT-CHA to RXOUT-CHA and ANT-CHB to RXOUT-CHB.

### Receive Operation

The ADRF5519 supports high gain mode, low gain mode, power-down high isolation mode, and power-down low isolation mode in receive operation, as detailed in [Table 7](#).

When 0 V is applied to PD-CHAB, the LNA is powered up and the user can select high gain mode or low gain mode. To select high gain mode, apply 0 V to BP-CHA or BP-CHB. To select low gain mode, apply 5 V to BP-CHA or BP-CHB.

When 5 V is applied to PD-CHAB, the ADRF5519 enters power-down mode. To select power-down high isolation mode, apply 0 V to BP-CHA or BP-CHB. To select power-down low isolation mode, apply 5 V to BP-CHA or BP-CHB.

### BIASING SEQUENCE

To bias up the ADRF5519, perform the following steps:

1. Connect any GND pin to ground.
2. Bias up VDD1-CHA, VDD2-CHA, VDD1-CHB, VDD2-CHB, and SWVDD-CHAB.
3. Bias up SWCTRL-CHAB.
4. Bias up PD-CHAB.
5. Bias up BP-CHA and BP-CHB.
6. Apply an RF input signal.

To bias down, perform these steps in the reverse order.

## APPLICATIONS INFORMATION

To generate the evaluation PCB used in a typical application circuit, use proper RF circuit design techniques. Signal lines at the RF port must have a 50  $\Omega$  impedance, and the package ground leads and the backside ground slug must connect directly to the ground plane. Use 300  $\Omega$  series resistors on the BP-CHx and PD-CHAB digital control pins for glitch and overcurrent protection. The ADRF5519-EVALZ is available from Analog Devices, Inc., upon request.

### 1.9 GHZ OPERATION

The ADRF5519 can be used for applications at 1.9 GHz, tuned from 1.7 GHz to 2.1 GHz, and 3 dB derated from [Table 1](#) power rating. [Table 9](#) shows the typical specifications of the [ADRF5519-EVALZ](#) tuned at 1.9 GHz.

[Table 8](#) lists the required matching components. The ADRF5519-EVALZ is assembled and shipped without any matching components by default. The ADRF5519-EVALZ can be tuned for a 1.9 GHz application with a series RF trace and a parallel capacitor, as shown in [Table 8](#).

**Table 8. Matching Components**
