To our customers,

## Old Company Name in Catalogs and Other Documents

On April $1^{\text {st }}$, 2010, NEC Electronics Corporation merged with Renesas Technology Corporation, and Renesas Electronics Corporation took over all the business of both companies. Therefore, although the old company name remains in this document, it is a valid Renesas Electronics document. We appreciate your understanding.

Renesas Electronics website: http://www.renesas.com

Issued by: Renesas Electronics Corporation (http://www.renesas.com)
Send any inquiries to http://www.renesas.com/inquiry.

## Notice

1. All information included in this document is current as of the date this document is issued. Such information, however, is subject to change without any prior notice. Before purchasing or using any Renesas Electronics products listed herein, please confirm the latest product information with a Renesas Electronics sales office. Also, please pay regular and careful attention to additional and different information to be disclosed by Renesas Electronics such as that disclosed through our website.
2. Renesas Electronics does not assume any liability for infringement of patents, copyrights, or other intellectual property rights of third parties by or arising from the use of Renesas Electronics products or technical information described in this document. No license, express, implied or otherwise, is granted hereby under any patents, copyrights or other intellectual property rights of Renesas Electronics or others.
3. You should not alter, modify, copy, or otherwise misappropriate any Renesas Electronics product, whether in whole or in part.
4. Descriptions of circuits, software and other related information in this document are provided only to illustrate the operation of semiconductor products and application examples. You are fully responsible for the incorporation of these circuits, software, and information in the design of your equipment. Renesas Electronics assumes no responsibility for any losses incurred by you or third parties arising from the use of these circuits, software, or information.
5. When exporting the products or technology described in this document, you should comply with the applicable export control laws and regulations and follow the procedures required by such laws and regulations. You should not use Renesas Electronics products or the technology described in this document for any purpose relating to military applications or use by the military, including but not limited to the development of weapons of mass destruction. Renesas Electronics products and technology may not be used for or incorporated into any products or systems whose manufacture, use, or sale is prohibited under any applicable domestic or foreign laws or regulations.
6. Renesas Electronics has used reasonable care in preparing the information included in this document, but Renesas Electronics does not warrant that such information is error free. Renesas Electronics assumes no liability whatsoever for any damages incurred by you resulting from errors in or omissions from the information included herein.
7. Renesas Electronics products are classified according to the following three quality grades: "Standard", "High Quality", and "Specific". The recommended applications for each Renesas Electronics product depends on the product's quality grade, as indicated below. You must check the quality grade of each Renesas Electronics product before using it in a particular application. You may not use any Renesas Electronics product for any application categorized as "Specific" without the prior written consent of Renesas Electronics. Further, you may not use any Renesas Electronics product for any application for which it is not intended without the prior written consent of Renesas Electronics. Renesas Electronics shall not be in any way liable for any damages or losses incurred by you or third parties arising from the use of any Renesas Electronics product for an application categorized as "Specific" or for which the product is not intended where you have failed to obtain the prior written consent of Renesas Electronics. The quality grade of each Renesas Electronics product is "Standard" unless otherwise expressly specified in a Renesas Electronics data sheets or data books, etc.
"Standard": Computers; office equipment; communications equipment; test and measurement equipment; audio and visual equipment; home electronic appliances; machine tools; personal electronic equipment; and industrial robots.
"High Quality": Transportation equipment (automobiles, trains, ships, etc.); traffic control systems; anti-disaster systems; anticrime systems; safety equipment; and medical equipment not specifically designed for life support.
"Specific": Aircraft; aerospace equipment; submersible repeaters; nuclear reactor control systems; medical equipment or systems for life support (e.g. artificial life support devices or systems), surgical implantations, or healthcare intervention (e.g. excision, etc.), and any other applications or purposes that pose a direct threat to human life.
8. You should use the Renesas Electronics products described in this document within the range specified by Renesas Electronics, especially with respect to the maximum rating, operating supply voltage range, movement power voltage range, heat radiation characteristics, installation and other product characteristics. Renesas Electronics shall have no liability for malfunctions or damages arising out of the use of Renesas Electronics products beyond such specified ranges.
9. Although Renesas Electronics endeavors to improve the quality and reliability of its products, semiconductor products have specific characteristics such as the occurrence of failure at a certain rate and malfunctions under certain use conditions. Further, Renesas Electronics products are not subject to radiation resistance design. Please be sure to implement safety measures to guard them against the possibility of physical injury, and injury or damage caused by fire in the event of the failure of a Renesas Electronics product, such as safety design for hardware and software including but not limited to redundancy, fire control and malfunction prevention, appropriate treatment for aging degradation or any other appropriate measures. Because the evaluation of microcomputer software alone is very difficult, please evaluate the safety of the final products or system manufactured by you.
10. Please contact a Renesas Electronics sales office for details as to environmental matters such as the environmental compatibility of each Renesas Electronics product. Please use Renesas Electronics products in compliance with all applicable laws and regulations that regulate the inclusion or use of controlled substances, including without limitation, the EU RoHS Directive. Renesas Electronics assumes no liability for damages or losses occurring as a result of your noncompliance with applicable laws and regulations.
11. This document may not be reproduced or duplicated, in any form, in whole or in part, without prior written consent of Renesas Electronics.
12. Please contact a Renesas Electronics sales office if you have any questions regarding the information contained in this document or Renesas Electronics products, or if you have any other inquiries.
(Note 1) "Renesas Electronics" as used in this document means Renesas Electronics Corporation and also includes its majorityowned subsidiaries.
(Note 2) "Renesas Electronics product(s)" means any product developed or manufactured by or for Renesas Electronics.

1. This document is provided for reference purposes only so that Renesas customers may select the appropriate Renesas products for their use. Renesas neither makes warranties or representations with respect to the accuracy or completeness of the information contained in this document nor grants any license to any intellectual property rights or any other rights of Renesas or any third party with respect to the information in this document.
2. Renesas shall have no liability for damages or infringement of any intellectual property or other rights arising out of the use of any information in this document, including, but not limited to, product data, diagrams, charts, programs, algorithms, and application circuit examples.
3. You should not use the products or the technology described in this document for the purpose of military applications such as the development of weapons of mass destruction or for the purpose of any other military use. When exporting the products or technology described herein, you should follow the applicable export control laws and regulations, and procedures required by such laws and regulations.
4. All information included in this document such as product data, diagrams, charts, programs, algorithms, and application circuit examples, is current as of the date this document is issued. Such information, however, is subject to change without any prior notice. Before purchasing or using any Renesas products listed in this document, please confirm the latest product information with a Renesas sales office. Also, please pay regular and careful attention to additional and different information to be disclosed by Renesas such as that disclosed through our website. (http://www.renesas.com )
5. Renesas has used reasonable care in compiling the information included in this document, but Renesas assumes no liability whatsoever for any damages incurred as a result of errors or omissions in the information included in this document.
6. When using or otherwise relying on the information in this document, you should evaluate the information in light of the total system before deciding about the applicability of such information to the intended application. Renesas makes no representations, warranties or guaranties regarding the suitability of its products for any particular application and specifically disclaims any liability arising out of the application and use of the information in this document or Renesas products.
7. With the exception of products specified by Renesas as suitable for automobile applications, Renesas products are not designed, manufactured or tested for applications or otherwise in systems the failure or malfunction of which may cause a direct threat to human life or create a risk of human injury or which require especially high quality and reliability such as safety systems, or equipment or systems for transportation and traffic, healthcare, combustion control, aerospace and aeronautics, nuclear power, or undersea communication transmission. If you are considering the use of our products for such purposes, please contact a Renesas sales office beforehand. Renesas shall have no liability for damages arising out of the uses set forth above.
8. Notwithstanding the preceding paragraph, you should not use Renesas products for the purposes listed below:
(1) artificial life support devices or systems
(2) surgical implantations
(3) healthcare intervention (e.g., excision, administration of medication, etc.)
(4) any other purposes that pose a direct threat to human life

Renesas shall have no liability for damages arising out of the uses set forth in the above and purchasers who elect to use Renesas products in any of the foregoing applications shall indemnify and hold harmless Renesas Technology Corp., its affiliated companies and their officers, directors, and employees against any and all damages arising out of such applications.
9. You should use the products described herein within the range specified by Renesas, especially with respect to the maximum rating, operating supply voltage range, movement power voltage range, heat radiation characteristics, installation and other product characteristics. Renesas shall have no liability for malfunctions or damages arising out of the use of Renesas products beyond such specified ranges.
10. Although Renesas endeavors to improve the quality and reliability of its products, IC products have specific characteristics such as the occurrence of failure at a certain rate and malfunctions under certain use conditions. Please be sure to implement safety measures to guard against the possibility of physical injury, and injury or damage caused by fire in the event of the failure of a Renesas product, such as safety design for hardware and software including but not limited to redundancy, fire control and malfunction prevention, appropriate treatment for aging degradation or any other applicable measures. Among others, since the evaluation of microcomputer software alone is very difficult, please evaluate the safety of the final products or system manufactured by you.
11. In case Renesas products listed in this document are detached from the products to which the Renesas products are attached or affixed, the risk of accident such as swallowing by infants and small children is very high. You should implement safety measures so that Renesas products may not be easily detached from your products. Renesas shall have no liability for damages arising out of such detachment.
12. This document may not be reproduced or duplicated, in any form, in whole or in part, without prior written approval from Renesas.
13. Please contact a Renesas sales office if you have any questions regarding the information contained in this document, Renesas semiconductor products, or if you have any other inquiries.

## General Precautions in the Handling of MPU/MCU Products

The following usage notes are applicable to all MPU/MCU products from Renesas. For detailed usage notes on the products covered by this manual, refer to the relevant sections of the manual. If the descriptions under General Precautions in the Handling of MPU/MCU Products and in the body of the manual differ from each other, the description in the body of the manual takes precedence.

1. Handling of Unused Pins

Handle unused pins in accord with the directions given under Handling of Unused Pins in the manual.

- The input pins of CMOS products are generally in the high-impedance state. In operation with an unused pin in the open-circuit state, extra electromagnetic noise is induced in the vicinity of LSI, an associated shoot-through current flows internally, and malfunctions may occur due to the false recognition of the pin state as an input signal. Unused pins should be handled as described under Handling of Unused Pins in the manual.

2. Processing at Power-on

The state of the product is undefined at the moment when power is supplied.

- The states of internal circuits in the LSI are indeterminate and the states of register settings and pins are undefined at the moment when power is supplied.
In a finished product where the reset signal is applied to the external reset pin, the states of pins are not guaranteed from the moment when power is supplied until the reset process is completed.
In a similar way, the states of pins in a product that is reset by an on-chip power-on reset function are not guaranteed from the moment when power is supplied until the power reaches the level at which resetting has been specified.

3. Prohibition of Access to Reserved Addresses

Access to reserved addresses is prohibited.

- The reserved addresses are provided for the possible future expansion of functions. Do not access these addresses; the correct operation of LSI is not guaranteed if they are accessed.

4. Clock Signals

After applying a reset, only release the reset line after the operating clock signal has become stable. When switching the clock signal during program execution, wait until the target clock signal has stabilized.

- When the clock signal is generated with an external resonator (or from an external oscillator) during a reset, ensure that the reset line is only released after full stabilization of the clock signal. Moreover, when switching to a clock signal produced with an external resonator (or by an external oscillator) while program execution is in progress, wait until the target clock signal is stable.

5. Differences between Products

Before changing from one product to another, i.e. to one with a different type number, confirm that the change will not lead to problems.

- The characteristics of MPU/MCU in the same group but having different type numbers may differ because of the differences in internal memory capacity and layout pattern. When changing to products of different type numbers, implement a system-evaluation test for each of the products.

## Preface

The H8S/2245 Group is a series of high-performance microcontrollers with a 32 -bit H8S/2000 CPU core, and a set of on-chip peripheral functions required for system configuration.

The H8S/2000 CPU can execute basic instructions in one state, and is provided with sixteen 16-bit general registers with a 32 -bit internal configuration, and a concise and optimized instruction set. The CPU can handle a 16 Mbyte linear address space (architecturally 4 Gbytes). Programs based on the high-level language C can also be run efficiently.

The address space is divided into eight areas. The data bus width and access states can be selected for each of these areas, and various kinds of memory can be connected fast and easily.

On-chip memory consists of large-capacity ROM and RAM. PROM (ZTAT ${ }^{\oplus}$ ) and mask ROM versions are available, providing a quick and flexible response to conditions from ramp-up through full-scale volume production, even for applications with frequently changing specifications.

On-chip peripheral functions include a 16 -bit timer pulse unit (TPU), 8 -bit timers, watchdog timer (WDT), serial communication interface (SCI), A/D converter, and I/O ports.

In addition, an on-chip data transfer controller (DTC) is provided, enabling high-speed data transfer without CPU intervention.

Use of the H8S/2245 Group enables compact, high-performance systems to be implemented easily.

This manual describes the hardware of the H8S/2245 Group. Refer to the H8S/2600 Series and H8S/2000 Series Software Manual for a detailed description of the instruction set.

Note: ZTAT is a registered trademark of Renesas Technology Corp.

### 12.3.3 Multiprocessor

Communication Function
Figure 12.10 Sample Multiprocessor Serial Transmission Flowchart

447 Note * added to figure 12.10
[3] Serial transmission continuation procedure: ... Checking and clearing of the TDRE flag is automatic when the DTC* is activated by a transmit data empty interrupt (TXI) request, and ...
Note: * The case, in which the DTC automatically clears the TDRE flag, occurs only when DISEL in DTC is 0 with the transfer counter not being 0 . Therefore, the TDRE flag should be cleared by CPU when DISEL is 1 , or when DISEL is 0 with the transfer counter being 0 .

Clocked Synchronous Mode
Figure 12.16 Sample Serial Transmission Flowchart
$456 \quad$ Note * added to figure 12.16
[3] Serial transmission continuation procedure: ... Checking and clearing of the TDRE flag is automatic when the DTC* is activated by a transmit data empty interrupt (TXI) request, and ...

Note: * The case, in which the DTC automatically clears the TDRE flag, occurs only when DISEL in DTC is 0 with the transfer counter not being 0 . Therefore, the TDRE flag should be cleared by CPU when DISEL is 1 , or when DISEL is 0 with the transfer counter being 0 .
Note * added to figure 12.18
[5] Serial reception continuation procedure: ... RDRF flag is cleared automatically when the DTC* is activated by a receive data full interrupt (RXI) request, and ...
Note: * The case, in which the DTC automatically clears the RDRF flag, occurs only when DISEL in DTC is 0 with the transfer counter not being 0 . Therefore, the RDRF flag should be cleared by CPU when DISEL is 1 , or when DISEL is 0 with the transfer counter being 0 .

Figure 12.20 Sample Flowchart of Simultaneous Serial Transmit and Receive Operations

461 Note * added to figure 12.20
[5] Serial transmission/reception continuation procedure: ... Also the RDRF flag is cleared automatically when the DTC* is activated by a receive data full interrupt (RXI) request, and ...

Notes: When switching from transmit or receive operation to ...

* The case, in which the DTC automatically clears the TDRE flag or RDRF flag, occurs only when DISEL in the corresponding DTC transfer is 0 with the transfer counter not being 0 . Therefore, the corresponding flag should be cleared by CPU when DISEL in the corresponding DTC transfer is 1 , or when DISEL is 0 with the transfer counter being 0 .

| Item | Page | Revision (See Manual for Details) |
| :---: | :---: | :---: |
| 12.4 SCI Interrupt | 462 | Note * added |
|  |  | When TDRE flag in ... The TDRE flag is cleared to 0 automatically when data transfer is performed by the DTC*. The DTC cannot be activated by ... <br> When RDRF flag in ... The RDRF flag is cleared to 0 automatically when data transfer is performed by the DTC雾. The DTC cannot be activated by an ERI interrupt request. |
|  |  | Note: * The flag is not cleared when DISEL is 0 and the transfer counter value is not 0 . |
| 12.5 Usage Notes | 464 | Description added |
|  |  | The following points should be noted when using the SCI. |
|  |  | Module Stop Mode Setting |
|  |  | SCI operation can be disabled or enabled using the module stop control register. The initial setting is for SCI operation to be halted. Register access is enabled by clearing module stop mode. For details, see section 18, Power-Down Modes. |
|  |  | Relation between Writes to TDR and TDRE Flag |
|  | 467 | Restrictions Concerning DTC Updating <br> ... - When RDR is read by the DTC, be sure to set the activation source to the relevant SCI reception data full interrupt (RXI). |
|  |  | - The flag is cleared only when DISEL in DTC is 0 with the transfer counter not being 0 . When DISEL is 1 ,or DISEL is 0 with the transfer counter being 0 , the flag should be cleared by CPU. |
|  |  | Note that transmitting, in particular, may not successfully be executed unless the TDRE flag is cleared by CPU. |
|  | 467 <br> to 472 | Description of "Operation in Case of Mode Transition" and "Switching from SCK Pin Function to Port Pin Function" added |
| 13.2.2 Serial Status Register (SSR) | 479 | Bit 2 TEND description amended |
|  |  | [Clearing conditions] |
|  |  | - When 0 is written to ... <br> - When the DTC* is activated by a TXI interrupt and write data to TDR |
|  |  | [Setting conditions] ... |
|  |  | - When TDRE $=1$ and ERS = 0 (normal transmission) 12.5 etu after transmission of 1-byte serial character when $\mathrm{GM}=0$ <br> - When TDRE $=1$ and ERS $=0$ (normal transmission) 11.0 etu after transmission of 1-byte serial character when $\mathrm{GM}=1$ |

A. 1 Instruction List

(1) Data Transfer Instructions

Table A. 1 Instruction
Set
Note * added
LDM* STM*
Note: * Only register ER0 to ER6 should be used when using the STM/LDM instruction.

607 (2) Arithmetic Instructions
Note * added
TAS*
Note: * Only register ERO, ER1, ER4, or ER5 should be used when using the TAS instruction.

Table A. 4 Number of
Cycles in Instruction Execution

633 Notes *3 and *4 added
LDM* ${ }^{3}$
637 STM $^{* 3}$ TAS*
Notes: 3. Only register ER0 to ER6 should be used when using the STM/LDM instruction.
4. Only register ER0, ER1, ER4, or ER5 should be used when using the TAS instruction.

Appendix B Register Field

659 DTVECR H'FF37 DTC
Figure amended

DTC Software Activation Enable

| 0 | DTC software activation is disabled <br> [Clearing conditions] <br> - When the DISEL bit is 0 and the specified number of transfers have not ended <br> - When 0 is written to the DISEL bit after a software-activated data transfer end <br> interrupt (SWDTEND) request has been sent to the CPU. |
| :--- | :--- |
| 1 | DTC software activation is enabled <br> [Holding conditions] <br> - When the DISEL bit is 1 and data transfer has ended <br> - When the specified number of transfers have ended <br> - During data transfer activated by software |

Notes: 1. A value of 1 can always be written to the SWDTE bit, but 0 can only be written after 1 is read.
2. Only write to bits DTVEC6 to DTVEC0 when SWDTE is 0 .

## Section 1 Overview

### 1.1 Overview

The H8S/2245 Group is a series of microcomputers (MCUs: microcomputer units), built around the H8S/2000 CPU, employing Renesas Technology proprietary architecture, and equipped with peripheral functions on-chip.

The H8S/2000 CPU has an internal 32-bit architecture, is provided with sixteen 16-bit general registers and a concise, optimized instruction set designed for high-speed operation, and can address a 16-Mbyte linear address space. The instruction set is upward-compatible with H8/300 and $\mathrm{H} 8 / 300 \mathrm{H}$ CPU instructions at the object-code level, facilitating migration from the $\mathrm{H} 8 / 300$, H8/300L, or H8/300H Series.

On-chip peripheral functions required for system configuration include data transfer controller (DTC) bus masters, ROM and RAM, a 16-bit timer-pulse unit (TPU), 8-bit timer, watchdog timer (WDT), serial communication interface (SCI), A/D converter, and I/O ports.

The on-chip ROM is either PROM (ZTAT ${ }^{\circledR}$ ) or mask ROM, with a capacity of 128 kbytes, 64 kbytes, or 32 kbytes. ROM is connected to the CPU via a 16 -bit data bus, enabling both byte and word data to be accessed in one state. Instruction fetching has been speeded up, and processing speed increased.

Seven operating modes, modes 1 to 7, are provided, and there is a choice of address space and single-chip mode or external expansion mode.

The features of the H8S/2245 Group are shown in table 1.1.

Note: ZTAT is a registered trademark of Renesas Technology Corp.

## Table 1.1 Overview

Item Specification

- General-register machine
- Sixteen 16-bit general registers (also usable as sixteen 8-bit registers or eight 32-bit registers)
- High-speed operation suitable for realtime control
- Maximum clock rate: 20 MHz
- High-speed arithmetic operations ( $20-\mathrm{MHz}$ operation) 8/16/32-bit register-register add/subtract: 50 ns
$16 \times 16$-bit register-register multiply: 1000 ns
$32 \div 16$-bit register-register divide: 1000 ns
- Instruction set suitable for high-speed operation
- Sixty-five basic instructions
- 8/16/32-bit move/arithmetic instructions
- Unsigned/signed multiply and divide instructions
- Powerful bit-manipulation instructions
- Two CPU operating modes
- Normal mode: 64-kbyte address space
- Advanced mode: 16-Mbyte address space

Bus controller

- Address space divided into 8 areas, with bus specifications settable independently for each area
- Chip select output possible for each area
- Choice of 8-bit or 16-bit access space for each area ( $\overline{\mathrm{CSO}}$ to $\overline{\mathrm{CS} 3})$
- 2-state or 3-state access space can be designated for each area
- Number of program wait states can be set for each area
- Burst ROM directly connectable
- External bus release function

Data transfer
controller (DTC)

- Can be activated by internal interrupt or software
- Multiple transfers or multiple types of transfer possible for one activation source
- Transfer possible in repeat mode, block transfer mode, etc.
- Request can be sent to CPU for interrupt that activated DTC

| Item | Specification |  |  |
| :---: | :---: | :---: | :---: |
| 16-bit timer-pulse unit (TPU) | - 3-channel 16-bit timer on-chip <br> - Pulse I/O processing capability for up to 8 pins' <br> - Automatic 2-phase encoder count capability <br> - 8-bit up-counter (external event count capability) <br> - Two time constant registers <br> - Two-channel connection possible |  |  |
| 8-bit timer 2 channels |  |  |  |
| Watchdog timer | - Watchdog timer or interval timer selectable <br> - Asynchronous mode or synchronous mode selectable <br> - Multiprocessor communication function <br> - Smart card interface function |  |  |
| Serial communication interface (SCI) 3 channels |  |  |  |
| A/D converter | - Resolution: 10 bits <br> - Input: 4 channels <br> - Single or scan mode selectable <br> - Sample and hold circuit <br> - A/D conversion can be activated by external trigger or timer trigger |  |  |
| I/O ports | - 75 I/O pins, 4 input-only pins |  |  |
| Memory | - PROM or mask ROM <br> - High-speed static RAM |  |  |
|  | H8S/2246 | 128 kbytes | 8 kbytes |
|  | H8S/2245 | 128 kbytes | 4 kbytes |
|  | H8S/2244 | 64 kbytes | 8 kbytes |
|  | H8S/2243 | 64 kbytes | 4 kbytes |
|  | H8S/2242 | 32 kbytes | 8 kbytes |
|  | H8S/2241 | 32 kbytes | 4 kbytes |
|  | H8S/2240 | - | 4 kbytes |

Interrupt controller

- Nine external interrupt pins (NMI, $\overline{\mathrm{IRQ0}}$ to $\overline{\mathrm{IRQ7}}$ )
- 34 internal interrupt sources
- Three priority levels settable

| Item | Specification |  |  |  |

|  |  |  |  |  |  | 1 | Mode 5 |
|  |  |  |  |  | 1 | 0 | Mode 6* |
|  |  |  |  |  |  | 1 | Mode 7* |
|  |  |  |  | Note: | $\begin{array}{ll} \text { * Car } \\ \\ & \end{array}$ | $\begin{aligned} & \text { 10t be } \\ & 2240 . \end{aligned}$ | ed in the |
| System control | $\overline{\text { RES }}$ | 62 | Input | Reset input: When this pin is driven low, the chip is reset. The type of reset can be selected according to the NMI input level. At power-on, the NMI pin input level should be set high. |  |  |  |
|  | $\overline{\text { STBY }}$ | 64 | Input | Standby: When this pin is driven low, a transition is made to hardware standby mode. |  |  |  |
|  | $\overline{\overline{\text { BREQ }}}$ | 76 | Input | Bus request: Used by an external bus master to issue a bus request to the H8S/2245 Group. |  |  |  |
|  | $\overline{\text { BREQO }}$ | 74 | Output | Bus request output: The external bus request signal used when an internal bus master accesses external space in the external bus-released state. |  |  |  |

| Type | Symbol | Pin No. | 1/0 | Name and Function |
| :---: | :---: | :---: | :---: | :---: |
|  |  | FP-100B, TFP-100B |  |  |
| System control | $\overline{\text { BACK }}$ | 75 | Output | Bus request acknowledge: Indicates that the bus has been released to an external bus master. |
| Interrupts | NMI | 63 | Input | Nonmaskable interrupt: Requests a nonmaskable interrupt. When this pin is not used, it should be fixed high. |
|  | $\begin{aligned} & \overline{\overline{\mathrm{IRQ7}} \mathrm{to}} \\ & \hline \mathrm{RQ} *^{1} \end{aligned}$ | $\begin{aligned} & 94,93,13,12, \\ & 73 \text { to } 76 \end{aligned}$ | Input | Interrupt request 7 to 0 : These pins request a maskable interrupt. |
| Address bus | $\begin{aligned} & \mathrm{A}_{23} \text { to } \\ & \mathrm{A}_{0} \end{aligned}$ | $\begin{aligned} & 2,1,100,99 \\ & 53 \text { to } 50,48 \text { to } 41, \\ & 39 \text { to } 32 \end{aligned}$ | Output | Address bus: These pins output an address. |
| Data bus | $\begin{aligned} & D_{15} \text { to } \\ & D_{0} \end{aligned}$ | 30 to 19, 17 to 14 | I/O | Data bus: These pins constitute a bidirectional data bus. |
| Bus control | $\overline{\overline{\mathrm{CS3}}} \mathrm{to}$ | 94 to 97 | Output | Chip select: Signals for selecting areas 3 to 0 . |
|  | $\overline{\overline{\mathrm{AS}}}$ | 70 | Output | Address strobe: When this pin is low, it indicates that address output on the address bus is enabled. |
|  | $\overline{\mathrm{RD}}$ | 71 | Output | Read: When this pin is low, it indicates that the external address space can be read. |
|  | $\overline{\overline{H W R}}$ | 72 | Output | High write: A strobe signal that writes to external space and indicates that the upper half ( $D_{15}$ to $D_{8}$ ) of the data bus is enabled. |
|  | $\overline{\overline{L W R}}$ | 73 | Output | Low write: A strobe signal that writes to external space and indicates that the lower half $\left(D_{7}\right.$ to $\left.D_{0}\right)$ of the data bus is enabled. |
|  | $\overline{\text { WAIT }}$ | 74 | Input | Wait: Requests insertion of a wait state in the bus cycle when accessing external 3-state address space. |

| Type | Symbol | $\frac{\text { Pin No. }}{\text { FP-100B, TFP-100B }}$ | I/O | Name and Function |
| :---: | :---: | :---: | :---: | :---: |
| 16-bit timerpulse unit (TPU) | TCLKD to TCLKA | 6, 4, 2, 1 | Input | Clock input $D$ to $A$ : These pins input an external clock. |
|  | TIOCAO, TIOCBO, TIOCCO, TIOCDO | 99, 100, 1, 2 | I/O | Input capture/output compare match A0 to D0: The TGROA to TGROD input capture input or output compare output, or PWM output pins. |
|  | TIOCA1, TIOCB1 | 3, 4 | I/O | Input capture/output compare match A1 and B1: The TGR1A and TGR1B input capture input or output compare output, or PWM output pins. |
|  | $\begin{aligned} & \text { TIOCA2, } \\ & \text { TIOCB2 } \end{aligned}$ | 5,6 | I/O | Input capture/output compare match A2 and B2: The TGR2A and TGR2B input capture input or output compare output, or PWM output pins. |
| 8-bit timer | TMOO, TMO1 | 91, 92 | Output | Compare match output: The compare match output pins. |
|  | TMCIO, <br> TMCI1 | 88, 90 | Input | Counter external clock input: Input pins for the external clock input to the counter. |
|  | TMRIO, TMRI1 | 87, 89 | Input | Counter external reset input: The counter reset input pins. |
| Watchdog timer (WDT) | WDTOVF | 60 | Output | Watchdog timer: The counter overflow signal output pin in watchdog timer mode. |
| Serial communication interface (SCI)/ Smart Card interface | $\begin{aligned} & \text { TxD2, } \\ & \text { TxD1, } \\ & \text { TxD0 } \end{aligned}$ | 54, 9, 8 | Output | Transmit data (channel 0, 1, 2): Data output pins. |
|  | $\begin{aligned} & \text { R×D2, } \\ & \text { R×D1, } \\ & \text { R×DO } \end{aligned}$ | 55, 11, 10 | Input | Receive data (channel 0, 1, 2): Data input pins. |
|  | $\begin{aligned} & \text { SCK2, } \\ & \text { SCK1, } \\ & \text { SCK0 } \end{aligned}$ | 56, 13, 12 | I/O | Serial clock (channel 0, 1, 2): Clock I/O pins. |

Pin No.

| Type | Symbol | FP-100B, TFP-100B | 1/0 | Name and Function |
| :---: | :---: | :---: | :---: | :---: |
| A/D converter | AN3 to ANO | 82 to 79 | Input | Analog 3 to 0: Analog input pins. |
|  | $\overline{\text { ADTRG }}$ | 93 | Input | A/D conversion external trigger input: Pin for input of an external trigger to start A/D conversion. |
|  | $\mathrm{AV}_{\mathrm{cc}}$ | 77 | Input | This is the power supply pin for the A/D converter. <br> When the A/D converter is not used, this pin should be connected to the system power supply (+5 V). |
|  | $\mathrm{AV}_{\text {ss }}$ | 83 | Input | This is the ground pin for the A/D converter. <br> This pin should be connected to the system power supply ( 0 V ). |
|  | $\mathrm{V}_{\text {ref }}$ | 78 | Input | This is the reference voltage input pin for the A/D converter. <br> When the A/D converter is not used, this pin should be connected to the system power supply (+5 V). |
| I/O ports | $\begin{aligned} & \mathrm{P1}_{7} \text { to } \\ & \mathrm{P}_{0} \end{aligned}$ | 6 to 1,100, 99 | I/O | Port 1: An 8-bit I/O port. Input or output can be designated for each bit by means of the port 1 data direction register (P1DDR). |
|  | $\begin{aligned} & \mathrm{P}_{7} \text { to } \\ & \mathrm{P}_{0} \end{aligned}$ | 92 to 85 | I/O | Port 2: An 8-bit I/O port. Input or output can be designated for each bit by means of the port 2 data direction register (P2DDR). |
|  | $\begin{aligned} & \mathrm{P3}_{5} \text { to } \\ & \mathrm{P} 3_{0} \end{aligned}$ | 13 to 8 | I/O | Port 3: A 6-bit I/O port. Input or output can be designated for each bit by means of the port 3 data direction register (P3DDR). |
|  | $\begin{aligned} & \mathrm{P} 4_{3} \text { to } \\ & \mathrm{P} 4_{0} \end{aligned}$ | 82 to 79 | Input | Port 4: A 4-bit input port. |
|  | $\begin{aligned} & \mathrm{P5}_{3} \text { to } \\ & \mathrm{P} 5_{0} \end{aligned}$ | 59, 56 to 54 | I/O | Port 5: A 4-bit I/O port. Input or output can be designated for each bit by means of the port 5 data direction register (P5DDR). |

| Type | Symbol | Pin No. |  |  |
| :---: | :---: | :---: | :---: | :---: |
|  |  | FP-100B, TFP-100B | I/O | Name and Function |
| I/O ports | $\begin{aligned} & \mathrm{PA}_{3} \text { to } \\ & \mathrm{PA}_{0}{ }^{* 2} \end{aligned}$ | 53 to 50 | I/O | Port A: A 4-bit I/O port. Input or output can be designated for each bit by means of the port A data direction register (PADDR). |
|  | $\begin{aligned} & \overline{\mathrm{PB}_{7} \text { to }} \\ & \mathrm{PB}_{0}^{* 3} \end{aligned}$ | 48 to 41 | I/O | Port B: An 8-bit I/O port. Input or output can be designated for each bit by means of the port B data direction register (PBDDR). |
|  | $\begin{aligned} & \hline \mathrm{PC}_{7} \text { to } \\ & \mathrm{PC}_{0}{ }^{* 3} \end{aligned}$ | 39 to 32 | I/O | Port C: An 8-bit I/O port. Input or output can be designated for each bit by means of the port C data direction register (PCDDR). |
|  | $\begin{aligned} & \overline{\mathrm{PD}_{7} \text { to }} \\ & \mathrm{PD}_{0}^{* 3} \end{aligned}$ | 30 to 23 | I/O | Port D: An 8-bit I/O port. Input or output can be designated for each bit by means of the port D data direction register (PDDDR). |
|  | $\begin{aligned} & \mathrm{PE}_{7} \text { to } \\ & \mathrm{PE}_{0} \end{aligned}$ | 22 to 19, 17 to 14 | I/O | Port E: An 8-bit I/O port. Input or output can be designated for each bit by means of the port E data direction register (PEDDR). |
|  | $\begin{aligned} & \overline{\mathrm{PF}_{7} \text { to }} \\ & \mathrm{PF}_{0}^{* *} \end{aligned}$ | 69 to 76 | I/O | Port F: An 8-bit I/O port. Input or output can be designated for each bit by means of the port $F$ data direction register (PFDDR). |
|  | $\begin{aligned} & \mathrm{PG}_{4} \text { o } \\ & \mathrm{PG}_{0} \end{aligned}$ | 97 to 93 | I/O | Port G: A 5-bit I/O port. Input or output can be designated for each bit by means of the port $G$ data direction register (PGDDR). |

[^0]2. Cannot be used in modes 4 and 5 in the $\mathrm{H} 8 \mathrm{~S} / 2240$.
3. Cannot be used in the H8S/2240.
4. $\mathrm{PF}_{6}$ to $\mathrm{PF}_{3}$ cannot be used in the $\mathrm{H} 8 \mathrm{~S} / 2240$.

## Section 2 CPU

### 2.1 Overview

The H8S/2000 CPU is a high-speed central processing unit with an internal 32-bit architecture that is upward-compatible with the $\mathrm{H} 8 / 300$ and $\mathrm{H} 8 / 300 \mathrm{H}$ CPUs. The H8S/2000 CPU has sixteen 16-bit general registers, can address a 16-Mbyte (architecturally 4-Gbyte) linear address space, and is ideal for realtime control.

### 2.1.1 Features

The H8S/2000 CPU has the following features.

- Upward-compatible with $\mathrm{H} 8 / 300$ and $\mathrm{H} 8 / 300 \mathrm{H}$ CPUs
- Can execute H8/300 and H8/300H object programs
- General-register architecture
- Sixteen 16-bit general registers (also usable as sixteen 8-bit registers or eight 32-bit registers)
- Sixty-five basic instructions
- 8/16/32-bit arithmetic instructions
- Multiply and divide instructions
- Powerful bit-manipulation instructions
- Eight addressing modes
— Register direct [Rn]
— Register indirect [@ERn]
— Register indirect with displacement [@(d:16,ERn) or @(d:32,ERn)]
— Register indirect with post-increment or pre-decrement [@ERn+ or @-ERn]
— Absolute address [@aa:8, @aa:16, @aa:24, or @aa:32]
— Immediate [\#xx:8, \#xx:16, or \#xx:32]
— Program-counter relative [@(d:8,PC) or @(d:16,PC)]
— Memory indirect [@ @aa:8]
- 16-Mbyte address space
- Program: 16 Mbytes
- Data: 16 Mbytes (4 Gbytes architecturally)
- High-speed operation
- All frequently-used instructions execute in one or two states
- Maximum clock rate:
- 8/16/32-bit register-register add/subtract: 50 ns (20-MHz operation)
- $8 \times 8$-bit register-register multiply: $\quad 600 \mathrm{~ns}$ (20-MHz operation)
- $16 \div 8$-bit register-register divide: $\quad 600 \mathrm{~ns}(20-\mathrm{MHz}$ operation)
- $16 \times 16$-bit register-register multiply: $\quad 1000 \mathrm{~ns}$ (20-MHz operation)
- $32 \div 16$-bit register-register divide: $\quad 1000 \mathrm{~ns}$ (20-MHz operation)
- Two CPU operating modes
- Normal mode
- Advanced mode
- Power-down state
- Transition to power-down state by SLEEP instruction
- CPU clock speed selection

### 2.1.2 Differences between H8S/2600 CPU and H8S/2000 CPU

The differences between the H8S/2600 CPU and the H8S/2000 CPU are as shown below.

- Register configuration

The MAC register is supported only by the H8S/2600 CPU.

- Basic instructions

The four instructions MAC, CLRMAC, LDMAC, and STMAC are supported only by the H8S/2600 CPU.

- Number of execution states

The number of execution states of the MULXU and MULXS instructions.
Internal Operation

| Instruction | Mnemonic | H8S/2600 | H8S/2000 |
| :--- | :--- | :--- | :--- |
| MULXU | MULXU.B Rs, Rd | 3 | 12 |
|  | MULXU.W Rs, ERd | 4 | 20 |
| MULXS | MULXS.B Rs, Rd | 4 | 13 |
|  | MULXS.W Rs, ERd | 5 | 21 |

There are also differences in the address space, EXR register functions, power-down state, etc., depending on the product.

### 2.1.3 Differences from H8/300 CPU

In comparison to the $\mathrm{H} 8 / 300 \mathrm{CPU}$, the $\mathrm{H} 8 \mathrm{~S} / 2000 \mathrm{CPU}$ has the following enhancements.

- More general registers and control registers
- Eight 16-bit expanded registers, and one 8-bit control registers, have been added.
- Expanded address space
- Normal mode supports the same 64-kbyte address space as the H8/300 CPU .
- Advanced mode supports a maximum 16-Mbyte address space.
- Enhanced addressing
- The addressing modes have been enhanced to make effective use of the 16-Mbyte address space.
- Enhanced instructions
- Addressing modes of bit-manipulation instructions have been enhanced.
- Signed multiply and divide instructions have been added.
- Two-bit shift instructions have been added.
- Instructions for saving and restoring multiple registers have been added.
- A test and set instruction has been added.
- Higher speed
- Basic instructions execute twice as fast.

### 2.1.4 Differences from H8/300H CPU

In comparison to the $\mathrm{H} 8 / 300 \mathrm{H}$ CPU, the $\mathrm{H} 8 \mathrm{~S} / 2000 \mathrm{CPU}$ has the following enhancements.

- Additional control register
- One 8-bit control register has been added.
- Enhanced instructions
- Addressing modes of bit-manipulation instructions have been enhanced.
- Two-bit shift instructions have been added.
- Instructions for saving and restoring multiple registers have been added.
- A test and set instruction has been added.
- Higher speed
- Basic instructions execute twice as fast.

### 2.2 CPU Operating Modes

The H8S/2000 CPU has two operating modes: normal and advanced. Normal mode supports a maximum 64-kbyte address space. Advanced mode supports a maximum 16-Mbyte total address space (architecturally a maximum 16-Mbyte program area and a maximum of 4 Gbytes for program and data areas combined). The mode is selected by the mode pins of the microcontroller.

## Figure 2.1 CPU Operating Modes

(1) Normal Mode

The exception vector table and stack have the same structure as in the $\mathrm{H} 8 / 300$ CPU.
Address Space: A maximum address space of 64 kbytes can be accessed.
Extended Registers (En): The extended registers (E0 to E7) can be used as 16-bit registers, or as the upper 16 -bit segments of 32 -bit registers. When En is used as a 16 -bit register it can contain any value, even when the corresponding general register ( Rn ) is used as an address register. If the general register is referenced in the register indirect addressing mode with pre-decrement (@-Rn) or post-increment ( $@ \mathrm{Rn}+$ ) and a carry or borrow occurs, however, the value in the corresponding extended register (En) will be affected.

Instruction Set: All instructions and addressing modes can be used. Only the lower 16 bits of effective addresses (EA) are valid.

Exception Vector Table and Memory Indirect Branch Addresses: In normal mode the top area starting at $\mathrm{H}^{\prime} 0000$ is allocated to the exception vector table. One branch address is stored per 16 bits (figure 2.2). The exception vector table differs depending on the microcontroller. For details of the exception vector table, see section 4, Exception Handling.

Figure 2.2 Exception Vector Table (Normal Mode)
The memory indirect addressing mode ( @ @aa:8) employed in the JMP and JSR instructions uses an 8-bit absolute address included in the instruction code to specify a memory operand that contains a branch address. In normal mode the operand is a 16 -bit word operand, providing a 16 bit branch address. Branch addresses can be stored in the top area from H'0000 to H'00FF. Note that this area is also used for the exception vector table.

Stack Structure: When the program counter (PC) is pushed onto the stack in a subroutine call, and the PC and condition-code register (CCR) are pushed onto the stack in exception handling, they are stored as shown in figure 2.3. The extended control register (EXR) is not pushed onto the stack. For details, see section 4, Exception Handling.

Figure 2.3 Stack Structure in Normal Mode

## (2) Advanced Mode

Address Space: Linear access is provided to a $16-\mathrm{Mbyte}$ maximum address space (architecturally a maximum 16-Mbyte program area and a maximum 4-Gbyte data area, with a maximum of 4 Gbytes for program and data areas combined).

Extended Registers (En): The extended registers (E0 to E7) can be used as 16-bit registers, or as the upper 16-bit segments of 32-bit registers or address registers.

Instruction Set: All instructions and addressing modes can be used.

Exception Vector Table and Memory Indirect Branch Addresses: In advanced mode the top area starting at $\mathrm{H}^{\prime} 00000000$ is allocated to the exception vector table in units of 32 bits. In each 32 bits, the upper 8 bits are ignored and a branch address is stored in the lower 24 bits (figure 2.4). For details of the exception vector table, see section 4, Exception Handling.

Figure 2.4 Exception Vector Table (Advanced Mode)
The memory indirect addressing mode (@ @aa:8) employed in the JMP and JSR instructions uses an 8-bit absolute address included in the instruction code to specify a memory operand that contains a branch address. In advanced mode the operand is a 32 -bit longword operand, providing a 32-bit branch address. The upper 8 bits of these 32 bits are a reserved area that is regarded as $\mathrm{H}^{\prime} 00$. Branch addresses can be stored in the area from H'00000000 to H'000000FF. Note that the first part of this range is also the exception vector table.

Stack Structure: In advanced mode, when the program counter (PC) is pushed onto the stack in a subroutine call, and the PC and condition-code register (CCR) are pushed onto the stack in exception handling, they are stored as shown in figure 2.5. The extended control register (EXR) is not pushed onto the stack. For details, see section 4, Exception Handling.

Figure 2.5 Stack Structure in Advanced Mode

### 2.3 Address Space

Figure 2.6 shows a memory map of the H8S/2000 CPU. The H8S/2000 CPU provides linear access to a maximum 64-kbyte address space in normal mode, and a maximum 16-Mbyte (architecturally 4-Gbyte) address space in advanced mode. The usable modes and address spaces differ depending on the product. For details on each product, see section 3, MCU Operating Modes.

Figure 2.6 Memory Map

### 2.4 Register Configuration

### 2.4.1 Overview

The CPU has the internal registers shown in figure 2.7. There are two types of registers: general registers and control registers.

General Registers (Rn) and Extended Registers (En)

|  |  | 07 | 07 | 0 |
| :---: | :---: | :---: | :---: | :---: |
| ER0 | E0 | ROH | ROL |  |
| ER1 | E1 | R1H | R1L |  |
| ER2 | E2 | R2H | R2L |  |
| ER3 | E3 | R3H | R3L |  |
| ER4 | E4 | R4H | R4L |  |
| ER5 | E5 | R5H | R5L |  |
| ER6 | E6 | R6H | R6L |  |
| ER7 (SP) | E7 | R7H | R7L |  |

## Control Registers (CR)

$$
\begin{aligned}
& 23 \text { PC }
\end{aligned}
$$

Legend:

SP: Stack pointer
H: Half-carry flag
PC: Program counter
EXR: Extended control register
T: Trace bit
I2 to 10: Interrupt mask bits
CCR: Condition-code register
I: Interrupt mask bit
UI: User bit or interrupt mask bit

U: User bit
$\mathrm{N}: \quad$ Negative flag
Z: Zero flag
V: Overflow flag
C: Carry flag
O.

Note: * This register does not affect operations in the H8S/2245 Group.
Figure 2.7 CPU Registers

### 2.4.2 General Registers

The CPU has eight 32 -bit general registers. These general registers are all functionally alike and can be used as both address registers and data registers. When a general register is used as a data register, it can be accessed as a 32 -bit, 16 -bit, or 8 -bit register. When the general registers are used as 32-bit registers or address registers, they are designated by the letters ER (ER0 to ER7).

The ER registers divide into 16-bit general registers designated by the letters E (E0 to E7) and R (R0 to R7). These registers are functionally equivalent, providing a maximum sixteen 16-bit registers. The E registers (E0 to E7) are also referred to as extended registers.

The R registers divide into 8 -bit general registers designated by the letters RH ( R 0 H to R 7 H ) and RL (R0L to R7L). These registers are functionally equivalent, providing a maximum sixteen 8 -bit registers.

Figure 2.8 illustrates the usage of the general registers. The usage of each register can be selected independently.

Figure 2.8 Usage of General Registers
General register ER7 has the function of stack pointer (SP) in addition to its general-register function, and is used implicitly in exception handling and subroutine calls. Figure 2.9 shows the stack.

Figure 2.9 Stack

### 2.4.3 Control Registers

The control registers are the 24-bit program counter (PC), 8-bit extended control register (EXR), and 8 -bit condition-code register (CCR).

## (1) Program Counter (PC)

This 24-bit counter indicates the address of the next instruction the CPU will execute. The length of all CPU instructions is 2 bytes (one word) so the least significant PC bit is ignored. (When an instruction is read, the least significant PC bit is regarded as 0 .)

## (2) Extended Control Register (EXR)

This 8-bit register does not affect operation in the H8S/2245 Group.
Bit 7—Trace Bit (T): This bit is reserved. It does not affect operation in the H8S/2245 Group.
Bits 6 to 3-Reserved: These bits are reserved. They are always read as 1 .
Bits 2 to 0—Interrupt Mask Bits (I2 to I0): These bits are reserved. They do not affect operation in the H8S/2245 Group.

## (3) Condition-Code Register (CCR)

This 8-bit register contains internal CPU status information, including an interrupt mask bit (I) and half-carry $(\mathrm{H})$, negative $(\mathrm{N})$, zero (Z), overflow (V), and carry (C) flags.

Bit 7—Interrupt Mask Bit (I): Masks interrupts other than NMI when set to 1 . (NMI is accepted regardless of the I bit setting.) The I bit is set to 1 by hardware at the start of an exceptionhandling sequence. For details, refer to section 5, Interrupt Controller.

Bit 6-User Bit or Interrupt Mask Bit (UI): Can be written and read by software using the LDC, STC, ANDC, ORC, and XORC instructions. This bit can also be used as an interrupt mask bit. For details, refer to section 5, Interrupt Controller.

Bit 5-Half-Carry Flag (H): When the ADD.B, ADDX.B, SUB.B, SUBX.B, CMP.B, or NEG.B instruction is executed, this flag is set to 1 if there is a carry or borrow at bit 3 , and cleared to 0 otherwise. When the ADD.W, SUB.W, CMP.W, or NEG.W instruction is executed, the H flag is set to 1 if there is a carry or borrow at bit 11 , and cleared to 0 otherwise. When the ADD.L, SUB.L, CMP.L, or NEG.L instruction is executed, the H flag is set to 1 if there is a carry or borrow at bit 27, and cleared to 0 otherwise.

Bit 4-User Bit (U): Can be written and read by software using the LDC, STC, ANDC, ORC, and XORC instructions.

Bit 3-Negative Flag (N): Stores the value of the most significant bit (sign bit) of data.
Bit 2-Zero Flag (Z): Set to 1 to indicate zero data, and cleared to 0 to indicate non-zero data.
Bit 1—Overflow Flag (V): Set to 1 when an arithmetic overflow occurs, and cleared to 0 at other times.

Bit 0-Carry Flag (C): Set to 1 when a carry occurs, and cleared to 0 otherwise. Used by:

- Add instructions, to indicate a carry
- Subtract instructions, to indicate a borrow
- Shift and rotate instructions, to indicate a carry

The carry flag is also used as a bit accumulator by bit manipulation instructions.

Some instructions leave some or all of the flag bits unchanged. For the action of each instruction on the flag bits, refer to appendix A.1, Instruction List.

Operations can be performed on the CCR bits by the LDC, STC, ANDC, ORC, and XORC instructions. The N, Z, V, and C flags are used as branching conditions for conditional branch (Bcc) instructions.

### 2.4.4 Initial Register Values

Reset exception handling loads the CPU's program counter (PC) from the vector table, clears the trace bit in EXR to 0 , and sets the interrupt mask bits in CCR and EXR to 1 . The other CCR bits and the general registers are not initialized. In particular, the stack pointer (ER7) is not initialized. The stack pointer should therefore be initialized by an MOV.L instruction executed immediately after a reset.

### 2.5 Data Formats

The CPU can process 1-bit, 4-bit (BCD), 8-bit (byte), 16-bit (word), and 32-bit (longword) data. Bit-manipulation instructions operate on 1 -bit data by accessing bit $n(n=0,1,2, \ldots, 7)$ of byte operand data. The DAA and DAS decimal-adjust instructions treat byte data as two digits of 4-bit $B C D$ data.

### 2.5.1 General Register Data Formats

Figure 2.10 shows the data formats in general registers.

Figure 2.10 General Register Data Formats

Figure 2.10 General Register Data Formats (cont)

### 2.5.2 Memory Data Formats

Figure 2.11 shows the data formats in memory. The CPU can access word data and longword data in memory, but word or longword data must begin at an even address. If an attempt is made to access word or longword data at an odd address, no address error occurs but the least significant bit of the address is regarded as 0 , so the access starts at the preceding address. This also applies to instruction fetches.

Figure 2.11 Memory Data Formats
When $\operatorname{SP}(E R 7)$ is used as an address register to access the stack, the operand size should be word size or longword size.

### 2.6 Instruction Set

### 2.6.1 Overview

The H8S/2000 CPU has 65 types of instructions. The instructions are classified by function in table 2.1.

Table 2.1 Instruction Classification

| Function | Instructions | Size | Types |
| :---: | :---: | :---: | :---: |
| Data transfer | MOV | BWL | 5 |
|  | POP*1, PUSH*1 | WL |  |
|  | LDM* ${ }^{5}$, STM ${ }^{* 5}$ | L |  |
|  | MOVFPE* ${ }^{3}$, MOVTPE* ${ }^{3}$ | B |  |
| Arithmetic operations | ADD, SUB, CMP, NEG | BWL | 19 |
|  | ADDX, SUBX, DAA, DAS | B |  |
|  | INC, DEC | BWL |  |
|  | ADDS, SUBS | L |  |
|  | MULXU, DIVXU, MULXS, DIVXS | BW |  |
|  | EXTU, EXTS | WL |  |
|  | TAS** | B |  |
| Logic operations | AND, OR, XOR, NOT | BWL | 4 |
| Shift | SHAL, SHAR, SHLL, SHLR, ROTL, ROTR, ROTXL, ROTXR | BWL | 8 |
| Bit manipulation | BSET, BCLR, BNOT, BTST, BLD, BILD, BST, BIST, BAND, BIAND, BOR, BIOR, BXOR, BIXOR | B | 14 |
| Branch | Bcc**2, JMP, BSR, JSR, RTS | - | 5 |
| System control | TRAPA, RTE, SLEEP, LDC, STC, ANDC, ORC, XORC, NOP | - | 9 |
| Block data transfer | EEPMOV | - | 1 |

Total: 65 types
Legend:
B: Byte size
W: Word size
L: Longword size
Notes: 1. POP.W Rn and PUSH.W Rn are identical to MOV.W @SP+, Rn and MOV.W Rn, @-SP. POP.L ERn and PUSH.L ERn are identical to MOV.L @SP+, ERn and MOV.L ERn, @-SP.
2. Bcc is the general name for conditional branch instructions.
3. Cannot be used in the H8S/2245 Group.
4. Only register ER0, ER1, ER4, or ER5 should be used when using the TAS instruction.
5. Only register ER0 to ER6 should be used when using the STM/LDM instruction.

### 2.6.2 Instructions and Addressing Modes

Table 2.2 indicates the combinations of instructions and addressing modes that the H8S/2000 CPU can use.

Table 2.2 Combinations of Instructions and Addressing Modes

| Function | Instruction | Addressing Modes |  |  |  |  |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | $\underset{\text { ج }}{\times}$ | $\underset{\sim}{\text { ¢ }}$ |  |  |  |  |  |  | $\begin{aligned} & \stackrel{\rightharpoonup}{\underset{W}{\tilde{0}}} \\ & \text { ®̈) } \end{aligned}$ | $\begin{aligned} & \text { N్ల } \\ & \stackrel{\pi}{\pi} \\ & \text { BOU } \end{aligned}$ | $\begin{aligned} & \text { O} \\ & 0 \\ & \text { 0 } \\ & \text { (8) } \end{aligned}$ |  |  | 1 |
| Data transfer | MOV | BWL | BWL | BWL | BWL | BWL | BWL | B | BWL | - | BWL | - | - | - | - |
|  | POP, PUSH | - | - | - | - | - | - | - | - | - | - | - | - | - | WL |
|  | LDM, STM | - | - | - | - | - | - | - | - | - | - | - | - | - | L |
|  | MOVFPE*, MOVTPE* | - | - | - | - | - | - | - | B | - | - | - | - | - | - |
| Arithmetic operations | ADD, CMP | BWL | BWL | - | - | - | - | - | - | - | - | - | - | - | - |
|  | SUB | WL | BWL | - | - | - | - | - | - | - | - | - | - | - | - |
|  | ADDX, SUBX | B | B | - | - | - | - | - | - | - | - | - | - | - | - |
|  | ADDS, SUBS | - | L | - | - | - | - | - | - | - | - | - | - | - | - |
|  | INC, DEC | - | BWL | - | - | - | - | - | - | - | - | - | - | - | - |
|  | DAA, DAS | - | B | - | - | - | - | - | - | - | - | - | - | - | - |

### 2.6.3 Table of Instructions Classified by Function

Tables 2.3 to 2.10 summarize the instructions in each functional category. The notation used in the tables is defined below.

## Operation Notation

| Rd | General register (destination)* |
| :---: | :---: |
| Rs | General register (source)* |
| Rn | General register* |
| ERn | General register (32-bit register) |
| (EAd) | Destination operand |
| (EAs) | Source operand |
| EXR | Extended control register |
| CCR | Condition-code register |
| N | N (negative) flag in CCR |
| Z | Z (zero) flag in CCR |
| V | $V$ (overflow) flag in CCR |
| C | C (carry) flag in CCR |
| PC | Program counter |
| SP | Stack pointer |
| \#IMM | Immediate data |
| disp | Displacement |
| + | Addition |
| - | Subtraction |
| $\times$ | Multiplication |
| $\div$ | Division |
| $\wedge$ | Logical AND |
| $v$ | Logical OR |
| $\oplus$ | Logical exclusive OR |
| $\rightarrow$ | Move |
| ᄀ | NOT (logical complement) |
| :8/:16/:24/:32 | 8-, 16-, 24-, or 32-bit length |
| Note: $* \quad$ General registers include 8-bit registers (R  <br>   to R7, E0 to E7), and 32-bit registers (ER0 |  |

Table 2.3 Data Transfer Instructions

| Instruction | Size*1 | Function |
| :--- | :--- | :--- |
| MOV | B/W/L | (EAs) $\rightarrow$ Rd, Rs $\rightarrow$ (EAd) <br> Moves data between two general registers or between a general register <br> and memory, or moves immediate data to a general register. |
| MOVFPE | B | Cannot be used in the H8S/2245 Group. |
| MOVTPE | B | Cannot be used in the H8S/2245 Group. |
| POP | W/L | @SP+ $\rightarrow$ Rn <br> Pops a register from the stack. POP.W Rn is identical to MOV.W @SP+, <br> Rn. POP.L ERn is identical to MOV.L @SP+, ERn. |
| PUSH | W/L | Rn $\rightarrow$ @-SP <br> Pushes a register onto the stack. PUSH.W Rn is identical to MOV.W Rn, <br> @ - SP. PUSH.L ERn is identical to MOV.L ERn, @-SP. |
| LDM*2 | L | @SP+ $\rightarrow$ Rn (register list) <br> Pops two or more general registers from the stack. |
| ${\text { STM }{ }^{* 2}}^{\text {L }}$Rn (register list) $\rightarrow$ @-SP <br> Pushes two or more general registers onto the stack. |  |  |

Notes: 1. Size refers to the operand size.
B: Byte
W: Word
L: Longword
2. Only register ERO to ER6 should be used when using the STM/LDM instruction.

## Table 2.4 Arithmetic Operation Instructions

| Instruction | Size** | Function |
| :---: | :---: | :---: |
| $\begin{aligned} & \text { ADD } \\ & \text { SUB } \end{aligned}$ | B/W/L | $\mathrm{Rd} \pm \mathrm{Rs} \rightarrow \mathrm{Rd}, \mathrm{Rd} \pm \# \mathrm{IMM} \rightarrow \mathrm{Rd}$ <br> Performs addition or subtraction on data in two general registers, or on immediate data and data in a general register. (Immediate byte data cannot be subtracted from byte data in a general register. Use the SUBX or ADD instruction.) |
| $\begin{aligned} & \hline \text { ADDX } \\ & \text { SUBX } \end{aligned}$ | B | $R d \pm R s \pm C \rightarrow R d, \quad R d \pm \# I M M \pm C \rightarrow R d$ <br> Performs addition or subtraction with carry or borrow on byte data in two general registers, or on immediate data and data in a general register. |
| $\begin{aligned} & \hline \text { INC } \\ & \text { DEC } \end{aligned}$ | B/W/L | $\mathrm{Rd} \pm 1 \rightarrow \mathrm{Rd}, \quad \mathrm{Rd} \pm 2 \rightarrow \mathrm{Rd}$ <br> Increments or decrements a general register by 1 or 2. (Byte operands can be incremented or decremented by 1 only.) |
| ADDS <br> SUBS | L | $\mathrm{Rd} \pm 1 \rightarrow \mathrm{Rd}, \quad \mathrm{Rd} \pm 2 \rightarrow \mathrm{Rd}, \quad \mathrm{Rd} \pm 4 \rightarrow \mathrm{Rd}$ <br> Adds or subtracts the value 1, 2, or 4 to or from data in a 32-bit register. |
| $\begin{aligned} & \hline \text { DAA } \\ & \text { DAS } \end{aligned}$ | B | Rd decimal adjust $\rightarrow$ Rd Decimal-adjusts an addition or subtraction result in a general register by referring to the CCR to produce 4-bit BCD data. |
| MULXU | B/W | $\mathrm{Rd} \times \mathrm{Rs} \rightarrow \mathrm{Rd}$ <br> Performs unsigned multiplication on data in two general registers: either 8 bits $\times 8$ bits $\rightarrow 16$ bits or 16 bits $\times 16$ bits $\rightarrow 32$ bits. |
| MULXS | B/W | $\mathrm{Rd} \times \mathrm{Rs} \rightarrow \mathrm{Rd}$ <br> Performs signed multiplication on data in two general registers: either 8 bits $\times 8$ bits $\rightarrow 16$ bits or 16 bits $\times 16$ bits $\rightarrow 32$ bits. |
| $\overline{\text { DIVXU }}$ | B/W | $\mathrm{Rd} \div \mathrm{Rs} \rightarrow \mathrm{Rd}$ <br> Performs unsigned division on data in two general registers: either 16 bits $\div 8$ bits $\rightarrow 8$-bit quotient and 8 -bit remainder or 32 bits $\div 16$ bits $\rightarrow$ 16 -bit quotient and 16 -bit remainder. |
| DIVXS | B/W | $\mathrm{Rd} \div \mathrm{Rs} \rightarrow \mathrm{Rd}$ <br> Performs signed division on data in two general registers: either 16 bits $\div 8$ bits $\rightarrow 8$-bit quotient and 8 -bit remainder or 32 bits $\div 16$ bits $\rightarrow 16$-bit quotient and 16-bit remainder. |
| CMP | B/W/L | Rd - Rs, Rd - \#IMM <br> Compares data in a general register with data in another general register or with immediate data, and sets CCR bits according to the result. |
| $\overline{N E G}$ | B/W/L | $0-R d \rightarrow R d$ <br> Takes the two's complement (arithmetic complement) of data in a general register. |

| Instruction | Size* $^{* 1}$ | Function |
| :--- | :--- | :--- |
| EXTU | W/L | Rd (zero extension) $\rightarrow$ Rd <br> Extends the lower 8 bits of a 16-bit register to word size, or the lower 16 <br> bits of a 32-bit register to longword size, by padding with zeros on the <br> left. |
| EXTS | W/L | Rd (sign extension) $\rightarrow$ Rd <br> Extends the lower 8 bits of a 16-bit register to word size, or the lower 16 <br> bits of a 32-bit register to longword size, by extending the sign bit. |
| TAS*2 $^{2}$ | B | @ERd $-0,1 \rightarrow$ (<bit 7> of @Erd) <br> Tests memory contents, and sets the most significant bit (bit 7) to 1. |

Notes: 1. Size refers to the operand size.
B: Byte
W: Word
L: Longword
2. Only register ER0, ER1, ER4, or ER5 should be used when using the TAS instruction.

## Table 2.5 Logic Operations Instructions

## Instruction Size* Function

| AND | B/W/L | $R d \wedge R s \rightarrow R d, R d \wedge \# I M M \rightarrow R d$ <br> Performs a logical AND operation on a general register and another general register or immediate data. |
| :---: | :---: | :---: |
| $\overline{O R}$ | B/W/L | $R d \vee R s \rightarrow R d, R d \vee \# I M M \rightarrow R d$ <br> Performs a logical OR operation on a general register and another general register or immediate data. |
| XOR | B/W/L | $\mathrm{Rd} \oplus \mathrm{Rs} \rightarrow \mathrm{Rd}, \quad \mathrm{Rd} \oplus \# \mathrm{IMM} \rightarrow \mathrm{Rd}$ <br> Performs a logical exclusive OR operation on a general register and another general register or immediate data. |
| NOT | B/W/L | $\neg \mathrm{Rd} \rightarrow \mathrm{Rd}$ <br> Takes the one's complement of general register contents. |

Note: * Size refers to the operand size.
B: Byte
W: Word
L: Longword

Table 2.6 Shift Operations Instructions

| Instruction | Size* | Function |
| :--- | :--- | :--- |
| SHAL | B/W/L | Rd (shift) $\rightarrow$ Rd <br> Performs an arithmetic shift on general register contents. <br> 1-bit or 2-bit shift is possible. |
| SHAR | B/W/L | Rd (shift) $\rightarrow$ Rd <br> Performs a logical shift on general register contents. <br> 1-bit or 2-bit shift is possible. |
| SHLL | BHLR | Rd (rotate) $\rightarrow$ Rd <br> Rotates general register contents. <br> 1-bit or 2-bit rotation is possible. |
| ROTL | BOTR | Rd (rotate) $\rightarrow$ Rd <br> Rotates general register contents through the carry flag. <br> 1-bit or 2-bit rotation is possible. |
| ROTXL | B/W/L |  |

Note: * Size refers to the operand size.
B: Byte
W: Word
L: Longword

## Table 2.7 Bit-Manipulation Instructions

| Instruction | Size* | Function |
| :---: | :---: | :---: |
| BSET | B | $1 \rightarrow \text { (<bit-No.> of <EAd>) }$ <br> Sets a specified bit in a general register or memory operand to 1 . The bit number is specified by 3-bit immediate data or the lower three bits of a general register. |
| BCLR | B | $0 \rightarrow$ (<bit-No.> of <EAd>) <br> Clears a specified bit in a general register or memory operand to 0 . The bit number is specified by 3-bit immediate data or the lower three bits of a general register. |
| BNOT | B | $\neg(<\text { bit-No.> of <EAd>) } \rightarrow \text { (<bit-No.> of <EAd>) }$ <br> Inverts a specified bit in a general register or memory operand. The bit number is specified by 3 -bit immediate data or the lower three bits of a general register. |
| BTST | B | $\neg(<\text { bit-No. }>\text { of }<\text { EAd }>) \rightarrow Z$ <br> Tests a specified bit in a general register or memory operand and sets or clears the Z flag accordingly. The bit number is specified by 3 -bit immediate data or the lower three bits of a general register. |
| BAND | B | $\mathrm{C} \wedge(<\text { bit-No.> of }<\mathrm{EAd}>) \rightarrow \mathrm{C}$ <br> ANDs the carry flag with a specified bit in a general register or memory operand and stores the result in the carry flag. |
| BIAND | B | $\mathrm{C} \wedge \neg(<b i t-N o .>$ of $<\mathrm{EAd}>$ ) $\rightarrow \mathrm{C}$ <br> ANDs the carry flag with the inverse of a specified bit in a general register or memory operand and stores the result in the carry flag. The bit number is specified by 3 -bit immediate data. |
| BOR | B | $C \vee(<\text { bit-No. }>\text { of }<E A d>) \rightarrow C$ <br> ORs the carry flag with a specified bit in a general register or memory operand and stores the result in the carry flag. |
| BIOR | B | $C \vee[\neg$ (<bit-No.> of <EAd>) $] \rightarrow$ C <br> ORs the carry flag with the inverse of a specified bit in a general register or memory operand and stores the result in the carry flag. <br> The bit number is specified by 3 -bit immediate data. |

Instruction Size* Function

| BXOR | B | $\mathrm{C} \oplus(<$ bit-No.> of $<\mathrm{EAd}>$ ) $\rightarrow \mathrm{C}$ <br> Exclusive-ORs the carry flag with a specified bit in a general register or memory operand and stores the result in the carry flag. |
| :---: | :---: | :---: |
| BIXOR | B | $C \oplus[\neg(<$ bit-No. $>$ of $<$ EAd $>)] \rightarrow C$ <br> Exclusive-ORs the carry flag with the inverse of a specified bit in a general register or memory operand and stores the result in the carry flag. |
|  |  | The bit number is specified by 3-bit immediate data. |

BLD B $\quad$| (<bit-No. $>$ of $<E A d>) \rightarrow$ C |
| :--- |
| Transfers a specified bit in a general register or memory operand to the | carry flag.

BILD
B $\quad \neg$ (<bit-No.> of <EAd>) $\rightarrow$ C
Transfers the inverse of a specified bit in a general register or memory operand to the carry flag.
The bit number is specified by 3 -bit immediate data.
BST B $\quad$ C $\rightarrow$ (<bit-No.> of <EAd>)

Transfers the carry flag value to a specified bit in a general register or memory operand.
BIST
B $\quad \neg$ C $\rightarrow$ (<bit-No.> of <EAd>)
Transfers the inverse of the carry flag value to a specified bit in a general register or memory operand.
The bit number is specified by 3 -bit immediate data.
Note: * Size refers to the operand size.
B: Byte

Table 2.8 Branch Instructions

| Instruction | Size | Function |  |  |
| :---: | :---: | :---: | :---: | :---: |
| Bcc | - | Branches to a specified address if a specified condition is true. The branching conditions are listed below. |  |  |
|  |  | Mnemonic | Description | Condition |
|  |  | BRA(BT) | Always (true) | Always |
|  |  | BRN(BF) | Never (false) | Never |
|  |  | BHI | High | $C \vee Z=0$ |
|  |  | BLS | Low or same | $C \vee Z=1$ |
|  |  | BCC(BHS) | Carry clear (high or same) | $\mathrm{C}=0$ |
|  |  | BCS(BLO) | Carry set (low) | $C=1$ |
|  |  | BNE | Not equal | $\mathrm{Z}=0$ |
|  |  | BEQ | Equal | $\mathrm{Z}=1$ |
|  |  | BVC | Overflow clear | $\mathrm{V}=0$ |
|  |  | BVS | Overflow set | $V=1$ |
|  |  | BPL | Plus | $\mathrm{N}=0$ |
|  |  | BMI | Minus | $\mathrm{N}=1$ |
|  |  | BGE | Greater or equal | $\mathrm{N} \oplus \mathrm{V}=0$ |
|  |  | BLT | Less than | $\mathrm{N} \oplus \mathrm{V}=1$ |
|  |  | BGT | Greater than | $\mathrm{Z} \vee(\mathrm{N} \oplus \mathrm{V})=0$ |
|  |  | BLE | Less or equal | $\mathrm{Z} \vee(\mathrm{N} \oplus \mathrm{V})=1$ |

| JMP | - | Branches unconditionally to a specified address. |
| :--- | :--- | :--- |
| BSR | - | Branches to a subroutine at a specified address. |
| JSR | - | Branches to a subroutine at a specified address. |
| RTS | - | Returns from a subroutine |

Table 2.9 System Control Instructions

| Instruction | Size* | Function |
| :---: | :---: | :---: |
| TRAPA | - | Starts trap-instruction exception handling. |
| RTE | - | Returns from an exception-handling routine. |
| SLEEP | - | Causes a transition to a power-down state. |
| LDC | B/W | $(E A s) \rightarrow \text { CCR, (EAs) } \rightarrow \text { EXR }$ <br> Moves the source operand contents or immediate data to CCR or EXR. Although CCR and EXR are 8-bit registers, word-size transfers are performed between them and memory. The upper 8 bits are valid. |
| STC | B/W | $\mathrm{CCR} \rightarrow(\mathrm{EAd}), \mathrm{EXR} \rightarrow(\mathrm{EAd})$ <br> Transfers CCR or EXR contents to a general register or memory. Although CCR and EXR are 8-bit registers, word-size transfers are performed between them and memory. The upper 8 bits are valid. |
| ANDC | B | CCR $\wedge$ \#IMM $\rightarrow$ CCR, EXR $\wedge$ \#IMM $\rightarrow$ EXR <br> Logically ANDs the CCR or EXR contents with immediate data. |
| ORC | B | CCR $\vee$ \#IMM $\rightarrow$ CCR, EXR $\vee$ \#IMM $\rightarrow$ EXR <br> Logically ORs the CCR or EXR contents with immediate data. |
| XORC | B | CCR $\oplus$ \#IMM $\rightarrow$ CCR, EXR $\oplus$ \#IMM $\rightarrow$ EXR <br> Logically exclusive-ORs the CCR or EXR contents with immediate data. |
| NOP | - | $\mathrm{PC}+2 \rightarrow \mathrm{PC}$ <br> Only increments the program counter. |
| Note: | Size refers to the operand size. <br> B: Byte <br> W: Word |  |

Table 2.10 Block Data Transfer Instructions

| Instruction | Size | Function |
| :---: | :---: | :---: |
| EEPMOV.B | - | if $\mathrm{R} 4 \mathrm{~L} \neq 0$ then |
|  |  | Repeat @ER5+ $\rightarrow$ @ER6+ $\mathrm{R} 4 \mathrm{~L}-1 \rightarrow \mathrm{R} 4 \mathrm{~L}$ |
|  |  | Until R4L $=0$ |
|  |  | else next; |
| EEPMOV.W | - | if $\mathrm{R} 4 \neq 0$ then |
|  |  | Repeat @ER5+ $\rightarrow$ @ER6+ $\mathrm{R} 4-1 \rightarrow \mathrm{R} 4$ |
|  |  | $\text { Until R4 }=0$ |
|  |  | else next; |
|  |  | Transfer a data block. Starting from the address set in ER5, transfers data for the number of bytes set in R4L or R4 to the address location set in ER6. |
|  |  | Execution of the next instruction begins as soon as the transfer is completed. |

### 2.6.4 Basic Instruction Formats

The H8S/2245 Group instructions consist of 2-byte (1-word) units. An instruction consists of an operation field (op field), a register field (r field), an effective address extension (EA field), and a condition field (cc).

Figure 2.12 shows examples of instruction formats.
(1) Operation field only
$\square$ NOP, RTS, etc.
(2) Operation field and register fields

| op | rn | rm |
| :---: | :---: | :---: |
| ADD.B Rn, Rm, etc. |  |  |

(3) Operation field, register fields, and effective address extension

| op | rn | rm |
| :---: | :---: | :---: |
| EA (disp) |  |  |

(4) Operation field, effective address extension, and condition field

| op | cc | EA (disp) |
| :---: | :---: | :---: |
| BRA d:16, etc |  |  |

Figure 2.12 Instruction Formats (Examples)
(1) Operation Field: Indicates the function of the instruction, the addressing mode, and the operation to be carried out on the operand. The operation field always includes the first four bits of the instruction. Some instructions have two operation fields.
(2) Register Field: Specifies a general register. Address registers are specified by 3 bits, data registers by 3 bits or 4 bits. Some instructions have two register fields. Some have no register field.
(3) Effective Address Extension: Eight, 16, or 32 bits specifying immediate data, an absolute address, or a displacement.
(4) Condition Field: Specifies the branching condition of Bcc instructions.

### 2.6.5 Notes on Use of Bit Manipulation Instructions

The BSET, BCLR, BNOT, BST, and BIST instructions read a byte of data, modify a bit in the byte, then write the byte back. Care is required when these instructions are used to access registers with write-only bits, or to access ports.

The BCLR instruction can be used to clear flags in the on-chip registers. In an interrupt-handling routine, for example, if it is known that the flag is set to 1 , it is not necessary to read the flag ahead of time. See section 2.10.3, Bit Manipulation Instructions, for details.

### 2.7 Addressing Modes and Effective Address Calculation

### 2.7.1 Addressing Modes

The CPU supports the eight addressing modes listed in table 2.11. Each instruction uses a subset of these addressing modes. Arithmetic and logic instructions can use the register direct and immediate modes. Data transfer instructions can use all addressing modes except program-counter relative and memory indirect. Bit manipulation instructions use register direct, register indirect, or absolute addressing mode to specify an operand, and register direct (BSET, BCLR, BNOT, and BTST instructions) or immediate (3-bit) addressing mode to specify a bit number in the operand.

Table 2.11 Addressing Modes

| No. | Addressing Mode | Symbol |
| :--- | :--- | :--- |
| 1 | Register direct | Rn |
| 2 | Register indirect | @ERn |
| 3 | Register indirect with displacement | @(d:16,ERn)/@(d:32,ERn) |
| 4 | Register indirect with post-increment | @ERn+ |
|  | Register indirect with pre-decrement | @-ERn |
| 5 | Absolute address | @aa:8/@aa:16/@aa:24/@aa:32 |
| 6 | Immediate | \#xx:8/\#xx:16/\#xx:32 |
| 7 | Program-counter relative | @(d:8,PC)/@(d:16,PC) |
| 8 | Memory indirect | @@aa:8 |

## (1) Register Direct-Rn

The register field of the instruction specifies an 8-, 16-, or 32-bit general register containing the operand. R0H to R7H and R0L to R7L can be specified as 8-bit registers. R0 to R7 and E0 to E7 can be specified as 16 -bit registers. ER0 to ER7 can be specified as 32-bit registers.
(2) Register Indirect—@ERn

The register field of the instruction code specifies an address register (ERn) which contains the address of the operand on memory. If the address is a program instruction address, the lower 24 bits are valid and the upper 8 bits are all assumed to be $0\left(\mathrm{H}^{\prime} 00\right)$.

## (3) Register Indirect with Displacement—@(d:16, ERn) or @(d:32, ERn)

A 16-bit or 32-bit displacement contained in the instruction is added to an address register (ERn) specified by the register field of the instruction, and the sum gives the address of a memory operand. A 16-bit displacement is sign-extended when added.
(4) Register Indirect with Post-Increment or Pre-Decrement—@ERn+ or @-ERn

- Register indirect with post-increment-@ERn+

The register field of the instruction code specifies an address register (ERn) which contains the address of a memory operand. After the operand is accessed, 1,2 , or 4 is added to the address register contents and the sum is stored in the address register. The value added is 1 for byte access, 2 for word transfer instruction, or 4 for longword transfer instruction. For word or longword transfer instruction, the register value should be even.

- Register indirect with pre-decrement-@-ERn

The value 1,2 , or 4 is subtracted from an address register (ERn) specified by the register field in the instruction code, and the result becomes the address of a memory operand. The result is also stored in the address register. The value subtracted is 1 for byte access, 2 for word transfer instruction, or 4 for longword transfer instruction. For word or longword transfer instruction, the register value should be even.
(5) Absolute Address—@aa:8, @aa:16, @aa:24, or @aa:32

The instruction code contains the absolute address of a memory operand. The absolute address may be 8 bits long ( $@ a a: 8$ ), 16 bits long (@aa:16), 24 bits long ( $@ a a: 24$ ), or 32 bits long (@aa:32).

To access data, the absolute address should be 8 bits (@aa:8), 16 bits (@aa:16), or 32 bits ( $@$ aa:32) long. For an 8 -bit absolute address, the upper 24 bits are all assumed to be 1
(H'FFFFFF). For a 16-bit absolute address the upper 16 bits are a sign extension. A 32-bit absolute address can access the entire address space.

A 24-bit absolute address (@aa:24) indicates the address of a program instruction. The upper 8 bits are all assumed to be $0\left(\mathrm{H}^{\prime} 00\right)$.

Table 2.12 indicates the accessible absolute address ranges.

Table 2.12 Absolute Address Access Ranges

| Absolute Address |  | Normal Mode | Advanced Mode |
| :--- | :--- | :--- | :--- |
| Data address | 8 bits (@aa:8) | H'FF00 to H'FFFF $^{16 \text { bits (@aa:16) }}$ | H' $^{\prime} 0000$ to H'FFFFF |
|  |  |  | H' $^{\prime} 000000$ to H'007FFF, |
|  | 32 bits (@aa:32) |  | H'FF8000 to H'FFFFFF $^{\text {H'000000 to H'FFFFFFF }}$ |
| Program instruction <br> address | 24 bits (@aa:24) |  |  |

## (6) Immediate—\#xx:8, \#xx:16, or \#xx:32

The instruction contains 8-bit (\#xx:8), 16-bit (\#xx:16), or 32-bit (\#xx:32) immediate data as an operand.

The ADDS, SUBS, INC, and DEC instructions contain immediate data implicitly. Some bit manipulation instructions contain 3-bit immediate data in the instruction code, specifying a bit number. The TRAPA instruction contains 2-bit immediate data in its instruction code, specifying a vector address.

## (7) Program-Counter Relative—@(d:8, PC) or @(d:16, PC)

This mode is used in the Bcc and BSR instructions. An 8-bit or 16-bit displacement contained in the instruction is sign-extended and added to the 24 -bit PC contents to generate a branch address. Only the lower 24 bits of this branch address are valid; the upper 8 bits are all assumed to be 0 ( $\mathrm{H}^{\prime} 00$ ). The PC value to which the displacement is added is the address of the first byte of the next instruction, so the possible branching range is -126 to +128 bytes ( -63 to +64 words) or -32766 to +32768 bytes ( -16383 to +16384 words) from the branch instruction. The resulting value should be an even number.

## (8) Memory Indirect—@ @aa:8

This mode can be used by the JMP and JSR instructions. The instruction code contains an 8 -bit absolute address specifying a memory operand. This memory operand contains a branch address. The upper bits of the absolute address are all assumed to be 0 , so the address range is 0 to 255 ( $\mathrm{H}^{\prime} 0000$ to $\mathrm{H}^{\prime} 00 \mathrm{FF}$ in normal mode, $\mathrm{H}^{\prime} 000000$ to $\mathrm{H}^{\prime} 0000 \mathrm{FF}$ in advanced mode). In normal mode the memory operand is a word operand and the branch address is 16 bits long. In advanced mode the memory operand is a longword operand, the first byte of which is assumed to be all $0\left(\mathrm{H}^{\prime} 00\right)$.

Note that the first part of the address range is also the exception vector area. For further details, refer to section 4, Exception Handling.

Figure 2.13 Branch Address Specification in Memory Indirect Mode
If an odd address is specified in word or longword memory access, or as a branch address, the least significant bit is regarded as 0 , causing data to be accessed or instruction code to be fetched at the address preceding the specified address. (For further information, see section 2.5.2, Memory Data Formats.)

### 2.7.2 Effective Address Calculation

Table 2.13 indicates how effective addresses are calculated in each addressing mode. In normal mode the upper 8 bits of the effective address are ignored in order to generate a 16-bit address.

Table 2.13 Effective Address Calculation

### 2.8 Processing States

### 2.8.1 Overview

The CPU has five main processing states: the reset state, exception handling state, program execution state, bus-released state, and power-down state. Figure 2.14 shows a diagram of the processing states. Figure 2.15 indicates the state transitions.

Note: * The power-down state also includes a medium-speed mode, module stop mode etc. See section 18, Power-Down Modes, for details.

Figure 2.14 Processing States

Notes: 1. From any state except hardware standby mode, a transition to the reset state occurs whenever $\overline{\operatorname{RES}}$ goes low. A transition can also be made to the reset state when the watchdog timer overflows.
2. From any state, a transition to hardware standby mode occurs when $\overline{\text { STBY }}$ goes low.

Figure 2.15 State Transitions

### 2.8.2 Reset State

When the $\overline{\mathrm{RES}}$ input goes low all current processing stops and the CPU enters the reset state. All interrupts are masked in the reset state. Reset exception handling starts when the $\overline{\operatorname{RES}}$ signal changes from low to high.

The reset state can also be entered by a watchdog timer overflow. For details, refer to section 11, Watchdog Timer.

### 2.8.3 Exception-Handling State

The exception-handling state is a transient state that occurs when the CPU alters the normal processing flow due to a reset, interrupt, or trap instruction. The CPU fetches a start address (vector) from the exception vector table and branches to that address.

## (1) Types of Exception Handling and Their Priority

Exception handling is performed for resets, interrupts, and trap instructions. Table 2.14 indicates the types of exception handling and their priority. Trap instruction exception handling is always accepted, in the program execution state.

Exception handling and the stack structure depend on the interrupt control mode set in SYSCR.
Table 2.14 Exception Handling Types and Priority

| Priority | Type of Exception | Detection Timing | Start of Exception Handling |
| :--- | :--- | :--- | :--- |
| High | Reset | Synchronized with clock | Exception handling starts <br> immediately after a low-to-high <br> transition at the $\overline{R E S}$ pin, or <br> when the watchdog timer <br> overflows. |
|  | Interrupt | End of instruction <br> execution or end of <br> exception-handling <br> sequence** | When an interrupt is requested, <br> exception handling starts at the <br> end of the current instruction or <br> current exception-handling <br> sequence |

Notes: 1. Interrupts are not detected at the end of the ANDC, ORC, XORC, and LDC instructions, or immediately after reset exception handling.
2. Trap instruction exception handling is always accepted, in the program execution state.

## (2) Reset Exception Handling

After the $\overline{\mathrm{RES}}$ pin has gone low and the reset state has been entered, when $\overline{\mathrm{RES}}$ goes high again, reset exception handling starts. When reset exception handling starts the CPU fetches a start address (vector) from the exception vector table and starts program execution from that address. All interrupts, including NMI, are disabled during reset exception handling and after it ends.

## (3) Interrupt Exception Handling and Trap Instruction Exception Handling

When interrupt or trap-instruction exception handling begins, the CPU references the stack pointer (ER7) and pushes the program counter and other control registers onto the stack. Next, the CPU alters the settings of the interrupt mask bits in the control registers. Then the CPU fetches a start address (vector) from the exception vector table and program execution starts from that start address.

Figure 2.16 shows the stack after exception handling ends.

Figure 2.16 Stack Structure after Exception Handling (Examples)

### 2.8.4 Program Execution State

In this state the CPU executes program instructions in sequence.

### 2.8.5 Bus-Released State

This is a state in which the bus has been released in response to a bus request from a bus master other than the CPU. While the bus is released, the CPU halts except for internal operations.

There is one bus masters other than the CPU - the data transfer controller (DTC).
For further details, refer to section 6, Bus Controller.

### 2.8.6 Power-Down State

The power-down state includes both modes in which the CPU stops operating and modes in which the CPU does not stop. There are three modes in which the CPU stops operating: sleep mode, software standby mode, and hardware standby mode. There are also two other power-down modes: medium-speed mode, and module stop mode. In medium-speed mode the CPU and other bus masters operate on a medium-speed clock. Module stop mode permits halting of the operation of individual modules, other than the CPU. For details, refer to section 18, Power-Down Modes.

Sleep Mode: A transition to sleep mode is made if the SLEEP instruction is executed while the software standby bit (SSBY) in the standby control register (SBYCR) is cleared to 0 . In sleep mode, CPU operations stop immediately after execution of the SLEEP instruction. The contents of CPU registers are retained.

Software Standby Mode: A transition to software standby mode is made if the SLEEP instruction is executed while the SSBY bit in SBYCR is set to 1 . In software standby mode, the CPU and clock halt and all MCU operations stop. As long as a specified voltage is supplied, the contents of CPU registers and on-chip RAM are retained. The I/O ports also remain in their existing states.

Hardware Standby Mode: A transition to hardware standby mode is made when the $\overline{\text { STBY }}$ pin goes low. In hardware standby mode, the CPU and clock halt and all MCU operations stop. The on-chip supporting modules are reset, but as long as a specified voltage is supplied, on-chip RAM contents are retained.

### 2.9 Basic Timing

### 2.9.1 Overview

The H8S/2000 CPU is driven by a system clock, denoted by the symbol $\phi$. The period from one rising edge of $\phi$ to the next is referred to as a "state." The memory cycle or bus cycle consists of one, two, or three states. Different methods are used to access on-chip memory, on-chip supporting modules, and the external address space.

### 2.9.2 On-Chip Memory (ROM, RAM)

On-chip memory is accessed in one state. The data bus is 16 bits wide, permitting both byte and word transfer instruction. Figure 2.17 shows the on-chip memory access cycle. Figure 2.18 shows the pin states.

Figure 2.17 On-Chip Memory Access Cycle

Figure 2.18 Pin States during On-Chip Memory Access

### 2.9.3 On-Chip Supporting Module Access Timing

The on-chip supporting modules are accessed in two states. The data bus is either 8 bits or 16 bits wide, depending on the particular internal I/O register being accessed. Figure 2.19 shows the access timing for the on-chip supporting modules. Figure 2.20 shows the pin states.

Figure 2.19 On-Chip Supporting Module Access Cycle

Figure 2.20 Pin States during On-Chip Supporting Module Access

### 2.9.4 External Address Space Access Timing

The external address space is accessed with an 8-bit or 16-bit data bus width in a two-state or three-state bus cycle. In three-state access, wait states can be inserted. For further details, refer to section 6, Bus Controller.

### 2.10 Usage Notes

### 2.10.1 TAS Instruction

Only register ER0, ER1, ER4, or ER5 should be used when using the TAS instruction. The TAS instruction is not generated by the Renesas Technology H8S and H8/300 Series C/C++ compilers. If the TAS instruction is used as a user-defined intrinsic function, ensure that only register ER0, ER1, ER4, or ER5 is used.

### 2.10.2 STM/LDM Instruction

With the STM or LDM instruction, the ER7 register is used as the stack pointer, and thus cannot be used as a register that allows save (STM) or restore (LDM) operation.

With a single STM or LDM instruction, two to four registers can be saved or restored. The available registers are as follows:

For two registers: ER0 and ER1, ER2 and ER3, or ER4 and ER5
For three registers: ER0 to ER2, or ER4 to ER6
For four registers: ER0 to ER3
For the Renesas Technology H8S or H8/300 Series C/C++ Compiler, the STM/LDM instruction including ER7 is not created.

### 2.10.3 Bit Manipulation Instructions

When a register that includes write-only bits is manipulated by a bit manipulation instruction, there are cases where the bits manipulated are not manipulated correctly or bits unrelated to the bits manipulated are changed.

When a register containing write-only bits is read, the value read is either a fixed value or an undefined value. This means that the bit manipulation instructions that use the value of bits read in their operation (BNOT, BTST, BAND, BIAND, BOR, BIOR, BXOR, BIXOR, BLD, and BILD) will not perform correct bit operations.

Also, bit manipulation instructions that perform a write operation on the data read after the calculation (BSET, BCLR, BNOT, BST, and BIST) may change bits unrelated to the bits manipulated. Thus extreme care is required when performing bit manipulation instructions on registers that include write-only bits.

The BSET, BCLR, BNOT, BST, and BIST instructions perform their operations in the following order.

1. Read the data in byte units
2. Perform the bit manipulation operation according to the instruction on the data read
3. Write the data back in byte units

Example: Using the BCLR instruction to clear only bit 4 in the port 1 P1DDR register.
The P1DDR register consists of 8 write-only bits and sets the I/O direction of the port 1 pins. Reading this register is invalid. When read, the values returned are undefined.

Here we present an example in which P14 is specified to be an input port using the BCLR instruction. Currently, P17 to P14 are set to be output pins and P13 to P10 are set to be input pins. At this point, the value of P1DDR is H'F0.

|  | P17 | P16 | P15 | P14 | P13 | P12 | P11 | P10 |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| I/O | Output | Output | Output | Output | Input | Input | Input | Input |
| P1DDR | 1 | 1 | 1 | 1 | 0 | 0 | 0 | 0 |

To switch P14 from the Output pin to the input pin function, the value of P1DDR bit 4 must be changed from 1 to 0 ( $H^{\prime} F 0 \rightarrow H^{\prime} E 0$ ). Here we assume that the BCLR instruction is used to clear P1DDR bit 4.

## BCLR \#4,@P1DDR

However if a bit manipulation instruction of the type shown above is used on P1DDR, which is a write-only register, the following problem may occur.

Although the first thing that happens is that data is read from P1DDR in byte units, the value read at this time is undefined. An undefined value is a value that is either 0 or 1 in the register but reads out as an arbitrary value whose relationship to the actual value is unknown. Since the P1DDR bits are all write-only bits, every bit reads out as an undefined value. Although the actual value of P1DDR at this point is H'F0, assume that bit 3 becomes a 1 here, and the value read out is H'F8.

|  | P17 | P16 | P15 | P14 | P13 | P12 | P11 | P10 |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| I/O | Output | Output | Output | Output | Input | Input | Input | Input |
| P1DDR | 1 | 1 | 1 | 1 | 0 | 0 | 0 | 0 |
| Read value | 1 | 1 | 1 | 1 | 1 | 0 | 0 | 0 |

The bit manipulation operation is performed on this value that was read. In this example, bit 4 will be cleared for H'F8.

|  | P17 | P16 | P15 | P14 | P13 | P12 | P11 | P10 |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| I/O | Output | Output | Output | Output | Input | Input | Input | Input |
| P1DDR | 1 | 1 | 1 | 1 | 0 | 0 | 0 | 0 |
| After bit <br> manipulation | 1 | 1 | 1 | 0 | 1 | 0 | 0 | 0 |

After the bit manipulation operation, this data will be written to P1DDR, and the BCLR instruction completes.

|  | P17 | P16 | P15 | P14 | P13 | P12 | P11 | P10 |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| I/O | Output | Output | Output | Input | Output | Input | Input | Input |
| P1DDR | 1 | 1 | 1 | 0 | 1 | 0 | 0 | 0 |
| Write value | 1 | 1 | 1 | 0 | 1 | 0 | 0 | 0 |

Although the instruction was expected to write $\mathrm{H}^{\prime} \mathrm{E} 0$ back to P1DDR, it actually wrote $\mathrm{H}^{\prime} \mathrm{E} 8$, and P13, which was expected to be an input pin, is changed to function as an output pin. While this section described the case where P13 was read out as a 1, since the values read are undefined when P17 to P10 are read, when this bit manipulation instruction completes, bits that were 0 may be changed to 1 , and bits that were 1 may be changed to 0 . To avoid this sort of problem, see section 2.10.4, Access Methods for Registers with Write-Only Bits, for methods for modifying registers that include write-only bits.

Also note that it is possible to use the BCLR instruction to clear to 0 flags in internal I/O registers. In this case, if it is clear from the interrupt handler or other information that the corresponding flag is set to 1 , then there is no need to read the value of the corresponding flag in advance.

### 2.10.4 Access Methods for Registers with Write-Only Bits

Undefined values will be read out if a data transfer instruction is executed for a register that includes write-only bits, or if a bit manipulation instruction is executed for a register that includes write-only bits. To avoid reading undefined values, use methods such as those shown below to access registers that include write-only bits.

The basic method for writing to a register that includes write-only bits is to create a work area in internal RAM or other memory area and first write the data to that area. Then, perform the desired access operation for that memory and finally write that data to the register that includes write-only bits.

Figure 2.21 Flowchart for Access Methods for Registers That Include Write-Only Bits
Example: To clear only bit 4 in the port 1 P1DDR
The P1DDR register consists of 8 write-only bits and sets the I/O direction of the port 1 pins. Reading this register is invalid. When read, the values returned are undefined.

Here we present an example in which P14 is specified to be an input port using the BCLR instruction. First, we write the initial value H'F0 written to P1DDR to the work area in RAM (RAM0).

MOV.B \#H'F0, R0L
MOV.B R0L, @PAM0
MOV.B R0L, @P1DDR

|  | P17 | P16 | P15 | P14 | P13 | P12 | P11 | P10 |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| I/O | Output | Output | Output | Output | Input | Input | Input | Input |
| P1DDR | 1 | 1 | 1 | 1 | 0 | 0 | 0 | 0 |

| RAM0 | 1 | 1 | 1 | 1 | 0 | 0 | 0 | 0 |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |

To switch P14 from being an output pin to being an input pin, we must change the value of P1DDR bit 4 from 1 to $0\left(\mathrm{H}^{\prime} \mathrm{F} 0 \rightarrow \mathrm{H}^{\prime} \mathrm{E} 0\right)$. Here, were execute a BCLR instruction for RAM0.

BCLR \#4, @RAM0

|  | P17 | P16 | P15 | P14 | P13 | P12 | P11 | P10 |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| I/O | Output | Output | Output | Output | Input | Input | Input | Input |
| P1DDR | 1 | 1 | 1 | 1 | 0 | 0 | 0 | 0 |

| RAM0 | 1 | 1 | 1 | 0 | 0 | 0 | 0 | 0 |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |

Since RAM0 can be read and written, when the bit manipulation instruction is executed, only bit 4 in RAM0 is cleared. Then we write this RAM0 value to P1DDR.

MOV.B @RAM0, R0L
MOV.B R0L, @P1DDR

|  | P17 | P16 | P15 | P14 | P13 | P12 | P11 | P10 |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| I/O | Output | Output | Output | Input | Input | Input | Input | Input |
| P1DDR | 1 | 1 | 1 | 0 | 0 | 0 | 0 | 0 |
| RAM0 | 1 | 1 | 1 | 0 | 0 | 0 | 0 | 0 |

If this procedure is used to write registers that include write-only bits, programs can be written without depending on the type of the instructions used.

## Section 3 MCU Operating Modes

### 3.1 Overview

### 3.1.1 Operating Mode Selection

Except for the $\mathrm{H} 8 \mathrm{~S} / 2240$, all $\mathrm{H} 8 \mathrm{~S} / 2245$ Group products have seven operating modes (modes 1 to 7). The H8S/2240 has three operating modes (modes 1,4 , and 5). These modes enable selection of the CPU operating mode, enabling/disabling of on-chip ROM, and the initial bus width setting, by setting the mode pins $\left(\mathrm{MD}_{2}\right.$ to $\left.\mathrm{MD}_{0}\right)$.

Table 3.1 lists the MCU operating modes.
Table 3.1 MCU Operating Mode Selection

| MCU <br> Operating Mode | MD ${ }_{2}$ | MD ${ }_{1}$ | MD | CPU <br> Operating Mode | Description | On-chip ROM | External Data Bus |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  |  |  |  |  |  | Initial Width | Max. <br> Width |
| 0 | 0 | 0 | 0 | - | - | - | - | - |
| 1 |  |  | 1 | Normal | On-chip ROM disabled, expanded mode | Disabled | 8 bits | 16 bits |
| 2* |  | 1 | 0 |  | On-chip ROM enabled, expanded mode | Enabled | 8 bits | 16 bits |
| 3* |  |  | 1 |  | Single-chip mode |  | - | - |
| 4 | 1 | 0 | 0 | Advanced | On-chip ROM disabled, | Disabled | 16 bits | 16 bits |
| 5 |  |  | 1 |  | expanded mode |  | 8 bits | 16 bits |
| 6* |  | 1 | 0 |  | On-chip ROM enabled, expanded mode | Enabled | 8 bits | 16 bits |
| 7* |  |  | 1 |  | Single-chip mode |  | - | - |

Note: * Cannot be used in the H8S/2240.

The CPU's architecture allows for 4 Gbytes of address space, but the H8S/2245 Group actually accesses a maximum of 16 Mbytes.

Modes 1,2 , and 4 to 6 are externally expanded modes that allow access to external memory and peripheral devices.

The external expansion modes allow switching between 8 -bit and 16-bit bus modes. After program execution starts, an 8-bit or 16-bit address space can be set for each area, depending on the bus controller setting. If 16 -bit access is selected for any one area, 16 -bit bus mode is set; if 8 -bit access is selected for all areas, 8 -bit bus mode is set.

Note that the functions of each pin depend on the operating mode.
The H8S/2245 Group can be used only in modes 1 to 7 . This means that the mode pins must be set to select one of these modes. Do not change the inputs at the mode pins during operation.

### 3.1.2 Register Configuration

The H8S/2245 Group has a mode control register (MDCR) that indicates the inputs at the mode pins $\left(\mathrm{MD}_{2}\right.$ to $\left.\mathrm{MD}_{0}\right)$, and a system control register (SYSCR) that controls the operation of the H8S/2245 Group. Table 3.2 summarizes these registers.

Table 3.2 Register Configuration

| Name | Abbreviation | R/W | Initial Value | Address* |
| :--- | :--- | :--- | :--- | :--- |
| Mode control register | MDCR | R | Undetermined | H'FF3B |
| System control register | SYSCR | R/W | H'01 | H'FF39 |

Note: * Lower 16 bits of the address.

### 3.2 Register Descriptions

### 3.2.1 Mode Control Register (MDCR)

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | - | - | MDS2 | MDS1 | MDS0 |
| Initial value: | 1 | 0 | 0 | 0 | 0 | —* | —* | —* |
| R/W | - | - | - | - | - | R | R | R |

Note: * Determined by pins $\mathrm{MD}_{2}$ to $\mathrm{MD}_{0}$.

MDCR is an 8-bit read-only register that indicates the current operating mode of the H8S/2245 Group.

Bit 7—Reserved: Read-only bit, always read as 1.
Bits 6 to 3—Reserved: Read-only bits, always read as 0 .
Bits 2 to 0—Mode Select 2 to 0 (MDS2 to MDSO): These bits indicate the input levels at pins $\mathrm{MD}_{2}$ to $\mathrm{MD}_{0}$ (the current operating mode). Bits MDS2 to MDS0 correspond to $\mathrm{MD}_{2}$ to $\mathrm{MD}_{0}$. MDS2 to MDS0 are read-only bits-they cannot be written to. The mode pin ( $\mathrm{MD}_{2}$ to $\mathrm{MD}_{0}$ ) input levels are latched into these bits when MDCR is read. These latches are canceled by a power-on reset, but are retained after a manual reset.

### 3.2.2 System Control Register (SYSCR)

| Bit | $:$ |
| :--- | :---: |
| 7 | 7 |

SYSCR is an 8-bit readable/writable register that selects the interrupt control mode, the detected edge for NMI, and enable or disable the on-chip RAM.

SYSCR is initialized to $\mathrm{H}^{\prime} 01$ by a reset and in hardware standby mode. It is not initialized in software standby mode.

Bit 7—Reserved: This bit can be read or written, but does not affect operation.

Bit 6—Reserved: Read-only bit, always read as 0.
Bits 5 and 4-Interrupt Control Mode 1 and 0 (INTM1, INTM0): These bits select the control mode of the interrupt controller. For details of the interrupt control modes, see section 5.4.1, Interrupt Control Modes and Interrupt Operation.

| Bit 5 | Bit 4 | Interrupt <br> Control Mode | Description |  |
| :--- | :--- | :--- | :--- | :--- |
| INTM1 | INTM0 | Control of interrupts by I bit | (Initial value) |  |
| 0 | 0 | 0 | Control of interrupts by I bit, U bit, and ICR |  |
|  | 1 | 1 | Setting prohibited |  |
| 1 | 0 | - | Setting prohibited |  |

Bit 3-NMI Edge Select (NMIEG): Selects the valid edge of the NMI interrupt input.
Bit 3

| NMIEG | Description |  |
| :--- | :--- | :--- |
| 0 | An interrupt is requested at the falling edge of NMI input | (Initial value) |
| 1 | An interrupt is requested at the rising edge of NMI input |  |

Bits 2 and 1—Reserved: Read-only bits, always read as 0 .
Bit 0-RAM Enable (RAME): Enables or disables the on-chip RAM. The RAME bit is initialized when the reset status is released. It is not initialized in software standby mode.

Bit 0
RAME Description

| 0 | On-chip RAM is disabled |  |
| :--- | :--- | :--- |
| 1 | On-chip RAM is enabled | (Initial value) |

Note: When the DTC is used, the RAME bit should not be cleared to 0 .

### 3.3 Operating Mode Descriptions

### 3.3.1 Mode 1

The CPU can access a 64-kbyte address space in normal mode. The on-chip ROM is disabled, and 8 -bit bus mode is set, immediately after a reset.

Ports B and C function as an address bus, port D functions as a data bus, and part of port F carries bus control signals. However, note that if 16-bit access is designated by the bus controller, the bus mode switches to 16 bits and port E becomes a data bus.

### 3.3.2 Mode 2

The CPU can access a 64-kbyte address space in normal mode. The on-chip ROM is enabled, and 8 -bit bus mode is set immediately after a reset.

Ports B and C function as input ports immediately after a reset. They can each be set to output addresses by setting the corresponding bits in the data direction register (DDR) to 1 . Port D functions as a data bus, and part of port $F$ carries bus control signals. However, note that if 16-bit access is designated by the bus controller, the bus mode switches to 16 bits and port E becomes a data bus.

The amount of on-chip ROM that can be used on the H8S/2246, H8S/2245, H8S/2244, and H8S/2243 is limited to 56 kbytes.

Note: Mode 2 cannot be used in the H8S/2240.

### 3.3.3 Mode 3

The CPU can access a 64-kbyte address space in normal mode. The on-chip ROM is enabled, but external addresses cannot be accessed.

All I/O ports are available for use as input-output ports.
The amount of on-chip ROM that can be used on the H8S/2246, H8S/2245, H8S/2244, and H8S/2243 is limited to 56 kbytes.

Note: Mode 3 cannot be used in the H8S/2240.

### 3.3.4 Mode 4

The CPU can access a 16-Mbyte address space in advanced mode. The on-chip ROM is disabled.
Pins $\mathrm{P}_{3}$ to $\mathrm{P}_{0}$, and ports $\mathrm{A}, \mathrm{B}$, and C function as an address bus, ports D and E function as a data bus, and part of port F carries bus control signals. $\mathrm{Pins} \mathrm{P}_{3}$ to $\mathrm{P} 1_{0}$ function as input ports immediately after a reset. They can each be set to output address use by setting the corresponding bits in the data direction register (DDR) to 1 .

The initial bus mode after a reset is 16 bits, with 16 -bit access to all areas. However, note that if 8bit access is designated by the bus controller for all areas, the bus mode switches to 8 bits.

### 3.3.5 Mode 5

The CPU can access a 16-Mbyte address space in advanced mode. The on-chip ROM is disabled.

Pins $\mathrm{P}_{3}$ to $\mathrm{P}_{0}$, and ports $\mathrm{A}, \mathrm{B}$, and C function as an address bus, ports D functions as a data bus, and part of port F carries bus control signals. $\mathrm{Pins} \mathrm{P}_{3}$ to $\mathrm{P}_{0}$ function as input ports immediately after a reset. They can each be set to output address use by setting the corresponding bits in the data direction register (DDR) to 1 .

The initial bus mode after a reset is 8 bits, with 8 -bit access to all areas. However, note that if at least one area is designated for 16-bit access by the bus controller, the bus mode switches to 16 bits and port E becomes a data bus.

### 3.3.6 Mode 6

The CPU can access a 16-Mbyte address space in advanced mode. The on-chip ROM is enabled.

Pins $\mathrm{P}_{3}$ to $\mathrm{P} 1_{0}$, and ports $\mathrm{A}, \mathrm{B}$, and C function as input ports immediately after a reset. They can each be set to output addresses by setting the corresponding bits in the data direction register (DDR) to 1. Port D functions as a data bus, and part of port F carries bus control signals.

The initial bus mode after a reset is 8 bits, with 8 -bit access to all areas. However, note that if at least one area is designated for 16-bit access by the bus controller, the bus mode switches to 16 bits and port E becomes a data bus.

Note: Mode 6 cannot be used in the H8S/2240.

### 3.3.7 Mode 7

The CPU can access a 16-Mbyte address space in advanced mode. The on-chip ROM is enabled, but external addresses cannot be accessed.

All I/O ports are available for use as input-output ports.
Note: Mode 7 cannot be used in the H8S/2240.

### 3.4 Pin Functions in Each Operating Mode

The pin functions of ports 1 , and A to F vary depending on the operating mode. Table 3.3 shows their functions in each operating mode.

Table 3.3 Pin Functions in Each Mode

| Port |  | Mode 1 | Mode 2* ${ }^{\text {² }}$ | Mode 3 | Mode 4 | Mode 5 | Mode 6*2 | Mode 7*2 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Port 1 | $\mathrm{P} 1_{3}$ to $\mathrm{P} 1_{0}$ | $\mathrm{P} *^{1 / T}$ | $\mathrm{P} * 1 / T$ | $\mathrm{P} * 1 / \mathrm{T}$ | $\mathrm{P} *^{1} / \mathrm{T} / \mathrm{A}$ | $\mathrm{P} *^{1} / \mathrm{T} / \mathrm{A}$ | $\mathrm{P} * 1 / \mathrm{T} / \mathrm{A}$ | $\mathrm{P} * 1 / \mathrm{T}$ |
| Port A | $\mathrm{PA}_{3}$ to $\mathrm{PA}_{0}$ | P | P | P | A | A | P*1/A | P |
| Port B |  | A | P*1/A | P | A | A | $\mathrm{P} * 1 / \mathrm{A}$ | P |
| Port C |  | A | P*1/A | P | A | A | P*1/A | P |
| Port D |  | D | D | P | D | D | D | P |
| Port E |  | P*1/D | P*1/D | P | P/D* ${ }^{1}$ | P*1/D | P*1/D | P |
| Port F | $\mathrm{PF}_{7}$ | P/C** | P/C* ${ }^{1}$ | P*1/C | P/C* ${ }^{1}$ | P/C* ${ }^{1}$ | P/C* ${ }^{1}$ | P*1/C |
|  | $\mathrm{PF}_{6}$ to $\mathrm{PF}_{3}$ | C | C | P | C | C | C | P |
|  | $\mathrm{PF}_{2}$ to $\mathrm{PF}_{0}$ | P*1/C | P*1/C |  | P*1/C | P*1/C | P*1/C |  |

Legend:
P: I/O port
T: Timer I/O
A: Address bus output
D: Data bus I/O
C: Control signals, clock I/O
Notes: 1. After reset
2. Cannot be used in the H8S/2240.

### 3.5 Memory Map in Each Operating Mode

The H8S/2246, H8S/2245, H8S/2244, H8S/2243, H8S/2242, H8S/2241, and H8S/2240 memory maps are shown in figures 3.1 to 3.7.

The address space is 64 kbytes in modes 1 to 3 (normal modes), and 16 Mbytes in modes 4 to 7 (advanced modes).

The on-chip ROM size is 128 kbytes in the H8S/2246 and H8S/2245, and 64 kbytes in the H8S/2244 and H8S/2243, but only 56 kbytes are available in modes 2 and 3 (normal modes).

The on-chip ROM size in the H8S/2242 and H8S/2241 is 32 kbytes.
The address space is divided into eight areas for modes 4 to 6 . For details, see section 6, Bus Controller.

## Section 4 Exception Handling

### 4.1 Overview

### 4.1.1 Exception Handling Types and Priority

As table 4.1 indicates, exception handling may be caused by a reset, trap instruction, or interrupt. Exception handling is prioritized as shown in table 4.1. If two or more exceptions occur simultaneously, they are accepted and processed in order of priority. Trap instruction exceptions are accepted at all times, in the program execution state. See appendix D.1, Port States in Each Mode.

Exception handling sources, the stack structure, and the operation of the CPU vary depending on the interrupt control mode set by the INTM0 and INTM1 bits of SYSCR.

Table 4.1 Exception Handling Types and Priority

| Priority | Exception Handling Type | Start of Exception Handling |
| :--- | :--- | :--- |
| High | Reset | Starts immediately after a low-to-high transition at <br> the RES pin, or when the watchdog timer overflows. |
|  | Interrupt | Starts when execution of the current instruction or <br> exception handling ends, if an interrupt request has <br> been issued*1 |
| Lrap instruction (TRAPA)** | Started by execution of a trap instruction (TRAPA) |  |

Notes: 1. Interrupt detection is not performed on completion of ANDC, ORC, XORC, or LDC instruction execution, or on completion of reset exception handling.
2. Trap instruction exception handling requests are accepted at all times in program execution state.

### 4.1.2 Exception Handling Operation

Exceptions originate from various sources. Trap instructions and interrupts are handled as follows:

1. The program counter ( PC ) and condition code register ( CCR ) are pushed onto the stack.
2. The interrupt mask bits are updated.
3. A vector address corresponding to the exception source is generated, and program execution starts from that address.

For a reset exception, steps 2 and 3 above are carried out.

### 4.1.3 Exception Sources and Vector Table

The exception sources are classified as shown in figure 4.1. Different vector addresses are assigned to different exception sources.

Table 4.2 lists the exception sources and their vector addresses.

| Exception <br> sources | $\left\{\begin{array}{l}\text { Reset } \\ \text { Interrupts } \\ \text { Manual reset }\end{array}\right.$ |
| :--- | :--- |
|  | $\left\{\begin{array}{l}\text { External interrupts: NMI, IRQ7 to IRQ0 } \\ \text { Internal interrupts: 34 interrupt sources in } \\ \text { on-chip supporting modules }\end{array}\right.$ |
| Trap instruction |  |

## Figure 4.1 Exception Sources

In modes 6 and 7, the on-chip ROM available for use on the H8S/2246 and H8S/2245 after a power-on reset is the 64-kbyte area comprising addresses H'000000 to H'00FFFF. Care is required when setting vector addresses. In this case, clearing the EAE bit in BCRL enables the 128-kbyte area comprising addresses $\mathrm{H}^{\prime} 000000$ to $\mathrm{H}^{\prime} 01 \mathrm{FFFF}$ to be used for the on-chip ROM.

Table 4.2 Exception Vector Table

| Exception Source | Vector Number | Vector Address** |  |
| :---: | :---: | :---: | :---: |
|  |  | Normal Mode | Advanced Mode |
| Power-on reset | 0 | $\mathrm{H}^{\prime} 0000$ to $\mathrm{H}^{\prime} 0001$ | H'0000 to H'0003 |
| Manual reset | 1 | $\mathrm{H}^{\prime} 0002$ to $\mathrm{H}^{\prime} 0003$ | H'0004 to H'0007 |
| Reserved for system use | 2 | $\mathrm{H}^{\prime} 0004$ to $\mathrm{H}^{\prime} 0006$ | H'0008 to H'000B |
|  | 3 | $\mathrm{H}^{\prime} 0006$ to $\mathrm{H}^{\prime} 0007$ | $\mathrm{H}^{\prime} 000 \mathrm{C}$ to $\mathrm{H}^{\prime} 000 \mathrm{~F}$ |

Notes: 1. Lower 16 bits of the address.
2. For details of internal interrupt vectors, see section 5.3.3, Interrupt Exception Handling Vector Table.

### 4.2 Reset

### 4.2.1 Overview

A reset has the highest exception priority.
When the $\overline{\text { RES }}$ pin goes low, all processing halts and the H8S/2245 Group enters the reset state. A reset initializes the internal state of the CPU and the registers of on-chip supporting modules. Immediately after a reset, interrupt control mode 0 is set.

Reset exception handling begins when the $\overline{\mathrm{RES}}$ pin changes from low to high.
The level of the NMI pin at reset determines whether the type of reset is a power-on reset or a manual reset.

The H8S/2245 Group can also be reset by overflow of the watchdog timer. For details see section 11, Watchdog Timer.

### 4.2.2 Reset Types

A reset can be of either of two types: a power-on reset or a manual reset. Reset types are shown in table 4.3.

The internal state of the CPU is initialized by either type of reset. A power-on reset also initializes all the registers in the on-chip peripheral modules, while a manual reset initializes all the registers in the on-chip supporting modules except for the bus controller and I/O ports, which retain their previous states.

With a manual reset, since the on-chip supporting modules are initialized, ports used as on-chip supporting module I/O pins are switched to I/O ports controlled by DDR and DR.

## Table 4.3 Reset Types

|  | Reset Transition <br> Conditions |  |  | Internal State |  |
| :--- | :--- | :--- | :--- | :--- | :--- |
| Type | NMI | $\overline{\text { RES }}$ |  | CPU | On-Chip Supporting Modules |
| Power-on reset | High | Low | Initialized | Initialized |  |
| Manual reset | Low | Low | Initialized | Initialized, except for bus controller <br> and I/O ports |  |

A reset caused by the watchdog timer can also be of either of two types: a power-on reset or a manual reset.

### 4.2.3 Reset Sequence

The H8S/2245 Group enters the reset state when the $\overline{\mathrm{RES}}$ pin goes low.
To ensure that the H8S/2245 Group is reset, hold the $\overline{\mathrm{RES}}$ pin low for at least 20 ms at power-up. To reset the H8S/2245 Group during operation, hold the $\overline{\mathrm{RES}}$ pin low for at least 20 states. See appendix D.1, Port States in Each Mode.

When the $\overline{\mathrm{RES}}$ pin goes high after being held low for the necessary time, the H8S/2245 Group starts reset exception handling as follows:

1. The internal state of the CPU and the registers of the on-chip supporting modules are initialized, and the I bit is set to 1 in CCR.
2. The reset exception handling vector address is read and transferred to the PC, and program execution starts from the address indicated by the PC.

Figures 4.2 and 4.3 show examples of the reset sequence.

(1) Reset exception handling vector address ((1) $=\mathrm{H}^{\prime} 0000$ )
(2) Start address (contents of reset exception handling vector address)
(3) Start address ((3) = (2))
(4) First program instruction

Figure 4.2 Reset Sequence (Modes 2 and 3)

(1) (3) Reset exception handling vector address ((1) $=\mathrm{H}^{\prime} 000000$, (3) $=\mathrm{H}^{\prime} 000002$ )
(2) (4) Start address (contents of reset exception handling vector address)
(5) $\quad$ Start address $((5)=(2)(4))$
(6) First program instruction

Note: * 3 program wait states are inserted.

## Figure 4.3 Reset Sequence (Mode 4)

### 4.2.4 Interrupts after Reset

If an interrupt is accepted after a reset but before the stack pointer (SP) is initialized, the PC and CCR will not be saved correctly, leading to a program crash. To prevent this, all interrupt requests, including NMI, are disabled immediately after a reset. Since the first instruction of a program is always executed immediately after the reset state ends, make sure that this instruction initializes the stack pointer (example: MOV.L \#xx: 32, SP).

### 4.2.5 State of On-Chip Supporting Modules after Reset Release

After reset release, MSTPCR is initialized to $\mathrm{H}^{\prime} 3$ FFF and all modules except the DTC enter module stop mode. Consequently, on-chip supporting module registers cannot be read or written to. Register reading and writing is enabled when module stop mode is exited.

### 4.3 Interrupts

Interrupt exception handling can be requested by nine external sources (NMI, IRQ7 to IRQ0) and 34 internal sources in the on-chip supporting modules. Figure 4.4 classifies the interrupt sources and the number of interrupts of each type.

The on-chip supporting modules that can request interrupts include the watchdog timer (WDT), 16-bit timer-pulse unit (TPU), 8-bit timer, serial communication interface (SCI), data transfer controller (DTC), and A/D converter. Each interrupt source has a separate vector address.

NMI is the highest-priority interrupt. Interrupts are controlled by the interrupt controller. The interrupt controller has two interrupt control modes and can assign interrupts other than NMI to three priority/mask levels to enable multiplexed interrupt control.

For details of interrupts, see section 5, Interrupt Controller.

Notes: Numbers in parentheses are the numbers of interrupt sources.

* When the watchdog timer is used as an interval timer, it generates an interrupt request at each counter overflow.

Figure 4.4 Interrupt Sources and Number of Interrupts

### 4.4 Trap Instruction

Trap instruction exception handling starts when a TRAPA instruction is executed. Trap instruction exception handling can be executed at all times in the program execution state.

The TRAPA instruction fetches a start address from a vector table entry corresponding to a vector number from 0 to 3 , as specified in the instruction code.

Table 4.4 shows the status of CCR after execution of trap instruction exception handling.
Table 4.4 Status of CCR after Trap Instruction Exception Handling

|  | CCR |  |
| :--- | :--- | :--- |
| Interrupt Control Mode | I | UI |
| 0 | 1 | - |
| 1 | 1 | 1 |

Legend:
1: Set to 1
-: Retains value prior to execution.

### 4.5 Stack Status after Exception Handling

Figure 4.5 shows the stack after completion of trap instruction exception handling and interrupt exception handling.

Note: * Ignored on return.
Figure 4.5 (1) Stack Status after Exception Handling (Normal Modes)

Figure 4.5 (2) Stack Status after Exception Handling (Advanced Modes)

### 4.6 Notes on Use of the Stack

When accessing word data or longword data, the H8S/2245 Group assumes that the lowest address bit is 0 . The stack should always be accessed by word transfer instruction or longword transfer instruction, and the value of the stack pointer (SP, ER7) should always be kept even. Use the following instructions to save registers:

```
PUSH.W Rn (or MOV.W Rn, @-SP)
PUSH.L ERn (or MOV.L ERn, @-SP)
```

Use the following instructions to restore registers:

```
POP.W Rn (or MOV.W @SP+, Rn)
POP.L ERn (or MOV.L @SP+, ERn)
```

Setting SP to an odd value may lead to a malfunction. Figure 4.6 shows an example of what happens when the SP value is odd.

Figure 4.6 Operation when SP Value is Odd

## Section 5 Interrupt Controller

### 5.1 Overview

### 5.1.1 Features

The H8S/2245 Group controls interrupts by means of an interrupt controller. The interrupt controller has the following features:

- Two interrupt control modes
- Either of two interrupt control modes can be set by means of the INTM1 and INTM0 bits in the system control register (SYSCR).
- Priorities settable with ICR
- An interrupt control register (ICR) is provided for setting interrupt priorities. Three priority levels can be set for each module for all interrupts except NMI.
- Independent vector addresses
- All interrupt sources are assigned independent vector addresses, making it unnecessary for the source to be identified in the interrupt handling routine.
- Nine external interrupts
- NMI is the highest-priority interrupt, and is accepted at all times. Rising edge or falling edge can be selected for NMI.
- Falling edge, rising edge, or both edge detection, or level sensing, can be selected for IRQ7 to IRQ0.
- DTC control
- DTC activation is performed by means of interrupts.

### 5.1.2 Block Diagram

A block diagram of the interrupt controller is shown in figure 5.1.

Figure 5.1 Block Diagram of Interrupt Controller

### 5.1.3 Pin Configuration

Table 5.1 summarizes the pins of the interrupt controller.
Table 5.1 Interrupt Controller Pins

| Name | Symbol | I/O | Function |
| :--- | :--- | :--- | :--- |
| Nonmaskable interrupt | NMI | Input | Nonmaskable external interrupt; rising or <br> falling edge can be selected |
| External interrupt <br> requests 7 to 0 | $\overline{\text { IRQ7 to } \overline{\text { IRQ0 }}}$ | Input | Maskable external interrupts; rising, falling, or <br> both edges, or level sensing, can be selected |

### 5.1.4 Register Configuration

Table 5.2 summarizes the registers of the interrupt controller.
Table 5.2 Interrupt Controller Registers

| Name | Abbreviation | R/W | Initial Value | Address** |
| :---: | :---: | :---: | :---: | :---: |
| System control register | SYSCR | R/W | H'01 | H'FF39 |
| IRQ sense control register H | ISCRH | R/W | H'00 | H'FF2C |
| IRQ sense control register L | ISCRL | R/W | H'00 | H'FF2D |
| IRQ enable register | IER | R/W | H'00 | H'FF2E |
| IRQ status register | ISR | $\mathrm{R} /(\mathrm{W})^{*}{ }^{2}$ | H'00 | H'FF2F |
| Interrupt control register A | ICRA | R/W | H'00 | H'FEC0 |
| Interrupt control register B | ICRB | R/W | H'00 | H'FEC1 |
| Interrupt control register C | ICRC | R/W | H'00 | H'FEC2 |

Notes: 1. Lower 16 bits of the address.
2. Can only be written with 0 for flag clearing.

### 5.2 Register Descriptions

### 5.2.1 System Control Register (SYSCR)

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | INTM1 | INTM0 | NMIEG | - | - | RAME |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 |
| R/W | R/W | - | R/W | R/w | R/W | - | - | R/W |

SYSCR is an 8-bit readable/writable register that selects the interrupt control mode, and the detected edge for NMI.

Only bits 5 to 3 are described here; for details of the other bits, see section 3.2.2, System Control Register (SYSCR).

SYSCR is initialized to $\mathrm{H}^{\prime} 01$ by a reset and in hardware standby mode. It is not initialized in software standby mode.

Bits 5 and 4-Interrupt Control Mode 1 and $\mathbf{0}$ (INTM1, INTM0): These bits select one of two interrupt control modes for the interrupt controller.

| Bit 5 | Bit 4 | Interrupt <br> Control Mode | Description |  |
| :--- | :--- | :--- | :--- | :--- |
| INTM1 | INTM0 |  | Interrupts are controlled by I bit | (Initial value) |
| 0 | 0 | 0 | Interrupts are controlled by I and UI bits and ICR |  |
|  | 1 | 1 | Setting prohibited |  |
| 1 | 0 | - | Setting prohibited |  |

Bit 3-NMI Edge Select (NMIEG): Selects the input edge for the NMI pin.
Bit 3

| NMIEG | Description |  |
| :--- | :--- | :--- |
| 0 | Interrupt request generated at falling edge of NMI input | (Initial value) |
| 1 | Interrupt request generated at rising edge of NMI input |  |

### 5.2.2 Interrupt Control Registers A to C (ICRA to ICRC)

| Bit | $:$ | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | ICR7 | ICR6 | ICR5 | ICR4 | ICR3 | ICR2 | ICR1 | ICR0 |  |
|  | Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | $:$ | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

The ICR registers are three 8-bit readable/writable registers that set the interrupt control level for interrupts other than NMI.

The correspondence between ICR settings and interrupt sources is shown in table 5.3.

The ICR registers are initialized to $\mathrm{H}^{\prime} 00$ by a reset and in hardware standby mode.
Bit n—Interrupt Control Level (ICRn):
Bit n

| ICRn | Description |  |
| :--- | :--- | :--- | :--- |
| 0 | The corresponding interrupt requests have priority level 0 (low priority) | (Initial value) |
| 1 | The corresponding interrupt requests have priority level 1 (high priority) |  |
| Note: | $\mathrm{n}=7$ to 0 |  |

Table 5.3 Correspondence between Interrupt Sources and ICR Settings

|  | Bits |  |  |  |  |  |  |  |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| Register | $\mathbf{7}$ | $\mathbf{6}$ | $\mathbf{5}$ | $\mathbf{4}$ | $\mathbf{3}$ | $\mathbf{2}$ | $\mathbf{1}$ | $\mathbf{0}$ |
| ICRA | IRQ0 | IRQ1 | IRQ2 | IRQ4 | IRQ6 | DTC | $\begin{array}{l}\text { Watchdog }\end{array}$ | - |
|  |  |  | IRQ3 | IRQ5 | IRQ7 |  | timer |  |$]$

### 5.2.3 IRQ Enable Register (IER)

| Bit | $:$ | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | IRQ7E | IRQ6E | IRQ5E | IRQ4E | IRQ3E | IRQ2E | IRQ1E | IRQ0E |  |
|  | Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | $:$ | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

IER is an 8-bit readable/writable register that controls enabling and disabling of interrupt requests IRQ7 to IRQ0.

IER is initialized to $\mathrm{H}^{\prime} 00$ by a reset and in hardware standby mode.
Bits 7 to 0—IRQ7 to IRQ0 Enable (IRQ7E to IRQ0E): These bits select whether IRQ7 to IRQ0 are enabled or disabled.

Bit n
IRQnE Description

| 0 | IRQn interrupts disabled | (Initial value) |
| :--- | :--- | :--- |
| 1 | IRQn interrupts enabled |  |

Note: $\mathrm{n}=7$ to 0

### 5.2.4 IRQ Sense Control Registers H and L (ISCRH, ISCRL)

ISCRH

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | IRQ7SCB | IRQ7SCA | IRQ6SCB | IRQ6SCA | IRQ5SCB | IRQ5SCA | IRQ4SCB | IRQ4SCA |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

ISCRL

| Bit | $:$ | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | IRQ3SCB | IRQ3SCA | IRQ2SCB | IRQ2SCA | IRQ1SCB | IRQ1SCA | IRQ0SCB | IRQ0SCA |  |
|  | Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | $:$ | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

The ISCR registers are 16-bit readable/writable registers that select rising edge, falling edge, or both edge detection, or level sensing, for the input at pins $\overline{\mathrm{IRQ} 7}$ to $\overline{\mathrm{IRQ} 0}$.

The ISCR registers are initialized to $\mathrm{H}^{\prime} 0000$ by a reset and in hardware standby mode.

Bits 15 to 0: IRQ7 Sense Control A and B (IRQ7SCA, IRQ7SCB) to IRQ0 Sense Control A and B (IRQ0SCA, IRQ0SCB)

Bits 15 to 0

| IRQ7SCB to <br> IRQ0SCB | IRQ7SCA to <br> IRQ0SCA |  |
| :--- | :--- | :--- |
| 0 | 0 | Description |

### 5.2.5 IRQ Status Register (ISR)

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | IRQ7F | IRQ6F | IRQ5F | IRQ4F | IRQ3F | IRQ2F | IRQ1F | IRQ0F |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | $\mathrm{R} /(\mathrm{W})^{*}$ | $\mathrm{R} /(\mathrm{W})^{*}$ | $\mathrm{R} /(\mathrm{W})^{*}$ | $\mathrm{R} /(\mathrm{W})^{*}$ | $\mathrm{R} /(\mathrm{W})^{*}$ | $\mathrm{R} /(\mathrm{W})^{*}$ | $\mathrm{R} /(\mathrm{W})^{*}$ | $\mathrm{R} /(\mathrm{W})^{*}$ |

Note: * Only 0 can be written, to clear the flag.

ISR is an 8-bit readable/writable register that indicates the status of IRQ7 to IRQ0 interrupt requests.

ISR is initialized to $\mathrm{H}^{\prime} 00$ by a reset and in hardware standby mode.

Bits 7 to 0—IRQ7 to IRQ0 flags (IRQ7F to IRQ0F): These bits indicate the status of IRQ7 to IRQ0 interrupt requests.

## Bit n

## IRQnF Description

$0 \quad$ [Clearing conditions]

- Cleared by reading IRQnF flag when $I R Q n F=1$, then writing 0 to IRQnF flag
- When IRQn interrupt exception handling is executed when low-level detection is set $(\operatorname{IRQnSCB}=\mathrm{IRQnSCA}=0)$ and $\overline{\mathrm{IRQn}}$ input is high
- When IRQn interrupt exception handling is executed when falling, rising, or both-edge detection is set (IRQnSCB = 1 or IRQnSCA =1)
- When DTC is activated by IRQn interrupt while DISEL bit of MRB in DTC is 0 .

1 [Setting conditions]

- When $\overline{\mathrm{IRQn}}$ input goes low when low-level detection is set (IRQnSCB $=\operatorname{IRQnSCA}=$ 0)
- When a falling edge occurs in $\overline{\mathrm{IRQn}}$ input when falling edge detection is set (IRQnSCB $=0$, IRQnSCA $=1$ )
- When a rising edge occurs in $\overline{\mathrm{IRQn}}$ input when rising edge detection is set (IRQnSCB = 1, IRQnSCA = 0)
- When a falling or rising edge occurs in $\overline{\mathrm{IRQn}}$ input when both-edge detection is set $(\operatorname{IRQnSCB}=\mathrm{IRQnSCA}=1)$

[^1]
### 5.3 Interrupt Sources

Interrupt sources comprise external interrupts (NMI and IRQ7 to IRQ0) and internal interrupts (34 sources).

### 5.3.1 External Interrupts

There are nine external interrupts: NMI and IRQ7 to IRQ0. Of these, NMI and IRQ2 to IRQ0 can be used to restore the H8S/2245 Group from software standby mode.

NMI Interrupt: NMI is the highest-priority interrupt, and is always accepted by the CPU regardless of the status of the CPU interrupt mask bits. The NMIEG bit in SYSCR can be used to select whether an interrupt is requested at a rising edge or a falling edge on the NMI pin.

The vector number for NMI interrupt exception handling is 7 .
IRQ7 to IRQ0 Interrupts: Interrupts IRQ7 to IRQ0 are requested by an input signal at pins $\overline{\overline{R Q Q} 7}$ to $\overline{\mathrm{IRQ} 0}$. Interrupts IRQ7 to IRQ0 have the following features:

- Using ISCR, it is possible to select whether an interrupt is generated by a low level, falling edge, rising edge, or both edges, at pins $\overline{\text { IRQ7 }}$ to $\overline{\text { IRQ0 }}$.
- Enabling or disabling of interrupt requests IRQ7 to IRQ0 can be selected with IER.
- The interrupt control level can be set with ICR.
- The status of interrupt requests IRQ7 to IRQ0 is indicated in ISR. ISR flags can be cleared to 0 by software.

A block diagram of interrupts IRQ7 to IRQ0 is shown in figure 5.2.

Figure 5.2 Block Diagram of Interrupts IRQ7 to IRQ0
Figure 5.3 shows the timing of setting IRQnF.
$\phi$ $\square$

$\overline{\text { IRQn }}$ input pin

IRQnF $\square$
Note: $\mathrm{n}=7$ to 0

## Figure 5.3 Timing of Setting IRQnF

The vector numbers for IRQ7 to IRQ0 interrupt exception handling are 23 to 16.
Detection of IRQ7 to IRQ0 interrupts does not depend on whether the relevant pin has been set for input or output. However, when a pin is used as an external interrupt input pin, do not clear the corresponding DDR to 0 and use the pin as an I/O pin for another function. Interrupt request flags IRQ7 to IRQ0 are set when the setting condition is met, regardless of the IER setting, and therefore only the necessary flags should be checked.

### 5.3.2 Internal Interrupts

There are 34 sources for internal interrupts from on-chip supporting modules.

- For each on-chip supporting module there are flags that indicate the interrupt request status, and enable bits that select enabling or disabling of these interrupts. If any one of these is set to 1 , an interrupt request is issued to the interrupt controller.
- The interrupt control level can be set by means of ICR.
- The DTC can be activated by a TPU, 8 -bit timer, SCI, or other interrupt request. When the DTC is activated by an interrupt, it is not affected by the interrupt control mode and interrupt mask bits.

### 5.3.3 Interrupt Exception Handling Vector Table

Table 5.4 shows interrupt exception handling sources, vector addresses, and interrupt priorities. For default priorities, the lower the vector number, the higher the priority.

Priorities among modules can be set by means of the ICR. The situation when two or more modules are set to the same priority, and priorities within a module, are fixed as shown in table 5.4.

Table 5.4 Interrupt Sources, Vector Addresses, and Interrupt Priorities

| Interrupt Source | Origin of Interrupt Source | Vector Number | Vector Address* |  | ICR | Priority |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  |  | Normal Mode | Advanced Mode |  |  |
| NMI | External pin | 7 | H'000E | H'001C |  | High |
| IRQ0 |  | 16 | H'0020 | H'0040 | ICRA7 |  |
| IRQ1 |  | 17 | H'0022 | H'0044 | ICRA6 |  |
| IRQ2 |  | 18 | H'0024 | H'0048 | ICRA5 |  |
| IRQ3 |  | 19 | H'0026 | H'004C |  |  |
| IRQ4 |  | 20 | H'0028 | H'0050 | ICRA4 |  |
| IRQ5 |  | 21 | H'002A | H'0054 |  |  |
| IRQ6 |  | 22 | H'002C | H'0058 | ICRA3 |  |
| IRQ7 |  | 23 | H'002E | H'005C |  |  |
| SWDTEND (software activation interrupt end) | DTC | 24 | H'0030 | H'0060 | ICRA2 |  |
| WOVI (interval timer) | Watchdog timer | 25 | H'0032 | H'0064 | ICRA1 |  |
| Reserved | - | 26 | H'0034 | H'0068 | ICRAO |  |
|  | - | 27 | H'0036 | H'006C | ICRB7 |  |
| ADI (A/D conversion end) | A/D | 28 | H'0038 | H'0070 | ICRB6 |  |
| Reserved | - | 29 | H'003A | H'0074 |  |  |

### 5.4 Interrupt Operation

### 5.4.1 Interrupt Control Modes and Interrupt Operation

Interrupt operations in the H8S/2245 Group differ depending on the interrupt control mode.
NMI interrupts are accepted at all times except in the reset state and the hardware standby state. In the case of IRQ interrupts and on-chip supporting module interrupts, an enable bit is provided for each interrupt. Clearing an enable bit to 0 disables the corresponding interrupt request. Interrupt sources for which the enable bits are set to 1 are controlled by the interrupt controller.

Table 5.5 shows the interrupt control modes.
The interrupt controller performs interrupt control according to the interrupt control mode set by the INTM1 and INTM0 bits in SYSCR, the priorities set in ICR, and the masking state indicated by the I and UI bits in the CPU's CCR.

Table 5.5 Interrupt Control Modes

| Interrupt Control Mode | SYSCR |  | Priority Setting Registers | Interrupt Mask Bits | Description |
| :---: | :---: | :---: | :---: | :---: | :---: |
|  | INTM1 | INTM0 |  |  |  |
| 0 | 0 | 0 | ICR | I | Interrupt mask control is performed by the I bit. |
|  |  |  |  |  | Priority can be set with ICR. |
| 1 |  | 1 | ICR | I, UI | 3-level interrupt mask control is performed by the I and UI bits. |
|  |  |  |  |  | Priority can be set with ICR. |

Figure 5.4 shows a block diagram of the priority decision circuit.

Figure 5.4 Block Diagram of Interrupt Control Operation
(1) Interrupt Acceptance Control and 3-Level Control

Interrupt acceptance control and 3-level mask control is performed by means of the I and UI bits in CCR, and ICR (control level).

Table 5.6 shows the interrupts selected in each interrupt control mode.
Table 5.6 Interrupts Selected in Each Interrupt Control Mode

|  | Interrupt Mask Bits |  |  |
| :--- | :--- | :--- | :--- |
| Interrupt Control Mode | $\mathbf{I}$ | Ul | Selected Interrupts |
| 0 | 0 | $*$ | All interrupts (control level 1 has priority) |
|  | 1 | $*$ | NMI interrupts |
| 1 | 0 | $*$ | All interrupts (control level 1 has priority) |
|  | 1 | 0 | NMI and control level 1 interrupts |

## Legend:

*: Don't care

## (2) Default Priority Determination

When an interrupt is selected its priority is determined and a vector number is generated.

If the same value is set for ICR, acceptance of multiple interrupts is enabled, and so only the interrupt source with the highest priority according to the table 5.4 and has a vector number generated.

Interrupt sources with a lower priority than the accepted interrupt source are held pending.
Table 5.7 shows operations and control signal functions in each interrupt control mode.
Table 5.7 Operations and Control Signal Functions in Each Interrupt Control Mode

| Interrupt Control Mode | Setting |  | Interrupt Acceptance Control 3-Level Control |  |  |  | Default Priority Determination |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | INTM1 | INTM0 |  | I | UI | ICR |  |
| 0 | 0 | 0 | $\bigcirc$ | IM | - | PR | $\bigcirc$ |
| 1 |  | 1 | $\bigcirc$ | IM | IM | PR | $\bigcirc$ |

Legend:
O: Interrupt operation control performed
IM: Used as interrupt mask bit
PR: Sets priority.
-: Not used.

### 5.4.2 Interrupt Control Mode 0

Enabling and disabling of IRQ interrupts and on-chip supporting module interrupts can be set by means of the I bit in the CPU's CCR, and ICR. Interrupts are enabled when the I bit is cleared to 0 , and disabled when set to 1 . Control level 1 interrupt sources have higher priority.

Figure 5.5 shows a flowchart of the interrupt acceptance operation in this case.
[1] If an interrupt source occurs when the corresponding interrupt enable bit is set to 1 , an interrupt request is sent to the interrupt controller.
[2] When interrupt requests are sent to the interrupt controller, a control level 1 interrupt, according to the control level set in ICR, has priority for selection, and other interrupt requests are held pending. If a number of interrupt requests with the same control level setting are generated at the same time, the interrupt request with the highest priority according to the priority system shown in table 5.4 is selected.
[3] The I bit is then referenced. If the I bit is cleared to 0 , the interrupt request is accepted. If the I bit is set to 1 , only an NMI interrupt is accepted, and other interrupt requests are held pending.
[4] When an interrupt request is accepted, interrupt exception handling starts after execution of the current instruction has been completed.
[5] The PC and CCR are saved to the stack area by interrupt exception handling. The PC saved on the stack shows the address of the first instruction to be executed after returning from the interrupt handling routine.
[6] Next, the I bit in CCR is set to 1 . This masks all interrupts except NMI.
[7] A vector address is generated for the accepted interrupt, and execution of the interrupt handling routine starts at the address indicated by the contents of that vector address.

Figure 5.5 Flowchart of Procedure Up to Interrupt Acceptance in Interrupt Control Mode 0

### 5.4.3 Interrupt Control Mode 1

Three-level masking is implemented for IRQ interrupts and on-chip supporting module interrupts by means of the I and UI bits in the CPU's CCR, and ICR.

- Control level 0 interrupt requests are enabled when the I bit is cleared to 0 , and disabled when set to 1 .
- Control level 1 interrupt requests are enabled when the I bit or UI bit is cleared to 0 , and disabled when both the I bit and the UI bit are set to 1 .

For example, if the interrupt enable bit for an interrupt request is set to 1 , and $\mathrm{H}^{\prime} 20, \mathrm{H}^{\prime} 00$, and $\mathrm{H}^{\prime} 00$ are set in ICRA, ICRB, and ICRC, respectively, (i.e. IRQ2 and IRQ3 interrupts are set to control level 1 and other interrupts to control level 0 ), the situation is as follows:

- When $\mathrm{I}=0$, all interrupts are enabled
(Priority order: NMI > IRQ2 > IRQ3 > IRQ0 ...)
- When $\mathrm{I}=1$ and $\mathrm{UI}=0$, only NMI, IRQ2, and IRQ3 interrupts are enabled
- When $\mathrm{I}=1$ and $\mathrm{UI}=1$, only NMI interrupts are enabled

Figure 5.6 shows the state transitions in these cases.

Figure 5.6 Example of State Transitions in Interrupt Control Mode 1
Figure 5.7 shows a flowchart of the interrupt acceptance operation in this case.
[1] If an interrupt source occurs when the corresponding interrupt enable bit is set to 1 , an interrupt request is sent to the interrupt controller.
[2] When interrupt requests are sent to the interrupt controller, a control level 1 interrupt, according to the control level set in ICR, has priority for selection, and other interrupt requests are held pending. If a number of interrupt requests with the same control level setting are generated at the same time, the interrupt request with the highest priority according to the priority system shown in table 5.4 is selected.
[3] The I bit is then referenced. If the I bit is cleared to 0 , it is not affected by the UI bit. An interrupt request set to interrupt control level 0 is accepted when the I bit is cleared to 0 . If the I bit is set to 1 , only an NMI interrupt is accepted, and other interrupt requests are held pending.

An interrupt request set to interrupt control level 1 has priority over an interrupt request set to interrupt control level 0 , and is accepted if the I bit is cleared to 0 , or if the I bits is set to 1 and the UI bit is cleared to 0 .
When both the I bit and the UI bit are set to 1, only an NMI interrupt is accepted, and other interrupt requests are held pending.
[4] When an interrupt request is accepted, interrupt exception handling starts after execution of the current instruction has been completed.
[5] The PC and CCR are saved to the stack area by interrupt exception handling. The PC saved on the stack shows the address of the first instruction to be executed after returning from the interrupt handling routine.
[6] Next, the I and UI bits in CCR are set to 1 . This masks all interrupts except NMI.
[7] A vector address is generated for the accepted interrupt, and execution of the interrupt handling routine starts at the address indicated by the contents of that vector address.

Figure 5.7 Flowchart of Procedure Up to Interrupt Acceptance in Interrupt Control Mode 1

### 5.4.4 Interrupt Exception Handling Sequence

Figure 5.8 shows the interrupt exception handling sequence. The example shown is for the case where interrupt control mode 0 is set in advanced mode, and the program area and stack area are in on-chip memory.

Figure 5.8 Interrupt Exception Handling

### 5.4.5 Interrupt Response Times

The H8S/2245 Group is capable of fast word transfer instruction to on-chip memory, and the program area is provided in on-chip ROM and the stack area in on-chip RAM, enabling highspeed processing.

Table 5.8 shows interrupt response times - the interval between generation of an interrupt request and execution of the first instruction in the interrupt handling routine. The execution status symbols used in table 5.8 are explained in table 5.9.

## Table 5.8 Interrupt Response Times

|  | Normal Mode | Advanced Mode |
| :---: | :---: | :---: |
| No. Execution Status | INTM1 = 0 | INTM1 = 0 |
| 1 Interrupt priority determination* ${ }^{1}$ | 3 | 3 |
| 2 Number of wait states until executing instruction ends* ${ }^{2}$ | 1 to $19+2 \cdot S_{\text {, }}$ | 1 to $19+2 \cdot \mathrm{~S}$ |
| 3 PC, CCR stack save | $2 \cdot \mathrm{~S}_{\mathrm{K}}$ | $2 \cdot S_{\text {K }}$ |
| 4 Vector fetch | $\mathrm{S}_{1}$ | 2.S |
| 5 Instruction fetch* ${ }^{3}$ | 2.S | 2.S |
| 6 Internal processing* ${ }^{4}$ | 2 | 2 |
| Total (using on-chip memory) | 11 to 31 | 12 to 32 |

Notes: 1. Two states in case of internal interrupt.
2. Refers to MULXS and DIVXS instructions.
3. Prefetch after interrupt acceptance and interrupt handling routine prefetch.
4. Internal processing after interrupt acceptance and internal processing after vector fetch.

Table 5.9 Number of States in Interrupt Handling Routine Execution Statuses

## Object of Access

| Symbol |  | Internal Memory | External Device |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  |  | 8 Bit Bus |  | 16 Bit Bus |  |
|  |  |  | 2-State Access | 3-State Access | 2-State Access | 3-State Access |
| Instruction fetch | S | 1 | 4 | 6+2m | 2 | 3+m |
| Branch address read | S |  |  |  |  |  |
| Stack manipulation | $\mathrm{S}_{\mathrm{K}}$ |  |  |  |  |  |

## Legend:

m : Number of wait states in an external device access.

### 5.5 Usage Notes

### 5.5.1 Contention between Interrupt Generation and Disabling

When an interrupt enable bit is cleared to 0 to disable interrupt requests, the disabling becomes effective after execution of the instruction.

In other words, when an interrupt enable bit is cleared to 0 by an instruction such as BCLR or MOV, if an interrupt is generated during execution of the instruction, the interrupt concerned will still be enabled on completion of the instruction, and so interrupt exception handling for that interrupt will be executed on completion of the instruction. However, if there is an interrupt request of higher priority than that interrupt, interrupt exception handling will be executed for the higher-priority interrupt, and the lower-priority interrupt will be ignored.

The same also applies when an interrupt source flag is cleared.
Figure 5.9 shows and example in which the CMIEA bit in 8 -bit timer TCR is cleared to 0 .
The above contention will not occur if an enable bit or interrupt source flag is cleared to 0 while the interrupt is masked.

Figure 5.9 Contention between Interrupt Generation and Disabling

### 5.5.2 Instructions that Disable Interrupts

Instructions that disable interrupts are LDC, ANDC, ORC, and XORC. After any of these instructions is executed, all interrupts including NMI are disabled and the next instruction is always executed. When the I bit or UI bit is set by one of these instructions, the new value becomes valid two states after execution of the instruction ends.

### 5.5.3 Times when Interrupts Are Disabled

There are times when interrupt acceptance is disabled by the interrupt controller.
The interrupt controller disables interrupt acceptance for a 3-state period after the CPU has updated the mask level with an LDC, ANDC, ORC, or XORC instruction.

### 5.5.4 Interrupts during Execution of EEPMOV Instruction

Interrupt operation differs between the EEPMOV.B instruction and the EEPMOV.W instruction.
With the EEPMOV.B instruction, an interrupt request (including NMI) issued during the transfer is not accepted until the move is completed.

With the EEPMOV.W instruction, if an interrupt request is issued during the transfer, interrupt exception handling starts at a break in the transfer cycle. The PC value saved on the stack in this case is the address of the next instruction.

Therefore, if an interrupt is generated during execution of an EEPMOV.W instruction, the following coding should be used.

```
L1: EEPMOV.W
    MOV.W R4,R4
    BNE L1
```

### 5.5.5 IRQ Interrupt

When operating by clock input, acceptance of input to an IRQ is synchronized with the clock. In software standby mode, the input is accepted asynchronously. For details on the input conditions, see section 19.4.2, Control Signal Timing.

### 5.5.6 NMI Interrupt Usage Notes

The NMI interrupt is part of the exception processing performed cooperatively by the LSI's internal interrupt controller and the CPU when the system is operating normally under the specified electrical conditions. No operations, including NMI interrupts, are guaranteed when operation is not normal (runaway status) due to software problems or abnormal input to the LSI's pins. In such cases, the LSI may be restored to the normal program execution state by applying an external reset.

### 5.6 DTC Activation by Interrupt

### 5.6.1 Overview

The DTC can be activated by an interrupt. In this case, the following options are available:

- Interrupt request to CPU
- Activation request to DTC
- Selection of a number of the above

For details of interrupt requests that can be used with to activate the DTC, see section 7, Data Transfer Controller.

### 5.6.2 Block Diagram

Figure 5.10 shows a block diagram of the DTC and interrupt controller.

Figure 5.10 Interrupt Control for DTC

### 5.6.3 Operation

The interrupt controller has three main functions in DTC control.

## (1) Selection of Interrupt Source

Interrupt sources can be specified as DTC activation requests or CPU interrupt requests by means of the DTCE bit of DTCEA to DTCEF in the DTC.

After a DTC data transfer, the DTCE bit can be cleared to 0 and an interrupt request sent to the CPU in accordance with the specification of the DISEL bit of MRB in the DTC.

When the DTC has performed the specified number of data transfers and the transfer counter value is zero, the DTCE bit is cleared to 0 and an interrupt request is sent to the CPU after the DTC data transfer.

## (2) Determination of Priority

The DTC activation source is selected in accordance with the default priority order, and is not affected by mask or priority levels. See section 7.3.3, DTC Vector Table, for the respective priorities.

## (3) Operation Order

If the same interrupt is selected as a DTC activation source and a CPU interrupt source, the DTC data transfer is performed first, followed by CPU interrupt exception handling.

Table 5.10 summarizes interrupt source selection and interrupt source clearance control according to the settings of the DTCE bit of DTCEA to DTCEF in the DTC and the DISEL bit of MRB in the DTC.

Table 5.10 Interrupt Source Selection and Clearing Control

|  | Settings |  |  |  |
| :--- | :--- | :--- | :--- | :--- |
|  | DTC |  | Interrupt Source Selection/Clearing Control |  |
| DTCE | DISEL | DTC | CPU |  |
| 0 | $*$ | $X$ | $\triangle$ |  |
| 1 | 0 | $\triangle$ | $X$ |  |
|  | 1 |  |  | $\triangle$ |

## Legend:

$\triangle$ : The relevant interrupt is used. Interrupt source clearing is performed. (The CPU should clear the source flag in the interrupt handling routine.)
$O$ : The relevant interrupt is used. The interrupt source is not cleared.
$X$ : The relevant bit cannot be used.

* : Don't care

## (4) Usage Note

SCI and A/D converter interrupt sources are cleared when the appropriate DTC register is read or written to, and are independent of the DISEL bit.

## Section 6 Bus Controller

### 6.1 Overview

The H8S/2245 Group has a built-in bus controller (BSC) that manages the external address space divided into eight areas. The bus specifications, such as bus width and number of access states, can be set independently for each area, enabling multiple memories to be connected easily.

The bus controller also has a bus arbitration function, and controls the operation of the internal bus masters: the CPU and the data transfer controller (DTC).

### 6.1.1 Features

The features of the bus controller are listed below.

- Manages external address space in area units
- In advanced mode, manages the external space as 8 areas of 128 -kbytes/2-Mbytes
- In normal mode, manages the external space as a single area
- Bus specifications can be set independently for each area
- Burst ROM interface can be set
- Basic bus interface
— Chip select ( $\overline{\mathrm{CS} 0}$ to $\overline{\mathrm{CS} 3}$ ) can be output for areas 0 to 3
- 8-bit access or 16 -bit access can be selected for each area
- 2-state access or 3-state access can be selected for each area
- Program wait states can be inserted for each area
- Burst ROM interface
- Burst ROM interface can be set for area 0
- 1 -state or 2 -state burst access can be selected
- Idle cycle insertion
- An idle cycle can be inserted in case of an external read cycle between different areas
- An idle cycle can be inserted in case of an external write cycle immediately after an external read cycle
- Bus arbitration function
- Includes a bus arbiter that arbitrates bus mastership among the CPU, and DTC
- Other features
- External bus release function

### 6.1.2 Block Diagram

Figure 6.1 shows a block diagram of the bus controller.

Figure 6.1 Block Diagram of Bus Controller

### 6.1.3 Pin Configuration

Table 6.1 summarizes the pins of the bus controller.
Table 6.1 Bus Controller Pins

| Name | Symbol | I/O | Function |
| :--- | :--- | :--- | :--- |
| Address strobe | $\overline{\mathrm{AS}}$ | Output | Strobe signal indicating that address output on <br> address bus is enabled. |
| Read | $\overline{\mathrm{RD}}$ | Output | Strobe signal indicating that external space is <br> being read. |
| High write | $\overline{\mathrm{HWR}}$ | Output | Strobe signal indicating that external space is <br> to be written, and upper half $\left(\mathrm{D}_{15}\right.$ to $\left.\mathrm{D}_{8}\right)$ of data <br> bus is enabled. |
| Low write | $\overline{\mathrm{LWR}}$ | Output | Strobe signal indicating that external space is <br> to be written, and lower half ( $\mathrm{D}_{7}$ to $\left.\mathrm{D}_{0}\right)$ of data <br> bus is enabled. |
| Chip select 0 | $\overline{\mathrm{CSO}}$ | Output | Strobe signal indicating that area 0 is selected. |
| Chip select 1 | $\overline{\mathrm{CS1}}$ | Output | Strobe signal indicating that area 1 is selected. |
| Chip select 2 | $\overline{\mathrm{CS2}}$ | Output | Strobe signal indicating that area 2 is selected. |

### 6.1.4 Register Configuration

Table 6.2 summarizes the registers of the bus controller.
Table 6.2 Bus Controller Registers

|  |  | Initial Value |  |  |  |
| :--- | :--- | :--- | :--- | :--- | :--- |
| Name | Abbreviation | R/W | Power-On <br> Reset | Manual <br> Reset | Address*¹ |
| Bus width control register | ABWCR | R/W | H'FF/H'00*² | Retained | H'FED0 |
| Access state control register | ASTCR | R/W | H'FF | Retained | H'FED1 |
| Wait control register H | WCRH | R/W | H'FF | Retained | H'FED2 |
| Wait control register L | WCRL | R/W | H'FF | Retained | H'FED3 |
| Bus control register H | BCRH | R/W | H'D0 | Retained | H'FED4 |
| Bus control register L | BCRL | R/W | H'3C | Retained | H'FED5 |

Notes: 1. Lower 16 bits of the address.
2. Determined by the MCU operating mode.

### 6.2 Register Descriptions

### 6.2.1 Bus Width Control Register (ABWCR)

| Bit | : | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | ABW7 | ABW6 | ABW5 | ABW4 | ABW3 | ABW2 | ABW1 | ABW0 |
| Modes 1, 2, 3, 5, 6, 7 |  |  |  |  |  |  |  |  |  |
| Initial value |  | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 |
| R/W | : | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |
| Mode 4 |  |  |  |  |  |  |  |  |  |
| Initial value |  | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | : | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

ABWCR is an 8-bit readable/writable register that designates each area for either 8-bit access or 16-bit access.

ABWCR sets the data bus width for the external memory space. The bus width for on-chip memory and internal I/O registers is fixed regardless of the settings in ABWCR.

In normal mode, the settings of bits ABW7 to ABW1 have no effect on operation.
After a power-on reset and in hardware standby mode, ABWCR is initialized to H'FF in modes 1, 2,3 , and $5,6,7$, and to $\mathrm{H}^{\prime} 00$ in mode 4 . It is not initialized by a manual reset or in software standby mode.

Bits 7 to 0—Area 7 to 0 Bus Width Control (ABW7 to ABW0): These bits select whether the corresponding area is to be designated for 8 -bit access or 16 -bit access. In normal mode, only part of area 0 is enabled, and the ABW0 bit selects whether external space is to be designated for 8 -bit access or 16-bit access.

Bit $n$

| ABWn | Description |
| :--- | :--- |
| 0 | Area n is designated for 16-bit access |
| 1 | Area n is designated for 8-bit access |
| Note: | $\mathrm{n}=7$ to 0 |

### 6.2.2 Access State Control Register (ASTCR)

| Bit | $:$ | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | AST7 | AST6 | AST5 | AST4 | AST3 | AST2 | AST1 | AST0 |  |
|  | Initial value : | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 |
| R/W | $:$ | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

ASTCR is an 8-bit readable/writable register that designates each area as either a 2 -state access space or a 3-state access space.

ASTCR sets the number of access states for the external memory space. The number of access states for on-chip memory and internal I/O registers is fixed regardless of the settings in ASTCR.

In normal mode, the settings of bits AST7 to AST1 have no effect on operation.

ASTCR is initialized to H'FF by a power-on reset and in hardware standby mode. It is not initialized by a manual reset or in software standby mode.

Bits 7 to 0—Area 7 to 0 Access State Control (AST7 to AST0): These bits select whether the corresponding area is to be designated as a 2-state access space or a 3-state access space. In normal mode, only part of area 0 is enabled, and the AST0 bit selects whether external space is to be designated for 2 -state access or 3 -state access.

Wait state insertion is enabled or disabled at the same time.
Bit n
ASTn Description

| 0 | Area $n$ is designated for 2-state access <br> Wait state insertion in area $n$ external space is disabled |  |
| :--- | :--- | :--- |
| 1 | Area $n$ is designated for 3-state access | (Initial value) |
|  | Wait state insertion in area n external space is enabled |  |

Note: $\mathrm{n}=7$ to 0

### 6.2.3 Wait Control Registers H and L (WCRH, WCRL)

WCRH and WCRL are 8-bit readable/writable registers that select the number of program wait states for each area.

In normal mode, only part of area is 0 is enabled, and bits W01 and W00 select the number of program wait states for the external space. The settings of bits W71, W70 to W11, and W10 have no effect on operation.

Program waits are not inserted in the case of on-chip memory or internal I/O registers.
WCRH and WCRL are initialized to H'FF by a power-on reset and in hardware standby mode. They are not initialized by a manual reset or in software standby mode.

## (1) WCRH

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | W71 | W70 | W61 | W60 | W51 | W50 | W41 | W40 |
| Initial value | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

Bits 7 and 6-Area 7 Wait Control 1 and $\mathbf{0}$ (W71, W70): These bits select the number of program wait states when area 7 in external space is accessed while the AST7 bit in ASTCR is set to 1 .

Bit $7 \quad$ Bit 6

| W71 | W70 | Description |
| :--- | :--- | :--- |
| 0 | 0 | Program wait not inserted when external space area 7 is accessed |
|  | 1 | 1 program wait state inserted when external space area 7 is accessed |
| 1 | 0 | 2 program wait states inserted when external space area 7 is accessed |
|  | 3 3 program wait states inserted when external space area 7 is accessed |  |
|  |  | (Initial value) |

Bits 5 and 4—Area 6 Wait Control 1 and 0 (W61, W60): These bits select the number of program wait states when area 6 in external space is accessed while the AST6 bit in ASTCR is set to 1 .

Bit $5 \quad$ Bit 4

| W61 | W60 | Description |
| :--- | :--- | :--- |
| 0 | 0 | Program wait not inserted when external space area 6 is accessed |
|  | 1 | 1 program wait state inserted when external space area 6 is accessed |
| 1 | 0 | 2 program wait states inserted when external space area 6 is accessed |
|  | 3 | 3 program wait states inserted when external space area 6 is accessed |
| (Initial value) |  |  |

Bits 3 and 2—Area 5 Wait Control 1 and 0 (W51, W50): These bits select the number of program wait states when area 5 in external space is accessed while the AST5 bit in ASTCR is set to 1 .

Bit 3 Bit 2

| W51 | W50 | Description |
| :--- | :--- | :--- |
| 0 | 0 | Program wait not inserted when external space area 5 is accessed |
|  | 1 | 1 program wait state inserted when external space area 5 is accessed |
| 1 | 0 | 2 program wait states inserted when external space area 5 is accessed |
|  | 1 | 3 program wait states inserted when external space area 5 is accessed |
| (Initial value) |  |  |

Bits 1 and 0—Area 4 Wait Control 1 and 0 (W41, W40): These bits select the number of program wait states when area 4 in external space is accessed while the AST4 bit in ASTCR is set to 1 .

| Bit 1 | Bit 0 |  |
| :--- | :--- | :--- |
| W41 | W40 | Description |

| 0 | 0 | Program wait not inserted when external space area 4 is accessed |
| :--- | :--- | :--- |
|  | 1 program wait state inserted when external space area 4 is accessed |  |
| 1 | 2 program wait states inserted when external space area 4 is accessed  <br>  3 program wait states inserted when external space area 4 is accessed <br> (Initial value)  |  |

(2) WCRL

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | W31 | W30 | W21 | W20 | W11 | W10 | W01 | W00 |
| Initial value | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

Bits 7 and 6-Area 3 Wait Control 1 and $\mathbf{0}$ (W31, W30): These bits select the number of program wait states when area 3 in external space is accessed while the AST3 bit in ASTCR is set to 1 .

## Bit 7 Bit 6

| W31 | W30 | Description |
| :--- | :--- | :--- |
| 0 | 0 | Program wait not inserted when external space area 3 is accessed |
|  | 1 | 1 program wait state inserted when external space area 3 is accessed |
| 1 | 0 | 2 program wait states inserted when external space area 3 is accessed |

Bits 5 and 4—Area 2 Wait Control 1 and $\mathbf{0}$ (W21, W20): These bits select the number of program wait states when area 2 in external space is accessed while the AST2 bit in ASTCR is set to 1 .

| Bit 5 | Bit 4 | Description |
| :---: | :---: | :---: |
| W21 | W20 |  |
| 0 | 0 | Program wait not inserted when external space area 2 is accessed |
|  | 1 | 1 program wait state inserted when external space area 2 is accessed |
| 1 | 0 | 2 program wait states inserted when external space area 2 is accessed |
|  | 1 | 3 program wait states inserted when external space area 2 is accessed (Initial value) |

Bits 3 and 2—Area 1 Wait Control 1 and 0 (W11, W10): These bits select the number of program wait states when area 1 in external space is accessed while the AST1 bit in ASTCR is set to 1 .

Bit 3 Bit 2

| W11 | W10 | Description |
| :--- | :--- | :--- |
| 0 | 0 | Program wait not inserted when external space area 1 is accessed |
|  | 1 | 1 program wait state inserted when external space area 1 is accessed |
| 1 | 0 | 2 program wait states inserted when external space area 1 is accessed |
| 1 | 3 program wait states inserted when external space area 1 is accessed |  |
| (Initial value) |  |  |

Bits 1 and 0—Area 0 Wait Control 1 and 0 (W01, W00): These bits select the number of program wait states when area 0 in external space is accessed while the AST0 bit in ASTCR is set to 1 .

Bit 1 Bit 0

| W01 | W00 | Description |
| :--- | :--- | :--- |
| 0 | 0 | Program wait not inserted when external space area 0 is accessed |
|  | 1 | 1 program wait state inserted when external space area 0 is accessed |
| 1 | 0 | 2 program wait states inserted when external space area 0 is accessed |
|  | 3 program wait states inserted when external space area 0 is accessed |  |
|  |  |  |
|  |  |  |
|  |  |  |

### 6.2.4 Bus Control Register H (BCRH)

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | ICIS1 | ICIS0 | BRSTRM | BRSTS1 | BRSTS0 | - | - | - |
| Initial value | 1 | 1 | 0 | 1 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | (R/W) | (R/W) | (R/W) |

BCRH is an 8-bit readable/writable register that selects enabling or disabling of idle cycle insertion, and the memory interface for area 0.

BCRH is initialized to H'D0 by a power-on reset and in hardware standby mode. It is not initialized by a manual reset or in software standby mode.

Bit 7—Idle Cycle Insert 1 (ICIS1): Selects whether or not one idle cycle state is to be inserted between bus cycles when successive external read cycles are performed in different areas.

## Bit 7

| ICIS1 | Description |
| :--- | :--- |
| 0 | Idle cycle not inserted in case of successive external read cycles in different areas. |
| 1 | Idle cycle inserted in case of successive external read cycles in different areas. |
|  | (Initial value) |

Bit 6-Idle Cycle Insert 0 (ICIS0): Selects whether or not one idle cycle state is to be inserted between bus cycles when successive external read and external write cycles are performed.

Bit 6
ICIS0 Description

| 0 | Idle cycle not inserted in case of successive external read and external write cycles. |
| :--- | :--- |
| 1 | Idle cycle inserted in case of successive external read and external write cycles. |
| (Initial value) |  |

Bit 5—Burst ROM Enable (BRSTRM): Selects whether area 0 is used as a burst ROM interface. In normal mode, the selection can be made from the entire external space.

## Bit 5

| BRSTRM | Description |  |
| :--- | :--- | :--- |
| 0 | Area 0 is basic bus interface | (Initial value) |
| 1 | Area 0 is burst ROM interface |  |

Bit 4—Burst Cycle Select 1 (BRSTS1): Selects the number of burst cycles for the burst ROM interface.

Bit 4
BRSTS1 Description

| 0 | Burst cycle comprises 1 state |  |
| :--- | :--- | :--- |
| 1 | Burst cycle comprises 2 states | (Initial value) |

Bit 3—Burst Cycle Select 0 (BRSTS0): Selects the number of words that can be accessed in a burst ROM interface burst access.

Bit 3
BRSTS0 Description

| 0 | Max. 4 words in burst access | (Initial value) |
| :--- | :--- | :---: |
| 1 | Max. 8 words in burst access |  |

Bits 2 to 0—Reserved: Only 0 should be written to these bits.

### 6.2.5 Bus Control Register L (BCRL)

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | BRLE | BREQOE | EAE | - | - | ASS | - | WAITE |
| Initial value | 0 | 0 | 1 | 1 | 1 | 1 | 0 | 0 |
| R/W | R/W | R/W | R/W | (R/W) | (R/W) | R/W | (R/W) | R/W |

BCRL is an 8-bit readable/writable register that performs selection of the external bus release state protocol, selection of the area partition unit and enabling or disabling of $\overline{\text { WAIT }}$ pin input.

BCRL is initialized to $\mathrm{H}^{\prime} 3 \mathrm{C}$ by a power-on reset and in hardware standby mode. It is not initialized by a manual reset or in software standby mode.

Bit 7—Bus Release Enable (BRLE): Enables or disables external bus release.
Bit 7
BRLE Description

| $0 \quad$ External bus release is disabled. $\overline{\mathrm{BREQ}}, \overline{\mathrm{BACK}}$, and $\overline{\mathrm{BREQO}}$ can be used as I/O ports. |
| ---: |
| (Initial value) |

1 External bus release is enabled.

Bit 6-BREQO Pin Enable (BREQOE): Outputs a signal that requests the external bus master to drop the bus request signal ( $\overline{\mathrm{BREQ}})$ in the external bus release state, when an internal bus master performs an external space access.

Bit 6
BREQOE Description

| 0 | $\overline{B R E Q O}$ output disabled. $\overline{\mathrm{BREQO}}$ can be used as I/O port. | (Initial value) |
| :--- | :--- | :--- |
| 1 | $\overline{\mathrm{BREQO}}$ output enabled. |  |

Bit 5—External Address Enable (EAE): Selects whether addresses H'010000 to H'01FFFF are to be internal addresses or external addresses.

This setting is invalid in normal mode.
Bit 5
EAE Description

| 0 | Addresses H'010000 to H'01FFFF are in on-chip ROM (H8S/2246 and H8S/2245) or <br> a reserved area* (H8S/2244, H8S/2243, H8S/2242, and H8S/2241). |
| :--- | :--- |
| 1 | Addresses H'010000 to H'01FFFF are external addresses (external expansion mode) <br> or a reserved area* (single-chip mode). <br> (Initial value) |

Note: * Reserved areas should not be accessed.

Bits 4 and 3-Reserved: Only 1 should be written to these bits.
Bit 2—Area Partition Unit Select (ASS): Selects the area partition unit.
Bit 2
ASS Description

| 0 | Area partition unit is 128 kbytes (1 Mbit) |  |
| :--- | :--- | :--- |
| 1 | Area partition unit is 2 Mbytes (16 Mbits) | (Initial value) |

Bit 1—Reserved: Only 0 should be written to this bit.
Bit 0-WAIT Pin Enable (WAITE): Selects enabling or disabling of wait input by the $\overline{\text { WAIT }}$ pin.

Bit 0
WAITE Description

| 0 | Wait input by $\overline{\text { WAIT }}$ pin disabled. $\overline{\text { WAIT }}$ pin can be used as I/O port. | (Initial value) |
| :--- | :--- | :--- |
| 1 | Wait input by $\overline{\text { WAIT }}$ pin enabled |  |

### 6.3 Overview of Bus Control

### 6.3.1 Area Partitioning

In advanced mode, the bus controller partitions the 16 Mbytes address space into eight areas, 0 to 7, in 128-kbyte or 2-Mbyte units, and performs bus control for external space in area units. In normal mode, it controls a 64 -kbyte address space comprising part of area 0 . Figure 6.2 shows an outline of the memory map.

Chip select signals ( $\overline{\mathrm{CS} 0}$ to $\overline{\mathrm{CS} 3}$ ) can be output for areas 0 to 3 .

Figure 6.2 Overview of Area Partitioning

### 6.3.2 Bus Specifications

The external space bus specifications consist of three elements: (1) bus width, (2) number of access states, and (3) number of program wait states.

The bus width and number of access states for on-chip memory and internal I/O registers are fixed, and are not affected by the bus controller.
(1) Bus Width: A bus width of 8 or 16 bits can be selected with ABWCR. An area for which an 8 -bit bus is selected functions as an 8-bit access space, and an area for which a 16-bit bus is selected functions as a16-bit access space.

If all areas are designated for 8 -bit access, 8 -bit bus mode is set; if any area is designated for 16-bit access, 16 -bit bus mode is set. When the burst ROM interface is designated, 16 -bit bus mode is always set.
(2) Number of Access States: Two or three access states can be selected with ASTCR. An area for which 2-state access is selected functions as a 2-state access space, and an area for which 3state access is selected functions as a 3-state access space.

With the burst ROM interface, the number of states is one or two regardless of the ASTCR setting.
When 2-state access space is designated, wait insertion is disabled.
(3) Number of Program Wait States: When 3-state access space is designated by ASTCR, the number of program wait states to be inserted automatically is selected with WCRH and WCRL. From 0 to 3 program wait states can be selected.

Table 6.3 shows the bus specifications for each basic bus interface area.
Table 6.3 Bus Specifications for Each Area (Basic Bus Interface)

| ABWCR | ASTCR | WCRH | WCRL | Bus Specifications (Basic Bus Interface) |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| ABWn | ASTn | Wn1 | Wno | Bus Width | Access States | Program Wait States |
| 0 | 0 | - | - | 16 | 2 | 0 |
|  | 1 | 0 | 0 |  | 3 | 0 |
|  |  |  | 1 |  |  | 1 |
|  |  | 1 | 0 |  |  | 2 |
|  |  |  | 1 |  |  | 3 |
| 1 | 0 | - | - | 8 | 2 | 0 |
|  | 1 | 0 | 0 |  | 3 | 0 |
|  |  |  | 1 |  |  | 1 |
|  |  | 1 | 0 |  |  | 2 |
|  |  |  | 1 |  |  | 3 |

### 6.3.3 Memory Interfaces

The H8S/2245 Group memory interfaces comprise a basic bus interface that allows direct connection of ROM, SRAM, and so on; and a burst ROM interface that allows direct connection of burst ROM.

An area for which the basic bus interface is designated functions as normal space, and an area for which the burst ROM interface is designated functions as burst ROM space.

### 6.3.4 Advanced Mode

The initial state of each area is basic bus interface, 3-state access space. The initial bus width is selected according to the operating mode. The bus specifications described here cover basic items only, and the sections on each memory interface should be referred to for further details.

## Area 0

Area 0 includes on-chip ROM, and in ROM-disabled expansion mode, all of area 0 is external space. In ROM-enabled expansion mode, the space excluding on-chip ROM is external space.

When area 0 external space is accessed, the $\overline{\mathrm{CSO}}$ signal can be output.
Either basic bus interface or burst ROM interface can be selected for area 0 .
The size of area 0 is switched between 128 kbytes and 2 Mbytes according to the state of the ASS bit.

## Areas 1 to 6

In external expansion mode, all of area 1 to 6 is external space.
When area 1 to 3 external space is accessed, the $\overline{\mathrm{CS} 1}$ and $\overline{\mathrm{CS} 3}$ pin signals respectively can be output.

Only the basic bus interface can be used for areas 1 and 6.

The size of areas 1 to 6 is switched between 128 kbytes and 2 Mbytes according to the state of the ASS bit.

## Area 7

Area 7 includes the on-chip RAM and internal I/O registers. In external expansion mode, the space excluding the on-chip RAM and internal I/O registers is external space. The on-chip RAM is enabled when the RAME bit in the system control register (SYSCR) is set to 1 ; when the RAME bit is cleared to 0 , the on-chip RAM is disabled and the corresponding space becomes external space.

Only the basic bus interface can be used for the area 7.
The size of area 7 is switched between 15 Mbytes and 2 Mbytes according to the state of the ASS bit.

### 6.3.5 Areas in Normal Mode

In normal mode, a 64-kbyte address space comprising part of area 0 is controlled. Area partitioning is not performed in normal mode. In ROM-disabled expansion mode, the space excluding the on-chip RAM and internal I/O registers is external space. In ROM-enabled expansion mode the space excluding the on-chip ROM, on-chip RAM, and internal I/O registers is external space. The on-chip RAM is enabled when the RAME bit in the system control register (SYSCR) is set to 1 ; when the RAME bit is cleared to 0 , the on-chip RAM is disabled and the corresponding addresses become external space.

When external space is accessed, the $\overline{\mathrm{CS} 0}$ signal can be output.

In normal mode, the basic bus interface or burst ROM interface can be selected.

### 6.3.6 Chip Select Signals

The H8S/2245 Group can output chip select signals ( $\overline{\mathrm{CS} 0}$ to $\overline{\mathrm{CS} 3}$ ) to areas 0 to 3 , the signal being driven low when the corresponding external space area is accessed. In normal mode, only the $\overline{\mathrm{CS} 0}$ signal can be output.

Figure 6.3 shows an example of $\overline{\mathrm{CSn}}(\mathrm{n}=0$ to 3$)$ output timing.
Enabling or disabling of the $\overline{\mathrm{CSn}}$ signal is performed by setting the data direction register (DDR) for the port corresponding to the particular $\overline{\mathrm{CSn}}$ pin.

In ROM-disabled expansion mode, the $\overline{\mathrm{CS} 0}$ pin is placed in the output state after a power-on reset. Pins $\overline{\mathrm{CS} 1}$ to $\overline{\mathrm{CS} 3}$ are placed in the input state after a power-on reset, and so the corresponding DDR should be set to 1 when outputting signals $\overline{\mathrm{CS} 1}$ to $\overline{\mathrm{CS} 3}$.

In ROM-enabled expansion mode, pins $\overline{\mathrm{CS} 0}$ to $\overline{\mathrm{CS} 3}$ are all placed in the input state after a poweron reset, and so the corresponding DDR should be set to 1 when outputting signals $\overline{\mathrm{CS} 0}$ to $\overline{\mathrm{CS}} 3$.

For details, see section 8, I/O Ports.

Figure $6.3 \overline{\mathrm{CSn}}$ Signal Output Timing ( $\mathrm{n}=0$ to 3 )

### 6.4 Basic Timing

The CPU is driven by a system clock $(\phi)$, denoted by the symbol $\phi$. The period from one rising edge of $\phi$ to the next is referred to as a "state." The memory cycle or bus cycle consists of one, two, or three states. Different methods are used to access on-chip memory, on-chip peripheral modules, and the external address space.

### 6.4.1 On-Chip Memory (ROM, RAM) Access Timing

On-chip memory is accessed in one state. The data bus is 16 bits wide, permitting both byte and word transfer instruction. Figure 6.4 shows the on-chip memory access cycle. Figure 6.5 shows the pin states.

Figure 6.4 On-Chip Memory Access Cycle

Figure 6.5 Pin States during On-Chip Memory Access

### 6.4.2 On-Chip Peripheral Module Access Timing

The on-chip peripheral modules are accessed in two states. The data bus is either 8 bits or 16 bits wide, depending on the particular internal I/O register being accessed. Figure 6.6 shows the access timing for the on-chip peripheral modules. Figure 6.7 shows the pin states.

Figure 6.6 On-Chip Peripheral Module Access Cycle

Figure 6.7 Pin States during On-Chip Peripheral Module Access

### 6.4.3 External Address Space Access Timing

The external address space is accessed with an 8-bit or 16-bit data bus width in a two-state or three-state bus cycle. In three-state access, wait states can be inserted. For further details, refer to section 6.5.4, Basic Timing.

### 6.5 Basic Bus Interface

### 6.5.1 Overview

The basic bus interface enables direct connection of ROM, SRAM, and so on.

The bus specifications can be selected with ABWCR, ASTCR, WCRH, and WCRL (see table 6.3).

### 6.5.2 Data Size and Data Alignment

Data sizes for the CPU and other internal bus masters are byte, word, and longword. The bus controller has a data alignment function, and when accessing external space, controls whether the upper data bus $\left(D_{15}\right.$ to $\left.D_{8}\right)$ or lower data bus $\left(D_{7}\right.$ to $\left.D_{0}\right)$ is used according to the bus specifications for the area being accessed (8-bit access space or 16-bit access space) and the data size.

## 8-Bit Access Space

Figure 6.8 illustrates data alignment control for the 8 -bit access space. With the 8 -bit access space, the upper data bus $\left(\mathrm{D}_{15}\right.$ to $\left.\mathrm{D}_{8}\right)$ is always used for accesses. The amount of data that can be accessed at one time is one byte: a word transfer instruction is performed as two byte accesses, and a longword transfer instruction, as four byte accesses.

|  |  | Upper data bus Lower data bus |  |
| :---: | :---: | :---: | :---: |
|  |  | $\mathrm{D}_{15} \quad \mathrm{D}_{81} \mathrm{D}_{7}$ | $\mathrm{D}_{0}$ |
| Byte size |  | 1 1 1  <br> 1    |  |
| Word size | $\left[\begin{array}{l}1 s t \\ \text { 2nd bus cycle } \\ \text { cycle }\end{array}\right.$ |       <br>  Lla     <br>       <br>       |  |
| Longword size | $\left[\begin{array}{l}\text { 1st bus cycle } \\ \text { 2nd bus cycle } \\ \text { 3rd bus cycle } \\ 4 \text { th bus cycle }\end{array}\right.$ |  |  |

Figure 6.8 Access Sizes and Data Alignment Control (8-Bit Access Space)

## 16-Bit Access Space

Figure 6.9 illustrates data alignment control for the 16-bit access space. With the 16-bit access space, the upper data bus $\left(D_{15}\right.$ to $\left.D_{8}\right)$ and lower data bus $\left(D_{7}\right.$ to $\left.D_{0}\right)$ are used for accesses. The amount of data that can be accessed at one time is one byte or one word, and a longword transfer instruction is executed as two word transfer instructions.

In byte access, whether the upper or lower data bus is used is determined by whether the address is even or odd. The upper data bus is used for an even address, and the lower data bus for an odd address.

|  |  | Upper data bus Lower data bus |  |  |
| :---: | :---: | :---: | :---: | :---: |
|  |  | $\mathrm{D}_{15}$ | $\mathrm{D}_{8}, \mathrm{D}_{7}$ | $\mathrm{D}_{0}$ |
| Byte size | - Even address |  |  |  |
| Byte size | - Odd address |  |  |  |
| Word size |  |  |  |  |
| Longword size | $\left[\begin{array}{l}1 \text { st bus cycle } \\ \text { 2nd bus cycle }\end{array}\right.$ | $1 \times$ | $\square$ |  |

Figure 6.9 Access Sizes and Data Alignment Control (16-Bit Access Space)

### 6.5.3 Valid Strobes

Table 6.4 shows the data buses used and valid strobes for the access spaces.
In a read, the $\overline{\mathrm{RD}}$ signal is valid without discrimination between the upper and lower halves of the data bus.

In a write, the $\overline{H W R}$ signal is valid for the upper half of the data bus, and the $\overline{\mathrm{LWR}}$ signal for the lower half.

Table 6.4 Data Buses Used and Valid Strobes

| Area | Access Size | Read/ Write | Address | Valid Strobe | Upper Data Bus $\left(D_{15} \text { to } D_{8}\right)$ | Lower data bus ( $D_{7}$ to $D_{0}$ ) |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 8-bit access space | Byte | Read | - | $\overline{\mathrm{RD}}$ | Valid | Invalid |
|  |  | Write | - | $\overline{\text { HWR }}$ |  | $\mathrm{Hi}-\mathrm{Z}$ |
| 16-bit access space | Byte | Read | Even | $\overline{\mathrm{RD}}$ | Valid | Invalid |
|  |  |  | Odd |  | Invalid | Valid |
|  |  | Write | Even | $\overline{\text { HWR }}$ | Valid | $\mathrm{Hi}-\mathrm{Z}$ |
|  |  |  | Odd | $\overline{\text { LWR }}$ | $\mathrm{Hi}-\mathrm{Z}$ | Valid |
|  | Word | Read | - | $\overline{\mathrm{RD}}$ | Valid | Valid |
|  |  | Write | - | $\overline{\text { HWR, }} \overline{\text { LWR }}$ | Valid | Valid |

Note: Invalid: Input state; input value is ignored.
$\mathrm{Hi}-\mathrm{Z}:$ High impedance.

### 6.5.4 Basic Timing

(1) 8-Bit 2-State Access Space

Figure 6.10 shows the bus timing for an 8 -bit 2 -state access space. When an 8 -bit access space is accessed, the upper half $\left(D_{15}\right.$ to $\left.D_{8}\right)$ of the data bus is used.

The $\overline{\text { LWR }}$ pin is fixed high. Wait states cannot be inserted.

Note: $\mathrm{n}=0$ to 3
Figure 6.10 Bus Timing for 8-Bit 2-State Access Space

## (2) 8-Bit 3-State Access Space

Figure 6.11 shows the bus timing for an 8 -bit 3-state access space. When an 8-bit access space is accessed, the upper half $\left(D_{15}\right.$ to $\left.D_{8}\right)$ of the data bus is used.

The $\overline{L W R}$ pin is fixed high. Wait states can be inserted.

Note: $\mathrm{n}=0$ to 3
Figure 6.11 Bus Timing for 8-Bit 3-State Access Space

## (3) 16-Bit 2-State Access Space

Figures 6.12 to 6.14 show bus timings for a 16-bit 2-state access space. When a 16 -bit access space is accessed, the upper half $\left(\mathrm{D}_{15}\right.$ to $\left.\mathrm{D}_{8}\right)$ of the data bus is used for the even address, and the lower half $\left(\mathrm{D}_{7}\right.$ to $\left.\mathrm{D}_{0}\right)$ for the odd address.

Wait states cannot be inserted.

Note: $\mathrm{n}=0$ to 3
Figure 6.12 Bus Timing for 16-Bit 2-State Access Space (1) (Even Address Byte Access)

Note: $\mathrm{n}=0$ to 3
Figure 6.13 Bus Timing for 16-Bit 2-State Access Space (2) (Odd Address Byte Access)

Figure 6.14 Bus Timing for 16-Bit 2-State Access Space (3) (Word Access)

## (4) 16-Bit 3-State Access Space

Figures 6.15 to 6.17 show bus timings for a 16-bit 3-state access space. When a 16-bit access space is accessed, the upper half $\left(\mathrm{D}_{15}\right.$ to $\left.\mathrm{D}_{8}\right)$ of the data bus is used for the odd address, and the lower half $\left(D_{7}\right.$ to $\left.D_{0}\right)$ for the even address.

Wait states can be inserted.

Note: $\mathrm{n}=0$ to 3
Figure 6.15 Bus Timing for 16-Bit 3-State Access Space (1) (Even Address Byte Access)

Note: $\mathrm{n}=0$ to 3

Figure 6.16 Bus Timing for 16-Bit 3-State Access Space (2) (Odd Address Byte Access)

Note: $\mathrm{n}=0$ to 3
Figure 6.17 Bus Timing for 16-Bit 3-State Access Space (3) (Word Access)

### 6.5.5 Wait Control

When accessing external space, the H8S/2245 Group can extend the bus cycle by inserting one or more wait states $\left(\mathrm{T}_{\mathrm{w}}\right)$. There are two ways of inserting wait states: (1) program wait insertion and (2) pin wait insertion using the $\overline{\text { WAIT }}$ pin.

## (1) Program Wait Insertion

From 0 to 3 wait states can be inserted automatically between the $T_{2}$ state and $T_{3}$ state on an individual area basis in 3-state access space, according to the settings of WCRH and WCRL.

## (2) Pin Wait Insertion Using WAIT Pin

Setting the WAITE bit in BCRL to 1 enables wait insertion by means of the $\overline{\mathrm{WAIT}}$ pin. Program wait insertion is first carried out according to the settings in WCRH and WCRL. Then, if the $\overline{\text { WAIT }}$ pin is low at the falling edge of $\phi$ in the last $T_{2}$ or $T_{w}$ state, a $T_{w}$ state is inserted. If the $\overline{\text { WAIT }}$ pin is held low, $\mathrm{T}_{\mathrm{w}}$ states are inserted until it goes high.

This is useful when inserting four or more $\mathrm{T}_{\mathrm{w}}$ states, or when changing the number of $\mathrm{T}_{\mathrm{w}}$ states for different external devices.

The WAITE bit setting applies to all areas.

Figure 6.18 shows an example of wait state insertion timing.

Note: $\not \subset$ indicates the timing of $\overline{\text { WAIT }}$ pin sampling.
Figure 6.18 Example of Wait State Insertion Timing
The settings after a power-on reset are: 3 -state access, 3 program wait state insertion, and WAIT input disabled. When a manual reset is performed, the contents of bus controller registers are retained, and the wait control settings remain the same as before the reset.

### 6.6 Burst ROM Interface

### 6.6.1 Overview

With the H8S/2245 Group, external space area 0 can be designated as burst ROM space, and burst ROM interfacing can be performed. The burst ROM space interface enables 16-bit configuration ROM with burst access capability to be accessed at high speed.

Area 0 can be designated as burst ROM space by means of the BRSTRM bit in BCRH. Consecutive burst accesses of a maximum of 4 words or 8 words can be performed for CPU instruction fetches only. One or two states can be selected for burst access.

### 6.6.2 Basic Timing

The number of states in the initial cycle (full access) of the burst ROM interface is in accordance with the setting of the AST0 bit in ASTCR. Also, when the AST0 bit is set to 1, wait state insertion is possible. One or two states can be selected for the burst cycle, according to the setting of the BRSTS1 bit in BCRH. Wait states cannot be inserted. When area 0 is designated as burst ROM space, it becomes 16-bit access space regardless of the setting of the ABW0 bit in ABWCR.

When the BRSTS0 bit in BCRH is cleared to 0 , burst access of up to 4 words is performed; when the BRSTS0 bit is set to 1 , burst access of up to 8 words is performed.

The basic access timing for burst ROM space is shown in figures 6.19 (a) and (b). The timing shown in figure 6.19 (a) is for the case where the AST0 and BRSTS1 bits are both set to 1 , and that in figure 6.19 (b) is for the case where both these bits are cleared to 0 .

Figure 6.19 (a) Example of Burst ROM Access Timing (When AST0 $=$ BRSTS1 = 1)

Figure 6.19 (b) Example of Burst ROM Access Timing (When AST0 = BRSTS1 = 0)

### 6.6.3 Wait Control

As with the basic bus interface, either program wait insertion or pin wait insertion using the WAIT pin can be used in the initial cycle (full access) of the burst ROM interface. See section 6.5.5, Wait Control.

Wait states cannot be inserted in a burst cycle.

### 6.7 Idle Cycle

### 6.7.1 Operation

When the H8S/2245 Group accesses external space, it can insert a 1 -state idle cycle ( $\mathrm{T}_{\mathrm{t}}$ ) between bus cycles in the following two cases: (1) when read accesses between different areas occur consecutively, and (2) when a write cycle occurs immediately after a read cycle. By inserting an idle cycle it is possible, for example, to avoid data collisions between ROM, with a long output floating time, and high-speed memory, I/O interfaces, and so on.

## (1) Consecutive Reads between Different Areas

If consecutive reads between different areas occur while the ICIS1 bit in BCRH is set to 1, an idle cycle is inserted at the start of the second read cycle. This is enabled in advanced mode.

Figure 6.20 shows an example of the operation in this case. In this example, bus cycle A is a read cycle from ROM with a long output floating time, and bus cycle B is a read cycle from SRAM, each being located in a different area. In (a), an idle cycle is not inserted, and a collision occurs in cycle B between the read data from ROM and that from SRAM. In (b), an idle cycle is inserted, and a data collision is prevented.

Figure 6.20 Example of Idle Cycle Operation (1)

## (2) Write after Read

If an external write occurs after an external read while the ICIS0 bit in BCRH is set to 1 , an idle cycle is inserted at the start of the write cycle. This is enabled in advanced mode and normal mode.

Figure 6.21 shows an example of the operation in this case. In this example, bus cycle A is a read cycle from ROM with a long output floating time, and bus cycle B is a CPU write cycle. In (a), an idle cycle is not inserted, and a collision occurs in cycle B between the read data from ROM and the CPU write data. In (b), an idle cycle is inserted, and a data collision is prevented.

Figure 6.21 Example of Idle Cycle Operation (2)

## (3) Relationship between Chip Select $(\overline{\mathrm{CS}})$ Signal and Read $(\overline{\mathrm{RD}})$ Signal

Depending on the system's load conditions, the $\overline{\mathrm{RD}}$ signal may lag behind the $\overline{\mathrm{CS}}$ signal. An example is shown in figure 6.22.

In this case, with the setting for no idle cycle insertion (a), there may be a period of overlap between the bus cycle $\mathrm{A} \overline{\mathrm{RD}}$ signal and the bus cycle $\mathrm{B} \overline{\mathrm{CS}}$ signal.

Setting idle cycle insertion, as in (b), however, will prevent any overlap between the $\overline{\mathrm{RD}}$ and $\overline{\mathrm{CS}}$ signals.

In the initial state after reset release, idle cycle insertion (b) is set.

Figure 6.22 Relationship between Chip Select ( $\overline{\mathbf{C S}})$ and Read ( $\overline{\mathrm{RD}})$

### 6.7.2 Pin States in Idle Cycle

Table 6.5 shows pin states in an idle cycle.
Table 6.5 Pin States in Idle Cycle

| Pins | Pin State |
| :--- | :--- |
| $\mathrm{A}_{23}$ to $A_{0}$ | Contents of next bus cycle |
| $\bar{D}_{15}$ to $D_{0}$ | High impedance |
| $\overline{\overline{C S n}}$ | High |
| $\overline{\overline{\mathrm{AS}}}$ | High |
| $\overline{\overline{\mathrm{RD}}}$ | High |
| $\overline{\overline{\operatorname{WNR}}}$ | High |
| $\overline{\mathrm{LWR}}$ | High |

### 6.8 Bus Release

### 6.8.1 Overview

The H8S/2245 Group can release the external bus in response to a bus request from an external device. In the external bus released state, the internal bus master continues to operate as long as there is no external access.

If an internal bus master wants to make an external access in the external bus released state, it can issue a bus request off-chip.

### 6.8.2 Operation

In external expansion mode, the bus can be released to an external device by setting the BRLE bit in BCRL to 1 . Driving the $\overline{\mathrm{BREQ}}$ pin low issues an external bus request to the H8S/2245 Group. When the $\overline{\mathrm{BREQ}}$ pin is sampled, at the prescribed timing the $\overline{\mathrm{BACK}}$ pin is driven low, and the address bus, data bus, and bus control signals are placed in the high-impedance state, establishing the external bus-released state.

In the external bus released state, an internal bus master can perform accesses using the internal bus. When an internal bus master wants to make an external access, it temporarily defers activation of the bus cycle, and waits for the bus request from the external bus master to be dropped.

If the BREQOE bit in BCRL is set to 1 , when an internal bus master wants to make an external access in the external bus released state, the $\overline{\mathrm{BREQO}}$ pin is driven low and a request can be made off-chip to drop the bus request.

When the $\overline{\mathrm{BREQ}}$ pin is driven high, the $\overline{\mathrm{BACK}}$ pin is driven high at the prescribed timing and the external bus released state is terminated.

In the event of simultaneous external bus release request, and external access request generation, the order of priority is as follows:
(High) External bus release > Internal bus master external access (Low)

### 6.8.3 Pin States in External Bus Released State

Table 6.6 shows pin states in the external bus released state.
Table 6.6 Pin States in Bus Released State

| Pins | Pin State |
| :--- | :--- |
| $\mathrm{A}_{23}$ to $A_{0}$ | High impedance |
| $\mathrm{D}_{15}$ to $\mathrm{D}_{0}$ | High impedance |
| $\overline{\mathrm{CSn}}$ | High impedance |
| $\overline{\overline{\mathrm{AS}}}$ | High impedance |
| $\overline{\overline{\mathrm{RD}}}$ | High impedance |
| $\overline{\mathrm{HWR}}$ | High impedance |
| $\overline{\overline{\mathrm{LWR}}}$ | High impedance |

### 6.8.4 Transition Timing

Figure 6.23 shows the timing for transition to the bus-released state.

Figure 6.23 Bus-Released State Transition Timing

### 6.8.5 Usage Note

When MSTPCR has been set to H'FFFF or H'EFFF and a transition has been made to sleep mode, the external bus release function is stopped. If the external bus release function is to be used in sleep mode, H'FFFF or H'EFFF should not be set in MSTPCR.

### 6.9 Bus Arbitration

### 6.9.1 Overview

The H8S/2245 Group has a bus arbiter that arbitrates bus master operations.
There are two bus masters, the CPU and DTC, which perform read/write operations when they have possession of the bus. Each bus master requests the bus by means of a bus request signal. The bus arbiter determines priorities at the prescribed timing, and permits use of the bus by means of a bus request acknowledge signal. The selected bus master then takes possession of the bus and begins its operation.

### 6.9.2 Operation

The bus arbiter detects the bus masters' bus request signals, and if the bus is requested, sends a bus request acknowledge signal to the bus master making the request. If there are bus requests from more than one bus master, the bus request acknowledge signal is sent to the one with the highest priority. When a bus master receives the bus request acknowledge signal, it takes possession of the bus until that signal is canceled.

The order of priority of the bus masters is as follows:
(High) DTC > CPU (Low)
An internal bus access by an internal bus master, and external bus release, can be executed in parallel.

In the event of simultaneous external bus release request, and internal bus master external access request generation, the order of priority is as follows:
(High) External bus release > Internal bus master external access (Low)

### 6.9.3 Bus Transfer Timing

Even if a bus request is received from a bus master with a higher priority than that of the bus master that has acquired the bus and is currently operating, the bus is not necessarily transferred immediately. There are specific times at which each bus master can relinquish the bus.

## CPU

The CPU is the lowest-priority bus master, and if a bus request is received from the DTC, the bus arbiter transfers the bus to the bus master that issued the request. The timing for transfer of the bus is as follows:

- The bus is transferred at a break between bus cycles. However, if a bus cycle is executed in discrete operations, as in the case of a longword-size access, the bus is not transferred between the operations.
- If the CPU is in sleep mode, it transfers the bus immediately.

## DTC

The DTC sends the bus arbiter a request for the bus when an activation request is generated.
The DTC can release the bus after a vector read, a register information read ( 3 states), a single data transfer, or a register information write (3 states). It does not release the bus during a register information read (3 states), a single data transfer, or a register information write (3 states).

### 6.9.4 External Bus Release Usage Note

External bus release can be performed on completion of an external bus cycle. The $\overline{\mathrm{RD}}$ signal remains low until the end of the external bus cycle. Therefore, when external bus release is performed, the $\overline{\mathrm{RD}}$ signal may change from the low level to the high-impedance state.

### 6.10 Resets and the Bus Controller

In a power-on reset, the $\mathrm{H} 8 \mathrm{~S} / 2245$, including the bus controller, enters the reset state at that point, and an executing bus cycle is discontinued.

In a manual reset, the bus controller's registers and internal state are maintained, and an executing external bus cycle is completed. In this case, $\overline{\text { WAIT }}$ input is ignored and write data is not guaranteed.

## Section 7 Data Transfer Controller

### 7.1 Overview

The H8S/2245 Group includes a data transfer controller (DTC). The DTC can be activated by an interrupt or software, to transfer data.

### 7.1.1 Features

- Transfer possible over any number of channels
- Transfer information is stored in memory
- One activation source can trigger a number of data transfers (chain transfer)
- Wide range of transfer modes
- Normal, repeat, and block transfer modes available
- Incrementing, decrementing, and fixing of source and destination addresses can be selected
- Direct specification of $16-\mathrm{Mbyte}$ address space possible
- 24-bit transfer source and destination addresses can be specified
- Transfer can be set in byte or word units
- A CPU interrupt can be requested for the interrupt that activated the DTC
- An interrupt request can be issued to the CPU after one data transfer ends
- An interrupt request can be issued to the CPU after the specified data transfers have completely ended
- Activation by software is possible
- Module stop mode can be set
- The initial setting enables DTC registers to be accessed. DTC operation is halted by setting module stop mode.

### 7.1.2 Block Diagram

Figure 7.1 shows a block diagram of the DTC.
The DTC's register information is stored in the on-chip RAM*. A 32-bit bus connects the DTC to the on-chip RAM (1 kbyte), enabling 32-bit/1-state reading and writing of the DTC register information and hence helping to increase processing speed.

Note: * When the DTC is used, the RAME bit SYSCR must be set to 1 .

Figure 7.1 Block Diagram of DTC

### 7.1.3 Register Configuration

Table 7.1 summarizes the DTC registers.

## Table 7.1 DTC Registers

| Name | Abbreviation | R/W | Initial Value | Address*1 |
| :--- | :--- | :--- | :--- | :--- |
| DTC mode register A | MRA | $-*^{2}$ | Undefined | $-*^{3}$ |
| DTC mode register B | MRB | $-*^{2}$ | Undefined | $-*^{3}$ |
| DTC source address register | SAR | $-*^{2}$ | Undefined | $-*^{3}$ |
| DTC destination address register | DAR | $-*^{2}$ | Undefined | $-*^{3}$ |
| DTC transfer count register A | CRA | $-*^{2}$ | Undefined | $-*^{3}$ |
| DTC transfer count register B | CRB | $-*^{2}$ | Undefined | $-*^{3}$ |
| DTC enable registers | DTCER | R/W | H'00 | H'FF30 to H'FF35 |
| DTC vector register | DTVECR | R/W | H'00 | H'FF37 |
| Module stop control register | MSTPCR | R/W | H'3FFF | H'FF3C |

Notes: 1. Lower 16 bits of the address.
2. Registers within the DTC cannot be read or written to directly.
3. Register information is located in on-chip RAM addresses H'F800 to H'FBFF. It cannot be located in external space. When the DTC is used, do not clear the RAME bit in SYSCR to 0.

### 7.2 Register Descriptions

### 7.2.1 DTC Mode Register A (MRA)

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | SM1 | SM0 | DM1 | DM0 | MD1 | MDO | DTS | Sz |
| Initial value: | Undefined | Undefined | Undefined | Undefined | Undefined | Undefined | Undefined | Undefined |
| R/W | - | - | - | - | - | - | - | - |

MRA is an 8-bit register that controls the DTC operating mode.

Bits 7 and 6-Source Address Mode 1 and 0 (SM1, SM0): These bits specify whether SAR is to be incremented, decremented, or left fixed after a data transfer.

| Bit 7 | Bit 6 |  |
| :--- | :--- | :--- |
| SM1 | SM0 | Description |
| 0 | - | SAR is fixed |
| 1 | 0 | SAR is incremented after a transfer <br> $(b y+1$ when $\mathrm{Sz}=0 ;$ by +2 when $\mathrm{Sz}=1)$ |
|  | 1 | SAR is decremented after a transfer <br> $(b y-1$ when $\mathrm{Sz}=0 ;$ by -2 when $\mathrm{Sz}=1)$ |

Bits 5 and 4-Destination Address Mode 1 and 0 (DM1, DM0): These bits specify whether DAR is to be incremented, decremented, or left fixed after a data transfer.

| Bit 5 | Bit 4 |  |
| :---: | :---: | :---: |
| DM1 | DM0 | Description |
| 0 | - | DAR is fixed |
| 1 | 0 | DAR is incremented after a transfer (by +1 when $\mathrm{Sz}=0$; by +2 when $\mathrm{Sz}=1$ ) |
|  | 1 | DAR is decremented after a transfer (by -1 when $\mathrm{Sz}=0$; by -2 when $\mathrm{Sz}=1$ ) |

Bits 3 and 2—DTC Mode (MD1, MD0): These bits specify the DTC transfer mode.

| Bit 3 | Bit $\mathbf{2}$ |  |
| :--- | :--- | :--- |
| MD1 | MD0 | Description |
| 0 | 0 | Normal mode |
| 1 | Repeat mode |  |
| 1 | 0 | Block transfer mode |
|  | 1 | - |

Bit 1—DTC Transfer Mode Select (DTS): Specifies whether the source side or the destination side is set to be a repeat area or block area, in repeat mode or block transfer mode.

## Bit 1

DTS Description

| 0 | Destination side is repeat area or block area |
| :--- | :--- |
| 1 | Source side is repeat area or block area |

Bit 0-DTC Data Transfer Size (Sz): Specifies the size of data to be transferred.
Bit 0

| Sz | Description |
| :--- | :--- |
| 0 | Byte-size transfer |
| 1 | Word-size transfer |

### 7.2.2 DTC Mode Register B (MRB)

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | CHNE | DISEL | - | - | - | - | - | - |
| Initial value: | Undefined | Undefined | Undefined | Undefined | Undefined | Undefined | Undefined | Undefined |
| R/W | - | - | - | - | - | - | - | - |

MRB is an 8-bit register that controls the DTC operating mode.
Bit 7—DTC Chain Transfer Enable (CHNE): Specifies chain transfer. With chain transfer, a number of data transfers can be performed consecutively in response to a single transfer request.

In data transfer with CHNE set to 1 , determination of the end of the specified number of transfers, clearing of the interrupt source flag, and clearing of DTCER is not performed.

Bit 7

| CHNE | Description |
| :--- | :--- |
| 0 | End of DTC data transfer (activation waiting state is entered) |
| 1 | DTC chain transfer (new register information is read, then data is transferred) |

Bit 6-DTC Interrupt Select (DISEL): Specifies whether interrupt requests to the CPU are disabled or enabled after a data transfer.

## Bit 6

DISEL Description
$0 \quad$ After a data transfer ends, the CPU interrupt is disabled unless the transfer counter is 0 (the DTC clears the interrupt source flag of the activating interrupt to 0)
1 After a data transfer ends, the CPU interrupt is enabled (the DTC does not clear the interrupt source flag of the activating interrupt to 0 )

Bits 5 to 0—Reserved: These bits have no effect on DTC operation, and should always be written with 0 in a write.

### 7.2.3 DTC Source Address Register (SAR)

| Bit | 23 | 22 | 21 | 20 | 19 | --- | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  |  |  |  |  | --- |  |  |  |  |  |
| Initial value: | Unde- Unde- Unde-Unde- Undefined fined fined fined fined |  |  |  |  | -- - | Unde- Unde-Unde- Unde-Undefined fined fined fined fined |  |  |  |  |
| R/W | - | - | - | - | - | -- - | - | - | - | - | - |

SAR is a 24-bit register that designates the source address of data to be transferred by the DTC.
For word-size transfer, specify an even source address.

### 7.2.4 DTC Destination Address Register (DAR)

| Bit | 23 | 22 | 21 | 20 | 19 | --- | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  |  |  |  |  | --- |  |  |  |  |  |
| Initial value: | Unde fined | Unde fined | Undefined | Unde fined | Unde fined | --- |  |  |  |  | Undefined |
| R/W | - | - | - | - | - |  | - | - | - | - | - |

DAR is a 24-bit register that designates the destination address of data to be transferred by the DTC. For word-size transfer, specify an even destination address.

### 7.2.5 DTC Transfer Count Register A (CRA)

Initial value: Unde- Unde-Unde-Unde-Unde-Unde-Unde-Unde-Unde-Unde-Unde-Unde-Unde-Unde- Unde-Undefined fined fined fined fined fined fined fined fined fined fined fined fined fined fined fined
R/W

CRA is a 16-bit register that designates the number of times data is to be transferred by the DTC.
In normal mode, the entire CRA functions as a 16-bit transfer counter ( 1 to 65536). It is decremented by 1 every time data is transferred, and transfer ends when the count reaches $\mathrm{H}^{\prime} 0000$.

In repeat mode or block transfer mode, the CRA is divided into two parts: the upper 8 bits (CRAH) and the lower 8 bits (CRAL). In repeat mode, CRAH holds the number of transfers while CRAL functions as an 8-bit transfer counter (1 to 256). In block transfer mode, CRAH holds the block size while CRAL functions as an 8-bit block size counter ( 1 to 256). CRAL is decremented by 1 every time data is transferred, and the contents of CRAH are sent when the count reaches $\mathrm{H}^{\prime} 00$. This operation is repeated.

### 7.2.6 DTC Transfer Count Register B (CRB)

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |

Initial value: Unde-Unde-Unde-Unde-Unde-Unde-Unde-Unde-Unde-Unde-Unde-Unde-Unde-Unde-Unde-Undefined fined fined fined fined fined fined fined fined fined fined fined fined fined fined fined
R/W : $\quad$ W $\quad-\quad-\quad-\quad-\quad-\quad-\quad-\quad-\quad-\quad-\quad-\quad-\quad-\quad-\quad-$
CRB is a 16-bit register that designates the number of times data is to be transferred by the DTC in block transfer mode. It functions as a 16-bit transfer counter ( 1 to 65536) that is decremented by 1 every time data is transferred, and transfer ends when the count reaches H'0000.

### 7.2.7 DTC Enable Registers (DTCER)

| Bit | $:$ | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | DTCE7 | DTCE6 | DTCE5 | DTCE4 | DTCE3 | DTCE2 | DTCE1 | DTCE0 |  |
|  | Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | $:$ | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

The DTC enable registers comprise six 8-bit readable/writable registers, DTCERA to DTCERF, with bits corresponding to the interrupt sources that can activate the DTC. These bits enable or disable DTC service for the corresponding interrupt sources.

The DTC enable registers are initialized to $\mathrm{H}^{\prime} 00$ by a reset and in hardware standby mode.

## Bit n-DTC Activation Enable (DTCEn)

## Bit $n$ <br> DTCEn Description

| 0 | DTC activation by this interrupt is disabled | (Initial value) |
| :--- | :--- | :--- |
|  | [Clearing conditions] |  |

1. When DISEL $=1$ and data transfer ends
2. When the specified number of transfers end

1 DTC activation by this interrupt is enabled
[Holding condition]
When DISEL $=0$ and the specified number of transfers have not ended
Note: $\mathrm{n}=7$ to 0

A DTCE bit can be set for each interrupt source that can activate the DTC. The correspondence between interrupt sources and DTCE bits is shown in table 7.3, together with the vector number generated for each interrupt controller.

For DTCE bit setting, use bit manipulation instructions such as BSET and BCLR. If all interrupts are masked, multiple activation sources can be set at one time by writing data after executing a dummy read on the relevant register.

### 7.2.8 DTC Vector Register (DTVECR)

| Bit | 7 |  | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | SWDTE | DTVEC6 | DTVEC5 | DTVEC4 | DTVEC3 | DTVEC2 | DTVEC1 | DTVECO |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | $\mathrm{R} /(\mathrm{W})^{* 1}$ | $\mathrm{R} /(\mathrm{W})^{* 2}$ | $\mathrm{R} /(\mathrm{W})^{* 2}$ | $\mathrm{R} /(\mathrm{W})^{* 2}$ | $\mathrm{R} /(\mathrm{W})^{* 2}$ | $\mathrm{R} /(\mathrm{W})^{* 2}$ | $\mathrm{R} /(\mathrm{W})^{* 2}$ | $\mathrm{R} /(\mathrm{W})^{* 2}$ |

Notes: 1. A value of 1 can only be written to the SWDTE bit.
2. DTVEC6 to DTVEC0 bits can only be written when $\operatorname{SWDTE}=0$.

DTVECR is an 8-bit readable/writable register that enables or disables DTC activation by software, and sets a vector number for the software activation interrupt.

DTVECR is initialized to $\mathrm{H}^{\prime} 00$ by a reset and in hardware standby mode.

Bit 7—DTC Software Activation Enable (SWDTE): Enables or disables DTC activation by software.

Bit 7

## SWDTE Description

$0 \quad$ DTC software activation is disabled
(Initial value)
[Clearing conditions]

1. When DISEL $=0$ and the specified number of transfers have not ended
2. When 0 is written to the DISEL bit after a software-activated data transfer end interrupt (SWDTEND) request has been sent to the CPU.
1 DTC software activation is enabled
[Holding conditions]
3. When DISEL $=1$ and data transfer ends
4. When the specified number of transfers end
5. During data transfer due to software activation

Bits 6 to 0—DTC Software Activation Vectors 6 to 0 (DTVEC6 to DTVEC0): These bits specify a vector number for DTC software activation.

The vector address is expressed as $\mathrm{H}^{\prime} 0400+(($ vector number $) \ll 1) . \ll 1$ indicates a one-bit leftshift. For example, when DTVEC6 to DTVEC0 $=\mathrm{H}^{\prime} 10$, the vector address is H'0420.

### 7.2.9 Module Stop Control Register (MSTPCR)

R/W : R/W R/W R/W R/W R/W R/W R/W R/W R/W R/W R/W R/W R/W R/W R/W R/W

MSTPCR is a 16-bit readable/writable register that performs module stop mode control.
When the MSTP14 bit in MSTPCR is set to 1 , the DTC operation stops at the end of the bus cycle and a transition is made to module stop mode. However, 1 cannot be written in the MSTP14 bit while the DTC is operating. For details, see section 18.5, Module Stop Mode.

MSTPCR is initialized to H'3FFF by a reset and in hardware standby mode. It is not initialized in software standby mode.

Bit 14—Module Stop (MSTP14): Specifies the DTC module stop mode.
Bit 14
MSTP14 Description

| 0 | DTC module stop mode cleared | (Initial value) |
| :--- | :--- | :--- |
| 1 | DTC module stop mode set |  |

### 7.3 Operation

### 7.3.1 Overview

When activated, the DTC reads register information that is already stored in memory and transfers data on the basis of that register information. After the data transfer, it writes updated register information back to memory. Pre-storage of register information in memory makes it possible to transfer data over any required number of channels. Setting the CHNE bit to 1 makes it possible to perform a number of transfers with a single activation.

Figure 7.2 shows a flowchart of DTC operation.

Note: * For details on interrupt handling, see the sections dealing with the individual peripheral modules.
Figure 7.2 Flowchart of DTC Operation
The DTC transfer mode can be normal mode, repeat mode, or block transfer mode.
The 24-bit SAR designates the DTC transfer source address and the 24-bit DAR designates the transfer destination address. After each transfer, SAR and DAR are independently incremented, decremented, or left fixed.

Table 7.2 outlines the functions of the DTC.
Table 7.2 DTC Functions

| Transfer Mode | Activation Source | Address Registers |  |
| :---: | :---: | :---: | :---: |
|  |  | Transfer Source | Transfer Destination |
| - Normal mode | - IRQ | 24 bits | 24 bits |
| - One transfer request transfers one | - TPU TGI |  |  |
| byte or one word | - 8-bit timer CMI |  |  |
| - Memory addresses are incremented | - SCI TXI or RXI |  |  |
| or decremented by 1 or 2 | - A/D converter ADI |  |  |
| - Up to 65,536 transfers possible | - Software |  |  |
| - Repeat mode |  |  |  |
| - One transfer request transfers one byte or one word |  |  |  |
| - Memory addresses are incremented or decremented by 1 or 2 |  |  |  |
| - After the specified number of transfers (1 to 256), the initial state resumes and operation continues |  |  |  |
| - Block transfer mode |  |  |  |
| - One transfer request transfers a block of the specified size |  |  |  |
| - Block size is from 1 to 256 bytes or words |  |  |  |
| - Up to 65,536 transfers possible |  |  |  |
| - A block area can be designated at either the source or destination |  |  |  |

### 7.3.2 Activation Sources

The DTC operates when activated by an interrupt or by a write to DTVECR by software. An interrupt request can be directed to the CPU or DTC, as designated by the corresponding DTCER bit. An interrupt becomes a DTC activation source when the corresponding bit is set to 1 , and a CPU interrupt source when the bit is cleared to 0 .

At the end of a data transfer (or the last consecutive transfer in the case of chain transfer), the activation source or corresponding DTCER bit is cleared. Table 7.3 shows activation source and

[^2]DTCER clearance. The activation source flag, in the case of RXIO, for example, is the RDRF flag of SCIO. As there are a number of activation sources, the activation source flag is not cleared with the last byte (or word) transfer. Take appropriate measures at each interrupt.

Table 7.3 Activation Source and DTCER Clearance
\(\left.$$
\begin{array}{lll} & \begin{array}{l}\text { When the DISEL Bit Is } \mathbf{0} \text { and } \\
\text { the Specified Number of }\end{array} & \begin{array}{l}\text { When the DISEL Bit Is 1, or when } \\
\text { the Specified Number of Transfers } \\
\text { Have Ended }\end{array} \\
\text { Activation Source } & \text { Transfers Have Not Ended }\end{array}
$$ \quad $$
\begin{array}{ll}\text { Software activation } & \text { The SWDTE bit is cleared to } 0\end{array}
$$ \begin{array}{l}The SWDTE bit remains set to 1 <br>

An interrupt request is issued to the CPU\end{array}\right]\)| Interrupt activation | The corresponding DTCER bit <br> remains set to 1 | The corresponding DTCER bit is cleared <br> to 0 |
| :--- | :--- | :--- |
|  | The activation source flag is <br> cleared to 0 | The activation source flag remains set to 1 <br> A request is issued to the CPU for the <br> activation source interrupt |

Figure 7.3 shows a block diagram of activation source control. For details see section 5, Interrupt Controller.

Figure 7.3 Block Diagram of DTC Activation Source Control

When an interrupt has been designated a DTC activation source, existing CPU mask level and interrupt controller priorities have no effect. If there is more than one activation source at the same time, the DTC operates in accordance with the default priorities.

### 7.3.3 DTC Vector Table

Figure 7.4 shows the correspondence between DTC vector addresses and register information.
Table 7.4 shows the correspondence between activation sources, vector addresses, and DTCER bits. When the DTC is activated by software, the vector address is obtained from: H'0400 + (DTVECR[6:0] << 1 ) (where << 1 indicates a 1-bit left shift). For example, if DTVECR is H'10, the vector address is $\mathrm{H}^{\prime} 0420$.

The DTC reads the start address of the register information from the vector address set for each activation source, and then reads the register information from that start address. The register information can be placed at predetermined addresses in the on-chip RAM. The start address of the register information should be an integral multiple of four.

The configuration of the vector address is the same in both normal and advanced modes, a 2-byte unit being used in both cases. These two bytes specify the lower bits of the address in the on-chip RAM.

Table 7.4 Interrupt Sources, DTC Vector Addresses, and Corresponding DTCEs

| Interrupt Source | Origin of Interrupt Source | Vector <br> Number | Vector <br> Address | DTCE* | Priority |
| :---: | :---: | :---: | :---: | :---: | :---: |
| Write to DTVECR | Software | DTVECR | $\begin{aligned} & \text { H'0400+ } \\ & \text { DTVECR } \\ & {[6: 0] \ll 1} \end{aligned}$ | - |  |
| IRQ0 | External pin | 16 | H'0420 | DTCEA7 |  |
| IRQ1 |  | 17 | H'0422 | DTCEA6 |  |
| IRQ2 |  | 18 | H'0424 | DTCEA5 |  |
| IRQ3 |  | 19 | H'0426 | DTCEA4 |  |
| IRQ4 |  | 20 | H'0428 | DTCEA3 |  |
| IRQ5 |  | 21 | H'042A | DTCEA2 |  |
| IRQ6 |  | 22 | H'042C | DTCEA1 |  |
| IRQ7 |  | 23 | H'042E | DTCEA0 |  |
| ADI (A/D conversion end) | A/D | 28 | H'0438 | DTCEB6 |  |

| TGIOB (GROB compare match/ input capture) |  | 33 | H'0442 | DTCEB4 |  |
| TGIOC (GROC compare match/ input capture) |  | 34 | H'0444 | DTCEB3 |  |
| TGIOD (GROD compare match/ input capture) |  | 35 | H'0446 | DTCEB2 |  |
| TGI1A (GR1A compare match/ input capture) | TPU channel 1 | 40 | H'0450 | DTCEB1 |  |
| TGI1B (GR1B compare match/ input capture) |  | 41 | H'0452 | DTCEB0 |  |
| TGI2A (GR2A compare match/ input capture) | TPU channel 2 | 44 | H'0458 | DTCEC7 |  |
| TGI2B (GR2B compare match/ input capture) |  | 45 | H'045A | DTCEC6 |  |

|  | Origin of <br> Interrupt <br> Source | Vector <br> Number | Vector <br> Address | DTCE* | Priority |
| :--- | :--- | :--- | :--- | :--- | :--- |
| CMIerrupt Source | 8-bit timer |  |  |  |  |
| channel 0 |  |  |  |  |  |

Note: * DTCE bits with no corresponding interrupt are reserved, and should be written with 0 .

Figure 7.4 Correspondence between DTC Vector Address and Register Information

### 7.3.4 Location of Register Information in Address Space

Figure 7.5 shows how the register information should be located in the address space.
Locate the MRA, SAR, MRB, DAR, CRA, and CRB registers, in that order, from the start address of the register information (contents of the vector address). In the case of chain transfer, register information should be located in consecutive areas.

Locate the register information in the on-chip RAM (addresses: H'FFF800 to H'FFFBFF).

Figure 7.5 Location of DTC Register Information in Address Space

### 7.3.5 Normal Mode

In normal mode, one operation transfers one byte or one word of data.
From 1 to 65,536 transfers can be specified. Once the specified number of transfers have ended, a CPU interrupt can be requested.

Table 7.5 lists the register information in normal mode and figure 7.6 shows memory mapping in normal mode.

Table 7.5 Register Information in Normal Mode

| Name | Abbreviation | Function |
| :--- | :--- | :--- |
| DTC source address register | SAR | Designates source address |
| DTC destination address register | DAR | Designates destination address |
| DTC transfer count register A | CRA | Designates transfer count |
| DTC transfer count register B | CRB | Not used |

Figure 7.6 Memory Mapping in Normal Mode

### 7.3.6 Repeat Mode

In repeat mode, one operation transfers one byte or one word of data.
From 1 to 256 transfers can be specified. Once the specified number of transfers have ended, the initial states of the transfer counter and the address register specified as the repeat area are restored, and transfer is repeated. In repeat mode the transfer counter value does not reach $\mathrm{H}^{\prime} 00$, and therefore CPU interrupts cannot be requested when DISEL $=0$.

Table 7.6 lists the register information in repeat mode and figure 7.7 shows memory mapping in repeat mode.

Table 7.6 Register Information in Repeat Mode

| Name | Abbreviation | Function |
| :--- | :--- | :--- |
| DTC source address register | SAR | Designates source address |
| DTC destination address register | DAR | Designates destination address |
| DTC transfer count register AH | CRAH | Holds number of transfers |
| DTC transfer count register AL | CRAL | Designates transfer count |
| DTC transfer count register B | CRB | Not used |

Figure 7.7 Memory Mapping in Repeat Mode

### 7.3.7 Block Transfer Mode

In block transfer mode, one operation transfers one block of data. A block area is specified for either the transfer source or the transfer destination.

The block size is 1 to 256 . When the transfer of one block ends, the initial state of the block size counter and the address register specified as the block area is restored. The other address register is then incremented, decremented, or left fixed.

From 1 to 65,536 transfers can be specified. Once the specified number of transfers have ended, a CPU interrupt is requested.

Table 7.7 lists the register information in block transfer mode and figure 7.8 shows memory mapping in block transfer mode.

Table 7.7 Register Information in Block Transfer Mode

| Name | Abbreviation | Function |
| :--- | :--- | :--- |
| DTC source address register | SAR | Designates source address |
| DTC destination address register | DAR | Designates destination address |
| DTC transfer count register AH | CRAH | Holds block size |
| DTC transfer count register AL | CRAL | Block size count |
| DTC transfer count register B | CRB | Transfer count |

Figure 7.8 Memory Mapping in Block Transfer Mode

### 7.3.8 Chain Transfer

Setting the CHNE bit to 1 enables a number of data transfers to be performed consecutively in response to a single transfer request. SAR, DAR, CRA, CRB, MRA, and MRB, which define data transfers, can be set independently.

Figure 7.9 shows the memory map for chain transfer. When activated, the DTC reads the register information start address stored at the vector address, which corresponds to the activation request, and then reads the first register information at that start address. After the data transfer, the CHNE bit will be tested. When it has been set to 1 , DTC reads the next register information located in a consecutive area and performs the data transfer. These sequences are repeated until the CHNE bit is cleared to 0 .

Figure 7.9 Chain Transfer Memory Map

In the case of transfer with CHNE set to 1 , an interrupt request to the CPU is not generated at the end of the specified number of transfers or by setting of the DISEL bit to 1 , and the interrupt source flag for the activation source is not affected.

### 7.3.9 Operation Timing

Figures 7.10, 7.11, and 7.12 show examples of DTC operation timings.

Figure 7.10 DTC Operation Timing (Example in Normal Mode or Repeat Mode)

Figure 7.11 DTC Operation Timing (Example of Block Transfer Mode, with Block Size of 2)

Figure 7.12 DTC Operation Timing (Example of Chain Transfer)

### 7.3.10 Number of DTC Execution States

Table 7.8 lists execution statuses for a single DTC data transfer, and table 7.9 shows the number of states required for each execution status.

Table 7.8 DTC Execution Statuses
$\left.\begin{array}{llllll} & \begin{array}{l}\text { Vector Read }\end{array} & \begin{array}{l}\text { Register Information } \\ \text { Read/Write } \\ \text { Jode }\end{array} & \mathbf{I} & 6 & \begin{array}{l}\text { Data Read } \\ \text { K }\end{array}\end{array} \begin{array}{l}\text { Data Write } \\ \mathbf{L}\end{array} \quad \begin{array}{l}\text { Internal } \\ \text { Operations } \\ \mathbf{M}\end{array}\right]$

Legend:
N : Block size (initial setting of CRAH and CRAL)

Table 7.9 Number of States Required for Each Execution Status

| Object to be Accessed |  |  | OnChip RAM | OnChip ROM | OnChip I/O Registers |  | External Devices |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Bus width |  |  | 32 | 16 | 8 | 16 | 8 |  | 16 |  |
| Access states |  |  | 1 | 1 | 2 | 2 | 2 | 3 | 2 | 3 |
| Execution status | Vector read | S | - | 1 | - | - | 4 | 6+2m | 2 | $3+\mathrm{m}$ |
|  | Register information read/write | S | 1 | - | - | - | - | - | - | - |
|  | Byte data read | $\mathrm{S}_{\mathrm{K}}$ | 1 | 1 | 2 | 2 | 2 | $3+\mathrm{m}$ | 2 | $3+\mathrm{m}$ |
|  | Word data read | $\mathrm{S}_{\mathrm{K}}$ | 1 | 1 | 4 | 2 | 4 | 6+2m | 2 | $3+\mathrm{m}$ |
|  | Byte data write | $\mathrm{S}_{\mathrm{L}}$ | 1 | 1 | 2 | 2 | 2 | 3+m | 2 | $3+\mathrm{m}$ |
|  | Word data write | $\mathrm{S}_{\mathrm{L}}$ | 1 | 1 | 4 | 2 | 4 | 6+2m | 2 | $3+\mathrm{m}$ |
|  | Internal operation | $\mathrm{S}_{\mathrm{M}}$ | 1 |  |  |  |  |  |  |  |

m : Number of wait states in external device access

The number of execution states is calculated from the formula below. Note that $\sum$ means the sum of all transfers activated by one activation event (the number in which the CHNE bit is set to 1 , plus 1).

Number of execution states $=\mathrm{I} \cdot \mathrm{S}_{\mathrm{I}}+\sum\left(\mathrm{J} \cdot \mathrm{S}_{\mathrm{J}}+\mathrm{K} \cdot \mathrm{S}_{\mathrm{K}}+\mathrm{L} \cdot \mathrm{S}_{\mathrm{L}}\right)+\mathrm{M} \cdot \mathrm{S}_{\mathrm{M}}$
For example, when the DTC vector address table is located in on-chip ROM, normal mode is set, and data is transferred from the on-chip ROM to an internal I/O register, the time required for the DTC operation is 13 states. The time from activation to the end of the data write is 10 states.

### 7.3.11 Procedures for Using DTC

## Activation by Interrupt

The procedure for using the DTC with interrupt activation is as follows:
[1] Set the MRA, MRB, SAR, DAR, CRA, and CRB register information in the on-chip RAM.
[2] Set the start address of the register information in the DTC vector address.
[3] Set the corresponding bit in DTCER to 1 .
[4] Set the enable bits for the interrupt sources to be used as the activation sources to 1 . The DTC is activated when an interrupt used as an activation source is generated.
[5] After the end of one data transfer, or after the specified number of data transfers have ended, the DTCE bit is cleared to 0 and a CPU interrupt is requested. If the DTC is to continue transferring data, set the DTCE bit to 1 .

## Activation by Software

The procedure for using the DTC with software activation is as follows:
[1] Set the MRA, MRB, SAR, DAR, CRA, and CRB register information in the on-chip RAM.
[2] Set the start address of the register information in the DTC vector address.
[3] Check that the SWDTE bit is 0 .
[4] Write 1 to SWDTE bit and the vector number to DTVECR.
[5] Check the vector number written to DTVECR.
[6] After the end of one data transfer, if the DISEL bit is 0 and a CPU interrupt is not requested, the SWDTE bit is cleared to 0 . If the DTC is to continue transferring data, set the SWDTE bit to 1 . When the DISEL bit is 1 , or after the specified number of data transfers have ended, the SWDTE bit is held at 1 and a CPU interrupt is requested.

### 7.3.12 Examples of Use of the DTC

## (1) Normal Mode

The first example shows how the DTC can be used to receive 128 bytes of data via the SCI.
[1] Set MRA to fixed source address $(S M 1=S M 0=0)$, incrementing destination address ( $\mathrm{DM} 1=$ $1, \mathrm{DM} 0=0)$, normal mode ( $\mathrm{MD} 1=\mathrm{MD} 0=0$ ), and byte size $(\mathrm{Sz}=0)$. The DTS bit can have any value. Set MRB for one data transfer by one interrupt $($ CHNE $=0$, DISEL $=0)$. Set the SCI RDR address in SAR, the start address of the RAM area where the data will be received in DAR, and 128 ( $\mathrm{H}^{\prime} 0080$ ) in CRA. CRB can be set to any value.
[2] Set the start address of the register information at the DTC vector address.
[3] Set the corresponding bit in DTCER to 1 .
[4] Set the SCI to the appropriate receive mode. Set the RIE bit in SCR to 1 to enable the reception complete (RXI) interrupt. Since the generation of a receive error during the SCI reception operation will disable subsequent reception, the CPU should be enabled to accept receive error interrupts.
[5] Each time reception of one byte of data ends on the SCI, the RDRF flag in SSR is set to 1, an RXI interrupt is generated, and the DTC is activated. The receive data is transferred from RDR to RAM by the DTC, and then DAR is incremented and CRA is decremented. The RDRF flag is automatically cleared to 0 .
[6] When CRA becomes 0 after the 128 data transfers have ended, the RDRF flag is held at 1 , the DTCE bit is cleared to 0 , and an RXI interrupt request is sent to the CPU. The interrupt handling routine should perform wrap-up processing.

## (2) Software Activation

The second example shows how the DTC can be used to transfer a block of 128 bytes of data by means of software activation. The transfer source address is $\mathrm{H}^{\prime} 1000$ and the destination address is $\mathrm{H}^{\prime} 2000$. The vector number is $\mathrm{H}^{\prime} 60$, so the vector address is $\mathrm{H}^{\prime} 04 \mathrm{C} 0$.
[1] Set MRA to incrementing source address ( $\mathrm{SM} 1=1, \mathrm{SM} 0=0$ ), incrementing destination address $(\mathrm{DM} 1=1, \mathrm{DM} 0=0)$, block transfer mode $(\mathrm{MD} 1=1, \mathrm{MD} 0=0)$, and byte size $(\mathrm{Sz}=$ 0 ). The DTS bit can have any value. Set MRB for one block transfer by one interrupt ( $\mathrm{CHNE}=$ $0)$. Set the transfer source address $\left(\mathrm{H}^{\prime} 1000\right)$ in SAR, the destination address $\left(\mathrm{H}^{\prime} 2000\right)$ in DAR, and 128 ( $\mathrm{H}^{\prime} 8080$ ) in CRA. Set 1 ( $\mathrm{H}^{\prime} 0001$ ) in CRB.
[2] Set the start address of the register information at the DTC vector address ( $\left.\mathrm{H}^{\prime} 04 \mathrm{C} 0\right)$.
[3] Check that the SWDTE bit in DTVECR is 0 . Check that there is currently no transfer activated by software.
[4] Write 1 to the SWDTE bit and the vector number (H'60) to DTVECR. The write data is H'E0.
[5] Read DTVECR again and check that it is set to the vector number (H'60). If it is not, this indicates that the write failed. This is presumably because an interrupt occurred between steps 3 and 4 and led to a different software activation. To activate this transfer, go back to step 3.
[6] If the write was successful, the DTC is activated and a block of 128 bytes of data is transferred.
[7] After the transfer, an SWDTEND interrupt occurs. The interrupt handling routine should clear the SWDTE bit to 0 and perform other wrap-up processing.

### 7.4 Interrupts

An interrupt request is issued to the CPU when the DTC finishes the specified number of data transfers, or a data transfer for which the DISEL bit was set to 1 . In the case of interrupt activation, the interrupt set as the activation source is generated. These interrupts to the CPU are subject to CPU mask level and interrupt controller priority level control.

In the case of activation by software, a software activated data transfer end interrupt (SWDTE $\mathrm{ND})$ is generated.

When one data transfer ends, or the specified number of data transfers end, with the DISEL bit set to 1 , after the end of the data transfer the SWDTE bit remains set to 1 and an SWDTEND interrupt is generated.

The interrupt handling routine should clear the SWDTE bit to 0 .

When the DTC is activated by software, an SWDTEND interrupt is not generated during a data transfer wait or during data transfer even if the SWDTE bit is set to 1 .

### 7.5 Usage Notes

Module Stop: When the MSTP14 bit in MSTPCR is set to 1 , the DTC clock stops, and the DTC enters the module stop state. However, 1 cannot be written in the MSTP14 bit while the DTC is operating. See section 18, Power-Down Modes, for details.

On-Chip RAM: The MRA, MRB, SAR, DAR, CRA, and CRB registers are all located in on-chip RAM. When the DTC is used, the RAME bit in SYSCR must not be cleared to 0 .

DTCE Bit Setting: For DTCE bit setting, use bit manipulation instructions such as BSET and BCLR. If all interrupts are masked, multiple activation sources can be set at one time by writing data after executing a dummy read on the relevant register.

## Section 8 I/O Ports

### 8.1 Overview

The H8S/2245 Group has 11 I/O ports (ports 1, 2, 3, 5, and A to G), and one input-only port (port 4).

Table 8.1 summarizes the port functions. The pins of each port also have other functions.
Each port includes a data direction register (DDR) that controls input/output (not provided for the input-only port), a data register (DR) that stores output data, and a port register (PORT) used to read the pin states.

Ports A to E have a built-in MOS input pull-up function, and in addition to DR and DDR, have a MOS input pull-up control register ( PCR ) to control the on/off state of MOS input pull-up.

Ports 3 and A include an open-drain control register (ODR) that controls the on/off state of the output buffer PMOS.

Ports 1 and A to F can drive a single TTL load and 90-pF capacitive load, and ports 2, 3, 5, and G can drive a single TTL load and $30-\mathrm{pF}$ capacitive load. All the I/O ports can drive a Darlington transistor when in output mode. Ports 1 , and A to C can drive an LED (10-mA sink current).

Port 2 and the interrupt input pins ( $\overline{\mathrm{IRQ} 0}$ to $\overline{\mathrm{IRQ} 7})$ are Schmitt-triggered inputs.

## Table 8.1 Port Functions

| Port | Description | Pins | Mode 1 Mode 2*1 ${ }^{\text {M }}$ Mode 3*1 | Mode 4 | Mode 5 | Mode 6* | Mode 7* ${ }^{*}$ |

### 8.2 Port 1

### 8.2.1 Overview

Port 1 is an 8 -bit I/O port. Port 1 pins also function as TPU I/O pins (TCLKA, TCLKB, TCLKC, TCLKD, TIOCA0, TIOCB0, TIOCC0, TIOCD0, TIOCA1, TIOCB1, TIOCA2, and TIOCB2) and an address bus output function. Port 1 pin functions change according to the operating mode.

Figure 8.1 shows the port 1 pin configuration.

Figure 8.1 Port 1 Pin Functions

### 8.2.2 Register Configuration

Table 8.2 shows the port 1 register configuration.
Table 8.2 Port 1 Registers

| Name | Abbreviation | R/W | Initial Value | Address* |
| :---: | :---: | :---: | :---: | :---: |
| Port 1 data direction register | P1DDR | W | H'00 | H'FEB0 |
| Port 1 data register | P1DR | R/W | H'00 | H'FF60 |
| Port 1 register | PORT1 | R | Undefined | H'FF50 |

Note: * Lower 16 bits of the address.

## Port 1 Data Direction Register (P1DDR)

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | P17DDR | P16DDR | P15DDR | P14DDR | P13DDR | P12DDR | P11DDR | P10DDR |
| Initial value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | w | w | w | w | w | w | w | w |

P1DDR is an 8-bit write-only register, the individual bits of which specify input or output for the pins of port 1. P1DDR cannot be read; if it is, an undefined value will be read.

This register is a write-only register, and cannot be written by bit manipulation instruction. For details, see section 2.10.4, Access Methods for Registers with Write-Only Bits.

P1DDR is initialized to $\mathrm{H}^{\prime} 00$ by a power-on reset, and in hardware standby mode. It retains its prior state after a manual reset, and in software standby mode. As the TPU is initialized by a manual reset, the pin states are determined by the P1DDR and P1DR specifications.

Whether the address output pins maintain their output state or go to the high-impedance state in a transition to software standby mode is selected by the OPE bit in SBYCR.

- Modes 1 to 3 and 7

The corresponding port 1 pins are output ports when P1DDR is set to 1 , and input ports when cleared to 0 .

Note: Modes 2, 3, and 7 cannot be used in the H8S/2240.

- Modes 4 to 6

The corresponding port 1 pins are address outputs when P13DDR to P10DDR are set to 1 , and input ports when cleared to 0 .
The corresponding port 1 pins are output ports when P17DDR to P14DDR are set to 1 , and input ports when cleared to 0 .

Note: Mode 6 cannot be used in the H8S/2240.

## Port 1 Data Register (P1DR)

| Bit | 7 | 6 | 5 | 43 |  | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | P17DR | P16DR | P15DR | P14DR | P13DR | P12DR | P11DR | P10DR |
| Initial value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

P 1 DR is an 8 -bit readable/writable register that stores output data for the port 1 pins $\left(\mathrm{P}_{7}\right.$ to $\left.\mathrm{P} 1_{0}\right)$.
P1DR is initialized to H'00 by a power-on reset, and in hardware standby mode. It retains its prior state after a manual reset, and in software standby mode.

## Port 1 Register (PORT1)

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | P17 | P16 | P15 | P14 | P13 | P12 | P11 | P10 |
| Initial value | * | -* | -* | —* | —* | -* | —* | —* |
| R/W | R | R | R | R | R | R | R | R |

Note: * Determined by state of pins P 17 to P 10 .

PORT1 is an 8-bit read-only register that shows the pin states. It cannot be written to. Writing of output data for the port 1 pins $\left(\mathrm{P} 1_{7}\right.$ to $\left.\mathrm{P}_{0}\right)$ must always be performed on P 1 DR .

If a port 1 read is performed while P1DDR bits are set to 1 , the P 1 DR values are read. If a port 1 read is performed while P1DDR bits are cleared to 0 , the pin states are read.

After a power-on reset and in hardware standby mode, PORT1 contents are determined by the pin states, as P1DDR and P1DR are initialized. PORT1 retains its prior state after a manual reset, and in software standby mode.

### 8.2.3 Pin Functions

Port 1 pins also function as TPU I/O pins (TCLKA, TCLKB, TCLKC, TCLKD, TIOCA0, TIOCB0, TIOCC0, TIOCD0, TIOCA1, TIOCB1, TIOCA2, and TIOCB2), and address output pins ( $\mathrm{A}_{23}$ to $\mathrm{A}_{20}$ ). Port 1 pin functions are shown in table 8.3.

Table 8.3 Port 1 Pin Functions
Pin Selection Method and Pin Functions

P1 ${ }_{7}$ /TIOCB2/
TCLKD

The pin function is switched as shown below according to the combination of the TPU channel 2 setting (by bits MD3 to MDO in TMDR2, bits IOB3 to IOB0 in TIOR2, and bits CCLR2 to CCLR0 in TCR2), bits TPSC2 to TPSC0 in TCRO, and bit P17DDR.

| TPU Channel 2 Setting | Table Below (1) | Table Below (2) |  |
| :---: | :---: | :---: | :---: |
| P17DDR | - | 0 | 1 |
| Pin function | TIOCB2 output | P 17 input | $\mathrm{P} 1{ }_{7}$ output |
|  |  | TIOCB2 input** |  |

### 8.3 Port 2

### 8.3.1 Overview

Port 2 is an 8-bit I/O port. Port 2 pins also function as 8-bit timer I/O pins (TMRI0, TMCI0, TMO0, TMRI1, TMCI1, and TMO1). Port 2 pin functions are the same in all operating modes. Port 2 uses Schmitt-triggered input.

Figure 8.2 shows the port 2 pin configuration.

Figure 8.2 Port 2 Pin Functions

### 8.3.2 Register Configuration

Table 8.4 shows the port 2 register configuration.
Table 8.4 Port 2 Registers

| Name | Abbreviation | R/W | Initial Value | Address* |
| :--- | :--- | :--- | :--- | :--- |
| Port 2 data direction register | P2DDR | W | H'00 $^{\prime}$ | H'FEB1 |
| Port 2 data register | P2DR | R/W | H'00 $^{\text {H'FF61 }}$ |  |
| Port 2 register | PORT2 | R | Undefined | H'FF51 |

Note: * Lower 16 bits of the address.

## Port 2 Data Direction Register (P2DDR)

| Bit | $:$ | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | P27DDR | P26DDR | P25DDR | P24DDR | P23DDR | P22DDR | P21DDR | P20DDR |
| Initial value | $:$ | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | $:$ | $W$ | $W$ | $W$ | $W$ | $W$ | $W$ | $W$ | W |

P2DDR is an 8-bit write-only register, the individual bits of which specify input or output for the pins of port 2. P2DDR cannot be read; if it is, an undefined value will be read.

Setting a P2DDR bit to 1 makes the corresponding port 2 pin an output pin, while clearing the bit to 0 makes the pin an input pin.

This register is a write-only register, and cannot be written by bit manipulation instruction. For details, see section 2.10.4, Access Methods for Registers with Write-Only Bits.

P2DDR is initialized to $\mathrm{H}^{\prime} 00$ by a power-on reset, and in hardware standby mode. It retains its prior state after a manual reset, and in software standby mode. As the 8 -bit timer is initialized by a manual reset, the pin states are determined by the P2DDR and P2DR specifications.

## Port 2 Data Register (P2DR)

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | P27DR | P26DR | P25DR | P24DR | P23DR | P22DR | P21DR | P20DR |
| Initial value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

P 2 DR is an 8-bit readable/writable register that stores output data for the port 2 pins $\left(\mathrm{P} 2_{7}\right.$ to $\left.\mathrm{P} 2_{0}\right)$.
P2DR is initialized to $\mathrm{H}^{\prime} 00$ by a power-on reset, and in hardware standby mode. It retains its prior state after a manual reset, and in software standby mode.

## Port 2 Register (PORT2)

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | P27 | P26 | P25 | P24 | P23 | P22 | P21 | P20 |
| Initial value | —* | —* | —* | —* | —* | —* | —* | —* |
| R/W | R | R | R | R | R | R | R | R |

Note: * Determined by state of pins $\mathrm{P} 2_{7}$ to $\mathrm{P} 2_{0}$.

PORT2 is an 8-bit read-only register that shows the pin states. It cannot be written to. Writing of output data for the port 2 pins $\left(\mathrm{P} 2_{7}\right.$ to $\left.\mathrm{P} 2_{0}\right)$ must always be performed on P 2 DR .

If a port 2 read is performed while P 2 DDR bits are set to 1 , the P 2 DR values are read. If a port 2 read is performed while P2DDR bits are cleared to 0 , the pin states are read.

After a power-on reset and in hardware standby mode, PORT2 contents are determined by the pin states, as P2DDR and P2DR are initialized. PORT2 retains its prior state after a manual reset, and in software standby mode.

### 8.3.3 Pin Functions

Port 2 pins also function as 8-bit timer I/O pins (TMRI0, TMCI0, TMO0, TMRI1, TMCI1, and TMO1). Port 2 pin functions are shown in table 8.5.

Table 8.5 Port 2 Pin Functions
Pin Selection Method and Pin Functions
P2/TMO1
The pin function is switched as shown below according to the combination of the bits OS3 to OS0 in TCSR1 of the 8-bit timer, and bit P27DDR.

| OS3 to OS0 | All 0 |  | Any 1 |
| :--- | :---: | :---: | :---: |

| :--- | :---: | :---: |
| Pin function | $\mathrm{P}_{2}$ input | $\mathrm{P}_{0}$ output |

### 8.4 Port 3

### 8.4.1 Overview

Port 3 is a 6-bit I/O port. Port 3 pins also function as SCI I/O pins (TxD0, RxD0, SCK0, TxD1, RxD1, and SCK1) and interrupt input pins ( $\overline{\mathrm{IRQ}} 4, \overline{\mathrm{IRQ} 5}$ ). Port 3 pin functions are the same in all operating modes. The interrupt input pins ( $\overline{\mathrm{IRQ} 4}, \overline{\mathrm{IRQ} 5})$ are Schmitt-triggered inputs.

Figure 8.3 shows the port 3 pin configuration.

Figure 8.3 Port 3 Pin Functions

### 8.4.2 Register Configuration

Table 8.6 shows the port 3 register configuration.

## Table 8.6 Port 3 Registers

| Name | Abbreviation | R/W | Initial Value* ${ }^{1}$ | Address* ${ }^{2}$ |
| :---: | :---: | :---: | :---: | :---: |
| Port 3 data direction register | P3DDR | W | H'00 | H'FEB2 |
| Port 3 data register | P3DR | R/W | H'00 | H'FF62 |
| Port 3 register | PORT3 | R | Undefined | H'FF52 |
| Port 3 open drain control register | P3ODR | R/W | H'00 | H'FF76 |

Notes: 1. Value of bits 5 to 0.
2. Lower 16 bits of the address.

## Port 3 Data Direction Register (P3DDR)

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | P35DDR | P34DDR | P33DDR | P32DDR | P31DDR | P30DDR |
| Initial value | Undefined | Indefined | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | - | - | w | w | W | W | w | W |

P3DDR is an 8-bit write-only register, the individual bits of which specify input or output for the pins of port 3. Bits 7 and 6 are reserved. P3DDR cannot be read; if it is, an undefined value will be read. P3DDR cannot be modified.

Setting a P3DDR bit to 1 makes the corresponding port 3 pin an output pin, while clearing the bit to 0 makes the pin an input pin.

This register is a write-only register, and cannot be written by bit manipulation instruction. For details, see section 2.10.4, Access Methods for Registers with Write-Only Bits.

P3DDR is initialized to $\mathrm{H}^{\prime} 00$ (bits 5 to 0 ) by a power-on reset, and in hardware standby mode. It retains its prior state after a manual reset, and in software standby mode. As the SCI is initialized by a reset and in standby mode, the pin states are determined by the P3DDR and P3DR specifications.

## Port 3 Data Register (P3DR)

| Bit | $:$ | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | P35DR | P34DR | P33DR | P32DR | P31DR | P30DR |  |
|  |  | - | - | 0 | 0 | 0 | 0 |  |  |
| Initial value : | Undefined | Undefined | 0 | 0 | 0 | 0 |  |  |  |
| R/W | $:$ | - | - | R/W | R/W | R/W | R/W | R/W | R/W |

P3DR is an 8-bit readable/writable register that stores output data for the port 3 pins $\left(\mathrm{P}_{5}\right.$ to $\left.\mathrm{P}_{0}\right)$.
Bits 7 and 6 are reserved; they return an undetermined value if read, and cannot be modified.
P3DR is initialized to $\mathrm{H}^{\prime} 00$ (bits 5 to 0 ) by a power-on reset, and in hardware standby mode. It retains its prior state after a manual reset, and in software standby mode.

## Port 3 Register (PORT3)

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | P35 | P34 | P33 | P32 | P31 | P30 |
| Initial value | Undefined Undefined |  | -* | -* | -* | 一* | -* | * |
| R/W | - | - | R | R | R | R | R | R |

Note: * Determined by state of pins P 35 to $\mathrm{P} 3_{0}$.

PORT3 is an 8-bit read-only register that shows the pin states. Writing of output data for the port 3 pins ( $\mathrm{P} 3_{5}$ to $\mathrm{P}_{0}$ ) must always be performed on P3DR.

Bits 7 and 6 are reserved; they return an undetermined value if read, and cannot be modified.
If a port 3 read is performed while P3DDR bits are set to 1 , the P3DR values are read. If a port 3 read is performed while P3DDR bits are cleared to 0 , the pin states are read.

After a power-on reset and in hardware standby mode, PORT3 contents are determined by the pin states, as P3DDR and P3DR are initialized. PORT3 retains its prior state after a manual reset, and in software standby mode.

## Port 3 Open Drain Control Register (P3ODR)

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | P35ODR | P34ODR | P33ODR | P320DR | P310DR | P300DR |
| Initial value | Undefined | Undefined | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | - | - | R/w | R/W | R/W | R/W | R/W | R/W |

P3ODR is an 8-bit readable/writable register that controls the PMOS on/off status for each port 3 pin $\left(\mathrm{P}_{5}\right.$ to $\left.\mathrm{P} 3_{0}\right)$.

Bits 7 and 6 are reserved; they return an undetermined value if read, and cannot be modified.
Setting a P3ODR bit to 1 makes the corresponding port 3 pin an NMOS open-drain output pin, while clearing the bit to 0 makes the pin a CMOS output pin.

P3ODR is initialized to $\mathrm{H}^{\prime} 00$ (bits 5 to 0 ) by a power-on reset, and in hardware standby mode. It retains its prior state after a manual reset, and in software standby mode.

### 8.4.3 Pin Functions

Port 3 pins also function as SCI I/O pins (TxD0, RxD0, SCK0, TxD1, RxD1, and SCK1) and interrupt input pins ( $\overline{\mathrm{IRQ} 4}, \overline{\mathrm{IRQ} 5})$. Port 3 pin functions are shown in table 8.7.

Table 8.7 Port 3 Pin Functions
Pin Selection Method and Pin Functions
$\mathrm{P}_{5} / \mathrm{SCK} 1 / \overline{\mathrm{RQ}} 5$
The pin function is switched as shown below according to the combination of bit C/A in the SCI1 SMR, bits CKE0 and CKE1 in SCR, and bit P35DDR.

| CKE1 | 0 |  |  |  | 1 |
| :--- | :---: | :---: | :---: | :---: | :---: |
| C//̄ | 0 |  |  | 1 | - |
| CKE0 | 0 |  | - |  |  |
| P35DDR | 0 | 1 | - | - | - |
| Pin function | $\mathrm{P3}_{5}$ <br> input pin | $\mathrm{P3}_{5}$ <br> output pin*' | SCK1 <br> Sutput pin*' | SCK1 <br> output pin*' | SCK1 <br> input pin |
|  | $\overline{\text { RQ5 }}$ interrupt input pin*² |  |  |  |  |

Notes: 1. When P35ODR = 1, the pin becomes on NMOS open-drain output.
2. When this pin is used as an external interrupt input, it should not be used as an input/output pin with other functions.
$\mathrm{P}_{4} /$ SCK0/IRQ4
The pin function is switched as shown below according to the combination of bit C/A in the SCIO SMR, bits CKE0 and CKE1 in SCR, and bit P34DDR.

| CKE1 | 0 |  |  |  | 1 |
| :---: | :---: | :---: | :---: | :---: | :---: |
| C/A | 0 |  |  | 1 | - |
| CKE0 | 0 |  | 1 | - | - |
| P34DDR | 0 | 1 | - | - | - |
| Pin function | $\begin{gathered} \mathrm{P3}_{4} \\ \text { input pin } \end{gathered}$ | $\mathrm{P}_{4}$ output pin* | SCKO output pin* | SCKO output pin*1 | SCKO input pin |
|  |  |  |  |  |  |

Notes: 1. When P34ODR = 1, the pin becomes an NMOS open-drain output.
2. When this pin is used as an external interrupt input, it should not be used as an input/output pin with other functions.

| Pin | Selection Method and Pin Functions |  |  |  |
| :---: | :---: | :---: | :---: | :---: |
| $\mathrm{P}_{3} / \mathrm{RxD} 1$ | The pin function is switched as shown below according to the combination of bit RE in the SCI1 SCR, and bit P33DDR. |  |  |  |
|  | RE | 0 |  | 1 |
|  | P33DDR | 0 | 1 | - |
|  | Pin function | $\mathrm{P} 33^{\text {input pin }}$ | P3 ${ }_{3}$ output pin* | RxD1 input pin |
|  | Note: * When P33ODR = 1, the pin becomes an NMOS open drain output. |  |  |  |
| $\overline{\mathrm{P} 3 / \mathrm{RxD} 0}$ | The pin function is switched as shown below according to the combination of bit RE in the SCIO SCR, and bit P32DDR. |  |  |  |
|  | RE | 0 |  | 1 |

|  | Pin function | P3 input pin | P3 ${ }_{0}$ output pin* | TxD0 output pin* |
|  | Note: * W | 300DR = 1, th | becomes an NN | open drain output. |

### 8.5 Port 4

### 8.5.1 Overview

Port 4 is an 8-bit input-only port. Port 4 pins also function as A/D converter analog input pins (AN0 to AN3). Port 4 pin functions are the same in all operating modes. Figure 8.4 shows the port 4 pin configuration.

Figure 8.4 Port 4 Pin Functions

### 8.5.2 Register Configuration

Table 8.8 shows the port 4 register configuration. Port 4 is an input-only port, and does not have a data direction register or data register.

Table 8.8 Port 4 Registers

| Name | Abbreviation | R/W | Initial Value | Address* |
| :--- | :--- | :--- | :--- | :--- |
| Port 4 register | PORT4 | R | Undefined | H'FF53 |

Note: * Lower 16 bits of the address.

## Port 4 Register (PORT4)

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | - | P43 | P42 | P41 | P40 |
| Initial value | Undefined Undefined Undefined Undefined |  |  |  | -* | -* | -* | -* |
| R/W | - | - | - | - | R | R | R | R |

Note: * Determined by state of pins P 43 to P 40 .

PORT4 is an 8 -bit read-only register that shows port 4 pin states. PORT4 cannot be modified.
Bits 7 to 4 are reserved; they return an undetermined value if read.

### 8.5.3 Pin Functions

Port 4 pins also function as A/D converter analog input pins (AN0 to AN3).

### 8.6 Port 5

### 8.6.1 Overview

Port 5 is a 4-bit I/O port. Port 5 pins also function as SCI I/O pins (TxD2, RxD2, and SCK2). Port 5 pin functions are the same in all operating modes. Figure 8.5 shows the port 5 pin configuration.

Figure 8.5 Port 5 Pin Functions

### 8.6.2 Register Configuration

Table 8.9 shows the port 5 register configuration.
Table 8.9 Port 5 Registers

| Name | Abbreviation | R/W | Initial Value* ${ }^{1}$ | Address* $^{{ }^{2}}$ |
| :--- | :--- | :--- | :--- | :--- |
| Port 5 data direction register | P5DDR | W | H'0 | H'FEB4 |
| Port 5 data register | P5DR | R/W | H'0 | H'FF64 |
| Port 5 register | PORT5 | R | Undefined | H'FF54 |

Notes: 1. Value of bits 3 to 0.
2. Lower 16 bits of the address.

## Port 5 Data Direction Register (P5DDR)

| Bit | $:$ | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |  |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | - | - | - | - | P53DDR | P52DDR | P51DDR | P50DDR |  |
|  | Initial value | $:$ |  | Undefined | Undefined | Undefined | Undefined | 0 | 0 | 0 |
| 0 |  |  |  |  |  |  |  |  |  |  |
| R/W | $:$ | - | - | - | - | W | W | W | W |  |

P5DDR is an 8-bit write-only register, the individual bits of which specify input or output for the pins of port 5. Bits 7 to 4 are reserved. P5DDR cannot be read; if it is, an undefined value will be read. P5DDR cannot be modified.

Setting a P5DDR bit to 1 makes the corresponding port 5 pin an output pin, while clearing the bit to 0 makes the pin an input pin.

This register is a write-only register, and cannot be written by bit manipulation instruction. For details, see section 2.10.4, Access Methods for Registers with Write-Only Bits.

P5DDR is initialized to $\mathrm{H}^{\prime} 0$ (bits 3 to 0 ) by a power-on reset, and in hardware standby mode. It retains its prior state after a manual reset, and in software standby mode. As the SCI is initialized by a reset and in standby mode, the pin states are determined by the P5DDR and P5DR specifications.

## Port 5 Data Register (P5DR)

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | - | P53DR | P52DR | P51DR | P50DR |
| Initial value | Undefined Undefined Undefined Undefined |  |  |  | 0 | 0 | 0 | 0 |
| R/W | - | - | - | - | R/W | R/W | R/W | R/W |

P5DR is an 8-bit readable/writable register that stores output data for the port 5 pins $\left(\mathrm{P5}_{3}\right.$ to $\left.\mathrm{P5}_{0}\right)$.
Bits 7 to 4 are reserved; they return an undetermined value if read, and cannot be modified.
P5DR is initialized to $\mathrm{H}^{\prime} 0$ (bits 3 to 0 ) by a power-on reset, and in hardware standby mode. It retains its prior state after a manual reset, and in software standby mode.

## Port 5 Register (PORT5)

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | - | P53 | P52 | P51 | P50 |
| Initial value | Undefined Undefined Undefined Undefined |  |  |  | -* | —* | —* | -* |
| R/W | - | - | - | - | R | R | R | R |

Note: * Determined by state of pins $\mathrm{P}_{3}$ to P 50 .

PORT5 is an 8-bit read-only register that shows the pin states. It cannot be written to. Writing of output data for the port 5 pins $\left(\mathrm{P}_{3}\right.$ to $\left.\mathrm{P5}_{0}\right)$ must always be performed on P5DR.

Bits 7 to 4 are reserved; they return an undetermined value if read, and cannot be modified.

If a port 5 read is performed while P5DDR bits are set to 1 , the P5DR values are read. If a port 5 read is performed while P5DDR bits are cleared to 0 , the pin states are read.

After a power-on reset and in hardware standby mode, PORT5 contents are determined by the pin states, as P5DDR and P5DR are initialized. PORT5 retains its prior state after a manual reset, and in software standby mode.

### 8.6.3 Pin Functions

Port 5 pins also function as SCI I/O pins (TxD2, RxD2, and SCK2). Port 5 pin functions are shown in table 8.10.

## Table 8.10 Port 5 Pin Functions

Pin Selection Method and Pin Functions
$\mathrm{P}_{3}$
The pin function is switched as shown below according to bit P53DDR.

| P53DDR | 0 | 1 |
| :--- | :---: | :---: |
| Pin function | $\mathrm{P5}_{3}$ input pin | $\mathrm{P5}_{3}$ output pin |

P5//SCK2
The pin function is switched as shown below according to the combination of bit C//̄ in the SCI2 SMR, bits CKE0 and CKE1 in SCR, and bit P52DDR.

| CKE1 | 0 |  |  |  | 1 |
| :--- | :---: | :---: | :---: | :---: | :---: |
| C// | 0 |  |  | 1 | - |
| CKE0 | 0 |  | - |  |  |
| P52DDR | 0 | 1 | - | - | - |
| Pin function | $\mathrm{P5}_{2}$ <br> input pin | $\mathrm{P} 5_{2}$ <br> output pin | SCK2 <br> output pin | SCK2 <br> output pin | SCK2 <br> input pin |

$\overline{P 5, / R x D 2}$
The pin function is switched as shown below according to the combination of bit RE in the SCI2 SCR, and bit P51DDR.

| RE | 0 |  | 1 |
| :--- | :---: | :---: | :---: |
| P51DDR | 0 | 1 | - |
| Pin function | P5, input pin | P5, output pin | RxD2 input pin |

$\overline{P 5} / \mathrm{TxD2}$
The pin function is switched as shown below according to the combination of bit TE in the SCI2 SCR, and bit P50DDR.

| TE | 0 |  | 1 |
| :--- | :---: | :---: | :---: |
| P50DDR | 0 | 1 | - |
| Pin function | P5 input pin | $\mathrm{P} 5_{0}$ output pin | TxD2 output pin |

### 8.7 Port A

### 8.7.1 Overview

Port A is an 4-bit I/O port. Port A pins also function as address bus outputs. The pin functions change according to the operating mode.

Port A has a built-in MOS input pull-up function that can be controlled by software.

Figure 8.6 shows the port A pin configuration.

Figure 8.6 Port A Pin Functions

### 8.7.2 Register Configuration

Table 8.11 shows the port A register configuration.

Table 8.11 Port A Registers

| Name | Abbreviation | R/W | Initial Value*' | Address* ${ }^{2}$ |
| :---: | :---: | :---: | :---: | :---: |
| Port A data direction register | PADDR | W | H'0 | H'FEB9 |
| Port A data register | PADR | R/W | $\mathrm{H}^{\prime}$ | H'FF69 |
| Port A register | PORTA | R | Undefined | H'FF59 |
| Port A MOS pull-up control register | PAPCR | R/W | H'0 | H'FF70 |
| Port A open-drain control register | PAODR | R/W | $\mathrm{H}^{\prime} \mathrm{O}$ | H'FF77 |

Notes: 1. Value of bits 3 to 0 .
2. Lower 16 bits of the address.

## Port A Data Direction Register (PADDR)

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | - | PA3DDR | PA2DDR | PA1DDR | PAODDR |
| Initial value | Undefined Undefined Undefined Undefined |  |  |  | 0 | 0 | 0 | 0 |
| R/W | - | - | - | - | W | W | W | W |

PADDR is an 8-bit write-only register, the individual bits of which specify input or output for the pins of port A. Bits 7 to 4 are reserved. PADDR cannot be read; if it is, an undefined value will be read. PADDR cannot be modified.

This register is a write-only register, and cannot be written by bit manipulation instruction. For details, see section 2.10.4, Access Methods for Registers with Write-Only Bits.

PADDR is initialized to $\mathrm{H}^{\prime} 0$ (bits 3 to 0 ) by a power-on reset and in hardware standby mode. It retains its prior state after a manual reset, and in software standby mode. The OPE bit in SBYCR is used to select whether the address output pins retain their output state or become highimpedance when a transition is made to software standby mode.

- Modes 1, 2, 3, and 7

Setting a PADDR bit to 1 makes the corresponding port A pin an output port, while clearing the bit to 0 makes the pin an input port.

Note: Modes 2, 3, and 7 cannot be used in the H8S/2240.

- Modes 4 and 5

The corresponding port A pins are address outputs irrespective of the value of bits PA3DDR to PA0DDR.

- Mode 6

Setting a PADDR bit to 1 makes the corresponding port A pin an address output while clearing the bit to 0 makes the pin an input port.

Note: Mode 6 cannot be used in the H8S/2240.

## Port A Data Register (PADR)

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | - | PA3DR | PA2DR | PA1DR | PAODR |
| Initial value | Undefined Undefined Undefined Undefined |  |  |  | 0 | 0 | 0 | 0 |
| R/W | - | - | - | - | R/W | R/W | R/W | R/W |

PADR is an 8-bit readable/writable register that stores output data for the port A pins $\left(\mathrm{PA}_{3}\right.$ to $\left.\mathrm{PA}_{0}\right)$.
Bits 7 to 4 are reserved; they return an undetermined value if read, and cannot be modified.
PADR is initialized to $\mathrm{H}^{\prime} 0$ (bits 3 to 0 ) by a power-on reset, and in hardware standby mode. It retains its prior state after a manual reset, and in software standby mode.

## Port A Register (PORTA)

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | - | PA3 | PA2 | PA1 | PAO |
| Initial value | Undefined Undefined Undefined Undefined |  |  |  | —* | —* | —* | —* |
| R/W | - | - | - | - | R | R | R | R |

Note: * Determined by state of pins $\mathrm{PA}_{3}$ to $\mathrm{PA}_{0}$.

PORTA is an 8-bit read-only register that shows the pin states. It cannot be written to. Writing of output data for the port A pins $\left(\mathrm{PA}_{3}\right.$ to $\left.\mathrm{PA}_{0}\right)$ must always be performed on PADR.

Bits 7 to 4 are reserved; they return an undetermined value if read, and cannot be modified.
If a port A read is performed while PADDR bits are set to 1 , the PADR values are read. If a port A read is performed while PADDR bits are cleared to 0 , the pin states are read.

After a power-on reset and in hardware standby mode, PORTA contents are determined by the pin states, as PADDR and PADR are initialized. PORTA retains its prior state after a manual reset, and in software standby mode.

## Port A MOS Pull-Up Control Register (PAPCR)

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | - | PA3PCR | PA2PCR | PA1PCR | PAOPCR |
| Initial value | Undefin | defir | defin | defin | 0 | 0 | 0 | 0 |
| R/W | - | - | - | - | R/W | R/W | R/W | R/W |

PAPCR is an 8-bit readable/writable register that controls the MOS input pull-up function incorporated into port A on an individual bit basis.

Bits 7 to 4 are reserved; they return an undetermined value if read, and cannot be modified.
Bits 3 to 0 are valid in modes $1,2,3,6$, and 7 , and all the bits are invalid in modes 4 and 5 . When a PADDR bit is cleared to 0 (input port setting), setting the corresponding PAPCR bit to 1 turns on the MOS input pull-up for the corresponding pin.

PAPCR is initialized to $\mathrm{H}^{\prime} 0$ (bits 3 to 0 ) by a power-on reset, and in hardware standby mode. It retains its prior state after a manual reset, and in software standby mode.

## Port A Open Drain Control Register (PAODR)

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | - | PA3ODR | PA2ODR | PA1ODR | PA0ODR |
| Initial value | Undefin | defin | defin | defin | 0 | 0 | 0 | 0 |
| R/W | - | - | - | - | R/W | R/W | R/W | R/W |

PAODR is an 8-bit readable/writable register that controls whether PMOS is on or off for each port A pin $\left(\mathrm{PA}_{3}\right.$ to $\left.\mathrm{PA}_{0}\right)$.

Bits 7 to 4 are reserved; they return an undetermined value if read, and cannot be modified.
All bits are valid in modes $1,2,3$, and 7 .
Setting a PAODR bit to 1 makes the corresponding port A pin an NMOS open-drain output, while clearing the bit to 0 makes the pin a CMOS output.

PAODR is initialized to $\mathrm{H}^{\prime} 0$ (bits 3 to 0 ) by a power-on reset, and in hardware standby mode. It retains its prior state after a manual reset, and in software standby mode.

### 8.7.3 Pin Functions

## Modes 1, 2, 3 and 7

In mode $1,2,3$, and 7 , port A pins function as I/O ports. Input or output can be specified for each pin on an individual bit basis. Setting a PADDR bit to 1 makes the corresponding port A pin an output port, while clearing the bit to 0 makes the pin an input port.

Note: Modes 2, 3, and 7 cannot be used in the H8S/2240.
Port A pin functions in modes $1,2,3$, and 7 are shown in figure 8.7.

Figure 8.7 Port A Pin Functions (Modes 1, 2, 3, and 7)

## Modes 4 and 5

In modes 4 and 5, the lower 4 bits of port A are designated as address outputs automatically.
Port A pin functions in modes 4 and 5 are shown in figure 8.8.

Figure 8.8 Port A Pin Functions (Modes 4 and 5)

## Mode 6

In mode 6, port A pins function as address outputs or input ports. Input or output can be specified on an individual bit basis. Setting a PADDR bit to 1 makes the corresponding port A pin an address output, while clearing the bit to 0 makes the pin an input port.

Note: Mode 6 cannot be used in the H8S/2240.
Port A pin functions in mode 6 are shown in figure 8.9.

Figure 8.9 Port A Pin Functions (Mode 6)

### 8.7.4 MOS Input Pull-Up Function

Port A has a built-in MOS input pull-up function that can be controlled by software. This MOS input pull-up function can be used in modes $1,2,3,6$, and 7 , and cannot be used in modes 4 and 5. MOS input pull-up can be specified as on or off on an individual bit basis.

When a PADDR bit is cleared to 0 , setting the corresponding PAPCR bit to 1 turns on the MOS input pull-up for that pin.

The MOS input pull-up function is in the off state after a power-on reset, and in hardware standby mode. The prior state is retained after a manual reset, and in software standby mode.

Note: Modes 2, 3, 6, and 7 cannot be used in the H8S/2240.
Table 8.12 summarizes the MOS input pull-up states.
Table 8.12 MOS Input Pull-Up States (Port A)
$\left.\begin{array}{llllll}\text { Modes } & & \begin{array}{l}\text { Power-On } \\ \text { Reset }\end{array} & \begin{array}{l}\text { Hardware } \\ \text { Standby Mode }\end{array} & \begin{array}{l}\text { Manual } \\ \text { Reset }\end{array} & \begin{array}{l}\text { Software } \\ \text { Standby Mode }\end{array}\end{array} \begin{array}{l}\text { In Other } \\ \text { Operations }\end{array}\right]$

Legend:
OFF: MOS input pull-up is always off.
ON/OFF: On when PADDR $=0$ and $\operatorname{PAPCR}=1$; otherwise off.

### 8.8 Port B

### 8.8.1 Overview

Port B is an 8-bit I/O port. Port B has an address bus output function, and the pin functions change according to the operating mode.

Port B has a built-in MOS input pull-up function that can be controlled by software.
Figure 8.10 shows the port B pin configuration.

|  | Pin functions in modes 1, 4, and 5 <br> $\mathrm{A}_{15}$ (output) <br> $\mathrm{A}_{14}$ (output) <br> $\mathrm{A}_{13}$ (output) <br> $\mathrm{A}_{12}$ (output) <br> $\mathrm{A}_{11}$ (output) <br> $\mathrm{A}_{10}$ (output) <br> $\mathrm{A}_{9}$ (output) <br> $\mathrm{A}_{8}$ (output) |
| :---: | :---: |
| Pin functions in modes 2 and 6* | Pin functions in modes 3 and 7* |
| $\mathrm{PB}_{7}$ (input)/ $\mathrm{A}_{15}$ (output) | $\mathrm{PB}_{7}(\mathrm{l} / \mathrm{O})$ |
| $\mathrm{PB}_{6}$ (input)/ $\mathrm{A}_{14}$ (output) | $\mathrm{PB}_{6}(1 / 0)$ |
| $\mathrm{PB}_{5}$ (input)/ $/ \mathrm{A}_{13}$ (output) | $\mathrm{PB}_{5}(1 / 0)$ |
| $\mathrm{PB}_{4}$ (input)/ $\mathrm{A}_{12}$ (output) | $\mathrm{PB}_{4}(1 / 0)$ |
| $\mathrm{PB}_{3}$ (input)/ $/ \mathrm{A}_{11}$ (output) | $\mathrm{PB}_{3}(1 / 0)$ |
| $\mathrm{PB}_{2}$ (input)/ $\mathrm{A}_{10}$ (output) | $\mathrm{PB}_{2}(1 / 0)$ |
| $\mathrm{PB}_{1}$ (input)/ $\mathrm{A}_{9}$ (output) | $\mathrm{PB}_{1}(1 / 0)$ |
| $\mathrm{PB}_{0}$ (input)/ $/ \mathrm{A}_{8}$ (output) | $\mathrm{PB}_{0}(1 / 0)$ |

Figure 8.10 Port B Pin Functions

### 8.8.2 Register Configuration

Table 8.13 shows the port B register configuration.
Table 8.13 Port B Registers

| Name | Abbreviation | R/W | Initial Value | Address* |
| :--- | :--- | :--- | :--- | :--- |
| Port B data direction register | PBDDR | W | H'00 $^{\prime}$ | H'FEBA |
| Port B data register | PBDR | R/W | H'00 $^{\text {H'FF6A }}$ |  |
| Port B register | PORTB | R | Undefined | H'FF5A |
| Port B MOS pull-up control register | PBPCR | R/W | H'00 $^{\text {H'O }}$ | H'FF71 |

Note: * Lower 16 bits of the address.

## Port B Data Direction Register (PBDDR)

| Bit | $:$ | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | PB7DDR | PB6DDR | PB5DDR | PB4DDR | PB3DDR | PB2DDR | PB1DDR | PB0DDR |
| Initial value | $:$ | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | $:$ | $W$ | $W$ | $W$ | $W$ | $W$ | $W$ | $W$ | $W$ |

PBDDR is an 8-bit write-only register, the individual bits of which specify input or output for the pins of port B. PBDDR cannot be read; if it is, an undefined value will be read.

This register is a write-only register, and cannot be written by bit manipulation instruction. For details, see section 2.10.4, Access Methods for Registers with Write-Only Bits.

PBDDR is initialized to $\mathrm{H}^{\prime} 00$ by a power-on reset and in hardware standby mode. It retains its prior state after a manual reset, and in software standby mode. The OPE bit in SBYCR is used to select whether the address output pins retain their output state or become high-impedance when a transition is made to software standby mode.

- Modes 1, 4, and 5

The corresponding port B pins are address outputs irrespective of the value of the PBDDR bits.

- Modes 2 and 6

Setting a PBDDR bit to 1 makes the corresponding port B pin an address output, while clearing the bit to 0 makes the pin an input port.

Note: Modes 2 and 6 cannot be used in the H8S/2240.

- Modes 3 and 7

Setting a PBDDR bit to 1 makes the corresponding port B pin an output port, while clearing the bit to 0 makes the pin an input port.

Note: Modes 3 and 7 cannot be used in the H8S/2240.

## Port B Data Register (PBDR)

| Bit |  | $:$ | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | PB7DR | PB6DR | PB5DR | PB4DR | PB3DR | PB2DR | PB1DR | PB0DR |  |  |
| Initial value : | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |  |  |
| R/W | $:$ | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |  |

PBDR is an 8-bit readable/writable register that stores output data for the port B pins $\left(\mathrm{PB}_{7}\right.$ to $\left.\mathrm{PB}_{0}\right)$. PBDR is initialized to $\mathrm{H}^{\prime} 00$ by a power-on reset, and in hardware standby mode. It retains its prior state after a manual reset, and in software standby mode.

## Port B Register (PORTB)

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | PB7 | PB6 | PB5 | PB4 | PB3 | PB2 | PB1 | PB0 |
| Initial value | —* | * | -* | —* | —* | —* | —* | —* |
| R/W | R | R | R | R | R | R | R | R |

Note: * Determined by state of pins $\mathrm{PB}_{7}$ to $\mathrm{PB}_{0}$.

PORTB is an 8-bit read-only register that shows the pin states. It cannot be written to. Writing of output data for the port B pins $\left(\mathrm{PB}_{7}\right.$ to $\left.\mathrm{PB}_{0}\right)$ must always be performed on PBDR.

If a port $B$ read is performed while $\operatorname{PBDDR}$ bits are set to 1 , the $\operatorname{PBDR}$ values are read. If a port $B$ read is performed while PBDDR bits are cleared to 0 , the pin states are read.

After a power-on reset and in hardware standby mode, PORTB contents are determined by the pin states, as PBDDR and PBDR are initialized. PORTB retains its prior state after a manual reset, and in software standby mode.

## Port B MOS Pull-Up Control Register (PBPCR)

| Bit | $:$ | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | PB7PCR | PB6PCR | PB5PCR | PB4PCR | PB3PCR | PB2PCR | PB1PCR | PB0PCR |  |
|  | Initial value $:$ | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | $:$ | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

PBPCR is an 8-bit readable/writable register that controls the MOS input pull-up function incorporated into port B on an individual bit basis.

When a PBDDR bit is cleared to 0 (input port setting) in mode 2, 3, 6 , or 7 , setting the corresponding PBPCR bit to 1 turns on the MOS input pull-up for the corresponding pin.

PBPCR is initialized to $\mathrm{H}^{\prime} 00$ by a power-on reset, and in hardware standby mode. It retains its prior state after a manual reset, and in software standby mode.

### 8.8.3 Pin Functions

## Modes 1, 4, and 5

In modes 1, 4, and 5, port B pins are automatically designated as address outputs.
Port B pin functions in modes 1, 4, and 5 are shown in figure 8.11.

|  | $\longrightarrow \mathrm{A}_{15}$ (output) |  |
| :---: | :---: | :---: | :---: |
|  | $\longrightarrow \mathrm{A}_{14}$ (output) |  |
| Port B | $\longrightarrow \mathrm{A}_{13}$ (output) |  |
|  | $\longrightarrow \mathrm{A}_{12}$ (output) |  |
|  | $\longrightarrow \mathrm{A}_{11}$ (output) |  |
|  | $\longrightarrow \mathrm{A}_{10}$ (output) |  |
|  | $\longrightarrow \mathrm{A}_{9}$ (output) |  |
|  |  | $\mathrm{A}_{8}$ (output) |

Figure 8.11 Port B Pin Functions (Modes 1, 4, and 5)

## Modes 2 and 6

In modes 2 and 6 , port B pins function as address outputs or input ports. Input or output can be specified on an individual bit basis. Setting a PBDDR bit to 1 makes the corresponding port B pin an address output, while clearing the bit to 0 makes the pin an input port.

Note: Modes 2 and 6 cannot be used in the H8S/2240.
Port B pin functions in modes 2 and 6 are shown in figure 8.12.

Figure 8.12 Port B Pin Functions (Modes 2 and 6)

## Modes 3 and 7

In modes 3 and 7, port B pins function as I/O ports. Input or output can be specified for each pin on an individual bit basis. Setting a PBDDR bit to 1 makes the corresponding port B pin an output port, while clearing the bit to 0 makes the pin an input port.

Note: Modes 3 and 7 cannot be used in the H8S/2240.
Port B pin functions in modes 3 and 7 are shown in figure 8.13.

## Figure 8.13 Port B Pin Functions (Modes 3 and 7)

### 8.8.4 MOS Input Pull-Up Function

Port B has a built-in MOS input pull-up function that can be controlled by software. This MOS input pull-up function can be used in modes $2,3,6$, and 7 , and can be specified as on or off on an individual bit basis.

When a PBDDR bit is cleared to 0 in mode 2,3,6, or 7 , setting the corresponding PBPCR bit to 1 turns on the MOS input pull-up for that pin.

The MOS input pull-up function is in the off state after a power-on reset, and in hardware standby mode. The prior state is retained after a manual reset, and in software standby mode.

Note: Modes 2, 3, 6, and 7 cannot be used in the H8S/2240.
Table 8.14 summarizes the MOS input pull-up states.
Table 8.14 MOS Input Pull-Up States (Port B)

| Modes | Power-On <br> Reset | Hardware <br> Standby Mode | Manual <br> Reset | Software <br> Standby Mode | In Other <br> Operations |
| :--- | :--- | :--- | :--- | :--- | :--- |
| $1,4,5$ | OFF | OFF | OFF | OFF | OFF |
| $2,3,6,7$ |  |  | ON/OFF | ON/OFF | ON/OFF |

Legend:
OFF: MOS input pull-up is always off.
ON/OFF: On when PBDDR $=0$ and $\operatorname{PBPCR}=1$; otherwise off.

### 8.9 Port C

### 8.9.1 Overview

Port C is an 8 -bit $\mathrm{I} / \mathrm{O}$ port. Port C has an address bus output function, and the pin functions change according to the operating mode.

Port C has a built-in MOS input pull-up function that can be controlled by software.
Figure 8.14 shows the port C pin configuration.

Pin functions in modes 1,4 , and 5
$\mathrm{A}_{7}$ (output)
$\mathrm{A}_{6}$ (output)
$\mathrm{A}_{5}$ (output)
$\mathrm{A}_{4}$ (output)
$\mathrm{A}_{3}$ (output)
$\mathrm{A}_{2}$ (output)
$\mathrm{A}_{1}$ (output)
$\mathrm{A}_{0}$ (output)

Pin functions in modes 2 and 6*
$\mathrm{PC}_{7}$ (input)/ $\mathrm{A}_{7}$ (output)
$\mathrm{PC}_{6}$ (input)/ $\mathrm{A}_{6}$ (output)
$\mathrm{PC}_{5}$ (input)/ $\mathrm{A}_{5}$ (output)
$\mathrm{PC}_{4}$ (input)/ $\mathrm{A}_{4}$ (output)
$\mathrm{PC}_{3}$ (input) $/ \mathrm{A}_{3}$ (output)
$\mathrm{PC}_{2}$ (input)/ $\mathrm{A}_{2}$ (output)
$\mathrm{PC}_{1}$ (input)/ $\mathrm{A}_{1}$ (output)
$\mathrm{PC}_{0}$ (input)/ $\mathrm{A}_{0}$ (output)

Pin functions in modes 3 and 7*
$\mathrm{PC}_{7}(\mathrm{I} / \mathrm{O})$
$\mathrm{PC}_{6}(\mathrm{I} / \mathrm{O})$
$\mathrm{PC}_{5}(\mathrm{I} / \mathrm{O})$
$\mathrm{PC}_{4}(\mathrm{I} / \mathrm{O})$
$\mathrm{PC}_{3}(\mathrm{I} / \mathrm{O})$
$\mathrm{PC}_{2}(\mathrm{I} / \mathrm{O})$
$\mathrm{PC}_{1}(\mathrm{I} / \mathrm{O})$
$\mathrm{PC}_{0}(\mathrm{I} / \mathrm{O})$

Note: * Modes 2, 3, 6, and 7 cannot be used in the H8S/2240.
Figure 8.14 Port C Pin Functions

### 8.9.2 Register Configuration

Table 8.15 shows the port C register configuration.
Table 8.15 Port C Registers

| Name | Abbreviation | R/W | Initial Value | Address* |
| :---: | :---: | :---: | :---: | :---: |
| Port C data direction register | PCDDR | W | H'00 | H'FEBB |
| Port C data register | PCDR | R/W | H'00 | H'FF6B |
| Port C register | PORTC | R | Undefined | H'FF5B |
| Port C MOS pull-up control register | PCPCR | R/W | H'00 | H'FF72 |

Note: * Lower 16 bits of the address.

## Port C Data Direction Register (PCDDR)

| Bit | $:$ | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | PC7DDR | PC6DDR | PC5DDR | PC4DDR | PC3DDR | PC2DDR | PC1DDR | PC0DDR |
| Initial value | $:$ | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | $:$ | $W$ | $W$ | $W$ | $W$ | $W$ | $W$ | $W$ | $W$ |

PCDDR is an 8-bit write-only register, the individual bits of which specify input or output for the pins of port C. PCDDR cannot be read; if it is, an undefined value will be read.

This register is a write-only register, and cannot be written by bit manipulation instruction. For details, see section 2.10.4, Access Methods for Registers with Write-Only Bits.

PCDDR is initialized to $\mathrm{H}^{\prime} 00$ by a power-on reset and in hardware standby mode. It retains its prior state after a manual reset, and in software standby mode. The OPE bit in SBYCR is used to select whether the address output pins retain their output state or become high-impedance when a transition is made to software standby mode.

- Modes 1, 4, and 5

The corresponding port C pins are address outputs irrespective of the value of the PCDDR bits.

- Modes 2 and 6

Setting a PCDDR bit to 1 makes the corresponding port C pin an address output, while clearing the bit to 0 makes the pin an input port.

Note: Modes 2 and 6 cannot be used in the H8S/2240.

- Modes 3 and 7

Setting a PCDDR bit to 1 makes the corresponding port C pin an output port, while clearing the bit to 0 makes the pin an input port.

Note: Modes 3 and 7 cannot be used in the H8S/2240.

## Port C Data Register (PCDR)

| Bit | 7 | 5 |  | 4 | 3 | 21 |  | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | PC7DR | PC6DR | PC5DR | PC4DR | PC3DR | PC2DR | PC1DR | PC0DR |
| Initial value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

PCDR is an 8-bit readable/writable register that stores output data for the port C pins $\left(\mathrm{PC}_{7}\right.$ to $\left.\mathrm{PC}_{0}\right)$.
PCDR is initialized to $\mathrm{H}^{\prime} 00$ by a power-on reset, and in hardware standby mode. It retains its prior state after a manual reset, and in software standby mode.

## Port C Register (PORTC)

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | PC7 | PC6 | PC5 | PC4 | PC3 | PC2 | PC1 | PC0 |
| Initial value | —* | -* | * | —* | —* | —* | -* | —* |
| R/W | R | R | R | R | R | R | R | R |

Note: * Determined by state of pins $\mathrm{PC}_{7}$ to $\mathrm{PC}_{0}$.

PORTC is an 8-bit read-only register that shows the pin states. It cannot be written to. Writing of output data for the port C pins $\left(\mathrm{PC}_{7}\right.$ to $\left.\mathrm{PC}_{0}\right)$ must always be performed on PCDR.

If a port C read is performed while PCDDR bits are set to 1 , the PCDR values are read. If a port C read is performed while PCDDR bits are cleared to 0 , the pin states are read.

After a power-on reset and in hardware standby mode, PORTC contents are determined by the pin states, as PCDDR and PCDR are initialized. PORTC retains its prior state after a manual reset, and in software standby mode.

## Port C MOS Pull-Up Control Register (PCPCR)

| Bit | $:$ | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | PC7PCR | PC6PCR | PC5PCR | PC4PCR | PC3PCR | PC2PCR | PC1PCR | PCOPCR |

PCPCR is an 8-bit readable/writable register that controls the MOS input pull-up function incorporated into port C on an individual bit basis.

When a PCDDR bit is cleared to 0 (input port setting) in mode 2, 3, 6 , or 7 , setting the corresponding PCPCR bit to 1 turns on the MOS input pull-up for the corresponding pin.

PCPCR is initialized to $\mathrm{H}^{\prime} 00$ by a power-on reset, and in hardware standby mode. It retains its prior state after a manual reset, and in software standby mode.

### 8.9.3 Pin Functions

## Modes 1, 4, and 5

In modes 1,4 , and 5 , port C pins are automatically designated as address outputs.
Port C pin functions in modes 1,4 , and 5 are shown in figure 8.15.

Figure 8.15 Port C Pin Functions (Modes 1, 4, and 5)

## Modes 2 and 6

In modes 2 and 6 , port $C$ pins function as address outputs or input ports. Input or output can be specified on an individual bit basis. Setting a PCDDR bit to 1 makes the corresponding port C pin an address output, while clearing the bit to 0 makes the pin an input port.

Note: Modes 2 and 6 cannot be used in the H8S/2240.
Port C pin functions in modes 2 and 6 are shown in figure 8.16.

Figure 8.16 Port C Pin Functions (Modes 2 and 6)

## Modes 3 and 7

In modes 3 and 7, port $C$ pins function as I/O ports. Input or output can be specified for each pin on an individual bit basis. Setting a PCDDR bit to 1 makes the corresponding port C pin an output port, while clearing the bit to 0 makes the pin an input port.

Note: Modes 3 and 7 cannot be used in the H8S/2240.

Port C pin functions in modes 3 and 7 are shown in figure 8.17.

Figure 8.17 Port C Pin Functions (Modes 3 and 7)

### 8.9.4 MOS Input Pull-Up Function

Port C has a built-in MOS input pull-up function that can be controlled by software. This MOS input pull-up function can be used in modes $2,3,6$, and 7 , and can be specified as on or off on an individual bit basis.

When a PCDDR bit is cleared to 0 in mode 2,3,6, or 7 , setting the corresponding PCPCR bit to 1 turns on the MOS input pull-up for that pin.

The MOS input pull-up function is in the off state after a power-on reset, and in hardware standby mode. The prior state is retained after a manual reset, and in software standby mode.

Note: Modes 2, 3, 6, and 7 cannot be used in the H8S/2240.
Table 8.16 summarizes the MOS input pull-up states.
Table 8.16 MOS Input Pull-Up States (Port C)

| Modes | Power-On <br> Reset | Hardware <br> Standby Mode | Manual <br> Reset | Software <br> Standby Mode | In Other <br> Operations |
| :--- | :--- | :--- | :--- | :--- | :--- |
| $1,4,5$ | OFF | OFF | OFF | OFF | OFF |
| $2,3,6,7$ |  | ON/OFF | ON/OFF | ON/OFF |  |

## Legend:

OFF: MOS input pull-up is always off.
ON/OFF: On when PCDDR $=0$ and $\operatorname{PCPCR}=1$; otherwise off.

### 8.10 Port D

### 8.10.1 Overview

Port D is an 8 -bit I/O port. Port D has a data bus I/O function, and the pin functions change according to the operating mode.

Port D has a built-in MOS input pull-up function that can be controlled by software.
Figure 8.18 shows the port D pin configuration.

Figure 8.18 Port D Pin Functions

### 8.10.2 Register Configuration

Table 8.17 shows the port D register configuration.

## Table 8.17 Port D Registers

| Name | Abbreviation | R/w | Initial Value | Address* |
| :--- | :--- | :--- | :--- | :--- |
| Port D data direction register | PDDDR | W | H''00 $^{\prime}$ | H'FEBC |
| Port D data register | PDDR | R/W | H'00 | H'FF6C $^{\text {Port D register }}$ |
| PORTD | R | Undefined | H'FF5C $^{\text {Port D MOS pull-up control register }}$ | PDPCR |

Note: * Lower 16 bits of the address.

## Port D Data Direction Register (PDDDR)

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | PD7DDR | PD6DDR | PD5DDR | PD4DDR | PD3DDR | PD2DDR | PD1DDR | PDODDR |
| Initial value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | W | W | W | W | W | W | W | W |

PDDDR is an 8-bit write-only register, the individual bits of which specify input or output for the pins of port D. PDDDR cannot be read; if it is, an undefined value will be read.

This register is a write-only register, and cannot be written by bit manipulation instruction. For details, see section 2.10.4, Access Methods for Registers with Write-Only Bits.

PDDDR is initialized to $\mathrm{H}^{\prime} 00$ by a power-on reset, and in hardware standby mode. It retains its prior state after a manual reset, and in software standby mode.

- Modes $1,2,4,5$, and 6

The input/output direction specification by PDDDR is ignored, and port D is automatically designated for data I/O.

Note: Modes 2 and 6 cannot be used in the H8S/2240.

- Modes 3 and 7

Setting a PDDDR bit to 1 makes the corresponding port D pin an output port, while clearing the bit to 0 makes the pin an input port.

Note: Modes 3 and 7 cannot be used in the H8S/2240.

## Port D Data Register (PDDR)

| Bit | $:$ | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | PD7DR | PD6DR | PD5DR | PD4DR | PD3DR | PD2DR | PD1DR | PDODR |  |
|  | Initial value | : | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| 0 |  |  |  |  |  |  |  |  |  |
| R/W | $:$ | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

PDDR is an 8 -bit readable/writable register that stores output data for the port D pins $\left(\mathrm{PD}_{7}\right.$ to $\left.\mathrm{PD}_{0}\right)$.
PDDR is initialized to $\mathrm{H}^{\prime} 00$ by a power-on reset, and in hardware standby mode. It retains its prior state after a manual reset, and in software standby mode.

## Port D Register (PORTD)

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | PD7 | PD6 | PD5 | PD4 | PD3 | PD2 | PD1 | PD0 |
| Initial value | —* | —* | —* | —* | —* | —* | —* | —* |
| R/W | R | R | R | R | R | R | R | R |

Note: * Determined by state of pins $\mathrm{PD}_{7}$ to $\mathrm{PD}_{0}$.

PORTD is an 8 -bit read-only register that shows the pin states. It cannot be written to. Writing of output data for the port D pins $\left(\mathrm{PD}_{7}\right.$ to $\left.\mathrm{PD}_{0}\right)$ must always be performed on PDDR.

If a port D read is performed while PDDDR bits are set to 1 , the PDDR values are read. If a port D read is performed while PDDDR bits are cleared to 0 , the pin states are read.

After a power-on reset and in hardware standby mode, PORTD contents are determined by the pin states, as PDDDR and PDDR are initialized. PORTD retains its prior state after a manual reset, and in software standby mode.

Port D MOS Pull-Up Control Register (PDPCR)

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | PD7PCR | PD6PCR | PD5PCR | PD4PCR | PD3PCR | PD2PCR | PD1PCR | PDOPCR |
| Initial value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

PDPCR is an 8-bit readable/writable register that controls the MOS input pull-up function incorporated into port D on an individual bit basis.

When a PDDDR bit is cleared to 0 (input port setting) in mode 3 or 7 , setting the corresponding PDPCR bit to 1 turns on the MOS input pull-up for the corresponding pin.

PDPCR is initialized to $\mathrm{H}^{\prime} 00$ by a power-on reset, and in hardware standby mode. It retains its prior state after a manual reset, and in software standby mode.

### 8.10.3 Pin Functions

## Modes 1, 2, 4, 5, and 6

In modes $1,2,4,5$, and 6 , port D pins are automatically designated as data I/O pins.
Note: Modes 2 and 6 cannot be used in the H8S/2240.
Port D pin functions in modes $1,2,4,5$, and 6 are shown in figure 8.19.

Figure 8.19 Port D Pin Functions (Modes 1, 2, 4, 5, and 6)

## Modes 3 and 7

In modes 3 and 7, port D pins function as I/O ports. Input or output can be specified for each pin on an individual bit basis. Setting a PDDDR bit to 1 makes the corresponding port D pin an output port, while clearing the bit to 0 makes the pin an input port.

Note: Modes 3 and 7 cannot be used in the H8S/2240.
Port D pin functions in modes 3 and 7 are shown in figure 8.20.
$\square$
Figure 8.20 Port D Pin Functions (Modes 3 and 7)

### 8.10.4 MOS Input Pull-Up Function

Port D has a built-in MOS input pull-up function that can be controlled by software. This MOS input pull-up function can be used in modes 3 and 7 , and can be specified as on or off on an individual bit basis.

When a PDDDR bit is cleared to 0 in mode 3 or 7 , setting the corresponding PDPCR bit to 1 turns on the MOS input pull-up for that pin.

The MOS input pull-up function is in the off state after a power-on reset, and in hardware standby mode. The prior state is retained after a manual reset, and in software standby mode.

Note: Modes 2, 3, 6, and 7 cannot be used in the $\mathrm{H} 8 \mathrm{~S} / 2240$.
Table 8.18 summarizes the MOS input pull-up states.
Table 8.18 MOS Input Pull-Up States (Port D)

| Modes | Power-On <br> Reset | Hardware <br> Standby Mode | Manual <br> Reset | Software <br> Standby Mode | In Other <br> Operations |
| :--- | :--- | :--- | :--- | :--- | :--- |
| $1,2,4$ to 6 | OFF | OFF | OFF | OFF | OFF |
| 3,7 |  |  | ON/OFF | ON/OFF | ON/OFF |

Legend:
OFF: MOS input pull-up is always off.
ON/OFF: On when PDDDR $=0$ and $\operatorname{PDPCR}=1$; otherwise off.

### 8.11 Port E

### 8.11.1 Overview

Port E is an 8 -bit I/O port. Port E has a data bus I/O function, and the pin functions change according to the operating mode and whether 8 -bit or 16 -bit bus mode is selected.

Port E has a built-in MOS input pull-up function that can be controlled by software.
Figure 8.21 shows the port E pin configuration.

Figure 8.21 Port E Pin Functions

### 8.11.2 Register Configuration

Table 8.19 shows the port E register configuration.
Table 8.19 Port E Registers

| Name | Abbreviation | R/W | Initial Value | Address* |
| :---: | :---: | :---: | :---: | :---: |
| Port E data direction register | PEDDR | W | H'00 | H'FEBD |
| Port E data register | PEDR | R/W | H'00 | H'FF6D |
| Port E register | PORTE | R | Undefined | H'FF5D |
| Port E MOS pull-up control register | PEPCR | R/W | H'00 | H'FF74 |

Note: * Lower 16 bits of the address.

## Port E Data Direction Register (PEDDR)

| Bit | $:$ | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |  |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | PE7DDR | PE6DDR | PE5DDR | PE4DDR | PE3DDR | PE2DDR | PE1DDR | PE0DDR |  |  |
|  | Initial value | $:$ | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | $:$ | W | W | W | W | W | W | W | W |  |

PEDDR is an 8-bit write-only register, the individual bits of which specify input or output for the pins of port E. PEDDR cannot be read; if it is, an undefined value will be read.

This register is a write-only register, and cannot be written by bit manipulation instruction. For details, see section 2.10.4, Access Methods for Registers with Write-Only Bits.

PEDDR is initialized to $\mathrm{H}^{\prime} 00$ by a power-on reset, and in hardware standby mode. It retains its prior state after a manual reset, and in software standby mode.

- Modes 1, 2, 4, 5, and 6

When 8 -bit bus mode has been selected, port E pins function as I/O ports. Setting a PEDDR bit to 1 makes the corresponding port E pin an output port, while clearing the bit to 0 makes the pin an input port.
When 16-bit bus mode has been selected, the input/output direction specification by PEDDR is ignored, and port E is designated for data $\mathrm{I} / \mathrm{O}$.
For details of 8-bit and 16-bit bus modes, see section 6, Bus Controller.

Note: Modes 2 and 6 cannot be used in the H8S/2240.

- Modes 3 and 7

Setting a PEDDR bit to 1 makes the corresponding port E pin an output port, while clearing the bit to 0 makes the pin an input port.

Note: Modes 3 and 7 cannot be used in the H8S/2240.

## Port E Data Register (PEDR)

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | PE7DR | PE6DR | PE5DR | PE4DR | PE3DR | PE2DR | PE1DR | PE0DR |
| Initial value : | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

PEDR is an 8-bit readable/writable register that stores output data for the port E pins $\left(\mathrm{PE}_{7}\right.$ to $\left.\mathrm{PE}_{0}\right)$.
PEDR is initialized to H'00 by a power-on reset, and in hardware standby mode. It retains its prior state after a manual reset, and in software standby mode.

## Port E Register (PORTE)

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | PE7 | PE6 | PE5 | PE4 | PE3 | PE2 | PE1 | PEO |
| Initial value | —* | —* | —* | —* | * | * | -* | —* |
| R/W | R | R | R | R | R | R | R | R |

Note: * Determined by state of pins $\mathrm{PE}_{7}$ to $\mathrm{PE}_{0}$.

PORTE is an 8-bit read-only register that shows the pin states. It cannot be written to. Writing of output data for the port E pins $\left(\mathrm{PE}_{7}\right.$ to $\left.\mathrm{PE}_{0}\right)$ must always be performed on PEDR.

If a port $E$ read is performed while PEDDR bits are set to 1 , the PEDR values are read. If a port E read is performed while PEDDR bits are cleared to 0 , the pin states are read.

After a power-on reset and in hardware standby mode, PORTE contents are determined by the pin states, as PEDDR and PEDR are initialized. PORTE retains its prior state after a manual reset, and in software standby mode.

Port E MOS Pull-Up Control Register (PEPCR)

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | PE7PCR | PE6PCR | PE5PCR | PE4PCR | PE3PCR | PE2PCR | PE1PCR | PEOPCR |
| Initial value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

PEPCR is an 8-bit readable/writable register that controls the MOS input pull-up function incorporated into port E on an individual bit basis.

When a PEDDR bit is cleared to 0 (input port setting) when 8 -bit bus mode is selected in mode 1 , $2,4,5$, or 6 , or in mode 3 or 7 , setting the corresponding PEPCR bit to 1 turns on the MOS input pull-up for the corresponding pin.

PEPCR is initialized to $\mathrm{H}^{\prime} 00$ by a power-on reset, and in hardware standby mode. It retains its prior state after a manual reset, and in software standby mode.

### 8.11.3 Pin Functions

## Modes 1, 2, 4, 5, and 6

In modes $1,2,4,5$, and 6 , when 8 -bit access is designated and 8 -bit bus mode is selected, port E pins are automatically designated as I/O ports. Setting a PEDDR bit to 1 makes the corresponding port E pin an output port, while clearing the bit to 0 makes the pin an input port.

When 16-bit bus mode is selected, the input/output direction specification by PEDDR is ignored, and port E is designated for data I/O.

Note: Modes 2 and 6 cannot be used in the H8S/2240.
Port E pin functions in modes $1,2,4,5$, and 6 are shown in figure 8.22.

Figure 8.22 Port E Pin Functions (Modes 1, 2, 4, 5, and 6)

## Modes 3 and 7

In modes 3 and 7, port E pins function as I/O ports. Input or output can be specified for each pin on a bit-by-bit basis. Setting a PEDDR bit to 1 makes the corresponding port E pin an output port, while clearing the bit to 0 makes the pin an input port.

Note: Modes 3 and 7 cannot be used in the H8S/2240.

Port E pin functions in modes 3 and 7 are shown in figure 8.23.

| Port E | $\begin{aligned} & \longleftrightarrow \mathrm{PE}_{7}(\mathrm{I} / \mathrm{O}) \\ & \longleftrightarrow \mathrm{PE}_{6}(\mathrm{I} / \mathrm{O}) \\ & \longleftrightarrow \mathrm{PE}_{5}(\mathrm{I} / \mathrm{O}) \\ & \longleftrightarrow \mathrm{PE}_{4}(\mathrm{I} / \mathrm{O}) \\ & \longleftrightarrow \mathrm{PE}_{3}(\mathrm{I} / \mathrm{O}) \\ & \longleftrightarrow \mathrm{PE}_{2}(\mathrm{I} / \mathrm{O}) \\ & \longleftrightarrow \mathrm{PE}_{1}(\mathrm{I} / \mathrm{O}) \\ & \longleftrightarrow \mathrm{PE}_{0}(\mathrm{I} / \mathrm{O}) \end{aligned}$ |
| :---: | :---: |

Figure 8.23 Port E Pin Functions (Modes 3 and 7)

### 8.11.4 MOS Input Pull-Up Function

Port E has a built-in MOS input pull-up function that can be controlled by software. This MOS input pull-up function can be used in modes $1,2,4,5$, and 6 when 8 -bit bus mode is selected, or in mode 3 or 7 , and can be specified as on or off on an individual bit basis.

When a PEDDR bit is cleared to 0 in mode $1,2,4,5$, or 6 when 8 -bit bus mode is selected, or in mode 3 or 7 , setting the corresponding PEPCR bit to 1 turns on the MOS input pull-up for that pin.

The MOS input pull-up function is in the off state after a power-on reset, and in hardware standby mode. The prior state is retained after a manual reset, and in software standby mode.

Note: Modes 2, 3, 6, and 7 cannot be used in the H8S/2240.
Table 8.20 summarizes the MOS input pull-up states.
Table 8.20 MOS Input Pull-Up States (Port E)
$\left.\begin{array}{llllll}\text { Modes } & & \begin{array}{l}\text { Power-On } \\ \text { Reset }\end{array} & \begin{array}{l}\text { Hardware } \\ \text { Standby Mode }\end{array} & \begin{array}{l}\text { Manual } \\ \text { Reset }\end{array} & \begin{array}{l}\text { Software } \\ \text { Standby Mode }\end{array}\end{array} \begin{array}{l}\text { In Other } \\ \text { Operations }\end{array}\right]$

Legend:
OFF: MOS input pull-up is always off.
ON/OFF: On when PEDDR $=0$ and $\operatorname{PEPCR}=1$; otherwise off.

### 8.12 Port F

### 8.12.1 Overview

Port F is an 8-bit I/O port. Port F pins also function as bus control signal input/output pins ( $\overline{\mathrm{AS}}$, $\overline{\mathrm{RD}}, \overline{\mathrm{HWR}}, \overline{\mathrm{LWR}}, \overline{\mathrm{WAIT}}, \overline{\mathrm{BREQO}}, \overline{\mathrm{BREQ}}$, and $\overline{\mathrm{BACK}})$, the system clock $(\phi)$ output pin and interrupt input pins ( $\overline{\mathrm{IRQ} 0}$ to $\overline{\mathrm{IRQ} 3})$.

The interrupt input pins ( $\overline{\mathrm{IRQ} 0}$ to $\overline{\mathrm{IRQ} 3})$ are Schmitt-triggered inputs.
Figure 8.24 shows the port F pin configuration.

Note: * Modes 2, 3, 6, and 7 cannot be used in the H8S/2240.
Figure 8.24 Port F Pin Functions

### 8.12.2 Register Configuration

Table 8.21 shows the port F register configuration.

## Table 8.21 Port F Registers

| Name | Abbreviation | R/w | Initial Value | Address* ${ }^{1}$ |
| :--- | :--- | :--- | :--- | :--- |
| Port F data direction register | PFDDR | W | H $^{\prime} 80 / H^{\prime} 00^{* 2}$ | H'FEBE $^{\prime}$ |
| Port F data register | PFDR | R/W | H'0 $^{\prime} 00$ | H'FF6E $^{\prime}$ |
| Port F register | PORTF | R | Undefined | H'FF5E |

Notes: 1. Lower 16 bits of the address.
2. Initial value depends on the mode.

## Port F Data Direction Register (PFDDR)

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | PF7DDR | PF6DDR | PF5DDR | PF4DDR | PF3DDR | PF2DDR | PF1DDR | PFODDR |
| Modes 1, 2, 4, 5, 6 |  |  |  |  |  |  |  |  |
| Initial value | 1 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | W | W | W | W | W | W | W | W |
| Modes 3 and 7 |  |  |  |  |  |  |  |  |
| Initial value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | w | W | W | w | w | W | W | W |

PFDDR is an 8-bit write-only register, the individual bits of which specify input or output for the pins of port F. PFDDR cannot be read; if it is, an undefined value will be read.

This register is a write-only register, and cannot be written by bit manipulation instruction. For details, see section 2.10.4, Access Methods for Registers with Write-Only Bits.

PFDDR is initialized by a power-on reset, and in hardware standby mode, to $\mathrm{H}^{\prime} 80$ in modes 1,2 , 4,5 , and 6 , and to $\mathrm{H}^{\prime} 00$ in modes 3 and 7. It retains its prior state after a manual reset, and in software standby mode. The OPE bit in SBYCR is used to select whether the bus control output pins retain their output state or become high-impedance when a transition is made to software standby mode.

- Modes 1, 2, 4, 5, and 6

Pin $\mathrm{PF}_{7}$ functions as the $\phi$ output pin when the corresponding PFDDR bit is set to 1 , and as an input port when the bit is cleared to 0 .

The input/output direction specified by PFDDR is ignored for pins $\mathrm{PF}_{6}$ to $\mathrm{PF}_{3}$, which are automatically designated as bus control outputs ( $\overline{\mathrm{AS}}, \overline{\mathrm{RD}}, \overline{\mathrm{HWR}}$, and $\overline{\mathrm{LWR}})$.
For pins $\mathrm{PF}_{2}$ to $\mathrm{PF}_{0}$, setting a PFDDR bit to 1 makes the corresponding port F pin an output port, while clearing the bit to 0 makes the pin an input port.

Note: Modes 2 and 6 cannot be used in the H8S/2240.

- Modes 3 and 7

Setting a PFDDR bit to 1 makes the corresponding port F pin $\mathrm{PF}_{6}$ to $\mathrm{PF}_{0}$ an output port, or in the case of pin $\mathrm{PF}_{7}$, the $\phi$ output pin. Clearing the bit to 0 makes the pin an input port.

Note: Modes 3 and 7 cannot be used in the H8S/2240.

## Port F Data Register (PFDR)

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | PF7DR | PF6DR | PF5DR | PF4DR | PF3DR | PF2DR | PF1DR | PF0DR |
| Initial value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

PFDR is an 8-bit readable/writable register that stores output data for the port F pins $\left(\mathrm{PF}_{7}\right.$ to $\left.\mathrm{PF}_{0}\right)$.
PFDR is initialized to H'00 by a power-on reset, and in hardware standby mode. It retains its prior state after a manual reset, and in software standby mode.

## Port F Register (PORTF)

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | PF7 | PF6 | PF5 | PF4 | PF3 | PF2 | PF1 | PFO |
| Initial value | —* | —* | —* | —* | —* | —* | —* | —* |
| R/W | R | R | R | R | R | R | R | R |

Note: * Determined by state of pins $\mathrm{PF}_{7}$ to $\mathrm{PF}_{0}$.

PORTF is an 8-bit read-only register that shows the pin states. Writing of output data for the port F pins $\left(\mathrm{PF}_{7}\right.$ to $\left.\mathrm{PF}_{0}\right)$ must always be performed on PFDR .

If a port $F$ read is performed while PFDDR bits are set to 1 , the $\operatorname{PFDR}$ values are read. If a port $F$ read is performed while PFDDR bits are cleared to 0 , the pin states are read.

After a power-on reset and in hardware standby mode, PORTF contents are determined by the pin states, as PFDDR and PFDR are initialized. PORTF retains its prior state after a manual reset, and in software standby mode.

### 8.12.3 Pin Functions

Port $F$ pins also function as bus control signal input/output pins ( $\overline{\mathrm{AS}}, \overline{\mathrm{RD}}, \overline{\mathrm{HWR}}, \overline{\mathrm{LWR}}, \overline{\mathrm{WAIT}}$, $\overline{\mathrm{BREQO}}, \overline{\mathrm{BREQ}}$, and $\overline{\mathrm{BACK}}$ ), the system clock ( $\phi$ ) output pin and interrupt input pins ( $\overline{\mathrm{IRQ} 0}$ to $\overline{\mathrm{IRQ}} \overline{3}$ ). The pin functions differ between modes $1,2,4,5$, and 6 , and modes 3 and 7. Port F pin functions are shown in table 8.22.

## Table 8.22 Port F Pin Functions

Pin Selection Method and Pin Functions
$\mathrm{PF}_{7} / \phi \quad$ The pin function is switched as shown below according to bit PF7DDR.

| PF7DDR | 0 | 1 |
| :--- | :---: | :---: |
| Pin function | $\mathrm{PF}_{7}$ input pin | $\phi$ output pin |

$\overline{\mathrm{PF}_{6} / \overline{\mathrm{AS}} \quad \text { The pin function is switched as shown below according to the operating mode }}$ and bit PF6DDR.

| Operating <br> Mode | Modes 1, 2, 4, 5, 6* | Modes 3 and 7* |  |
| :--- | :---: | :---: | :---: |
| PF6DDR | - | 0 | 1 |
| Pin function | $\overline{\text { AS }}$ output pin | $\mathrm{PF}_{6}$ input pin | $\mathrm{PF}_{6}$ output pin |

Note: * Modes 2, 3, 6, and 7 cannot be used in the H8S/2240.
$\overline{\mathrm{PF}_{5} / \overline{\mathrm{RD}} \quad \text { The pin function is switched as shown below according to the operating mode }}$ and bit PF5DDR.

| Operating <br> Mode | Modes 1, 2, 4, 5, 6* | Modes 3 and 7* |  |
| :--- | :---: | :---: | :---: |
| PF5DDR | - | 0 | 1 |
| Pin function | $\overline{\text { RD }}$ output pin | $\mathrm{PF}_{5}$ input pin | $\mathrm{PF}_{5}$ output pin |

Note: * Modes 2, 3, 6, and 7 cannot be used in the H8S/2240.

| Pin | Selection Method and Pin Functions |  |  |  |
| :---: | :---: | :---: | :---: | :---: |
| $\overline{\mathrm{PF}_{4} / \overline{\mathrm{HWR}}}$ | The pin function is switched as shown below according to the operating mode and bit PF4DDR. |  |  |  |
|  | Operating Mode | Modes 1, 2, 4, 5, 6* | Modes 3 and 7* |  |
|  | PF4DDR | - | 0 | 1 |
|  | Pin function | $\overline{\text { HWR output pin }}$ | $\mathrm{PF}_{4}$ input pin | $\mathrm{PF}_{4}$ output pin |

Note: * Modes 2, 3, 6, and 7 cannot be used in the H8S/2240.
$\mathrm{PF}_{3} / \overline{\mathrm{LWR}} / \overline{\mathrm{IRQ3}}$ The pin function is switched as shown below according to the operating mode and bit PF3DDR.

| Operating <br> Mode | Modes | Modes <br> Mond $7 *^{2}$ |  |
| :--- | :---: | :---: | :---: |
| PF3DDR | $1,2,4,5,6 *^{2}$ | 3 and |  |
| Pin function | - | 0 | 1 |
|  | LWR output pin | $\mathrm{PF}_{3}$ input pin | $\mathrm{PF}_{3}$ output pin |
|  | $\overline{\text { RQS }}$ interrupt input pin* |  |  |

Notes: 1. When this pin is used as an external interrupt input, it should not be used as an input/output pin with other functions.
2. Modes 2, 3, 6, and 7 cannot be used in the H8S/2240.
$\mathrm{PF}_{2} / \overline{\mathrm{WAIT}} /$
$\overline{\mathrm{BREQO}} / \overline{\mathrm{RQ} 2}$

The pin function is switched as shown below according to the operating mode, and the BREQOE bit, WAITE bit in BCRL, and PF2DDR bit.

| Operating Mode | Modes 1, 2, 4, 5, 6* ${ }^{\text {2 }}$ |  |  |  | Modes 3 and 7*² |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| BREQOE | 0 |  |  | 1 | - |  |
| WAITE | 0 |  | 1 | - | - |  |
| PF2DDR | 0 | 1 | - | - | 0 | 1 |
| Pin function | $\mathrm{PF}_{2}$ <br> input pin | $\mathrm{PF}_{2}$ <br> output pin | $\overline{\text { WAIT }}$ <br> input pin | $\overline{\overline{\text { BREQO }}}$ <br> output pin | $\mathrm{PF}_{2}$ <br> input pin | $\mathrm{PF}_{2}$ <br> output pin |
|  | IRQ2 interrupt input pin* ${ }^{1}$ |  |  |  |  |  |

Notes: 1. When this pin is used as an external interrupt input, it should not be used as an input/output pin with other functions.
2. Modes 2, 3, 6, and 7 cannot be used in the H8S/2240.

## Pin Selection Method and Pin Functions

## $\mathrm{PF}_{1} / \overline{\mathrm{BACK}} / \overline{\mathrm{RQQ}}$

The pin function is switched as shown below according to the operating mode, and the BRLE bit in BCRL and PF1DDR bit.

| Operating <br> Mode | Modes 1, 2, 4, 5, $6 *^{2}$ |  |  | Modes 3 and $7 *^{2}$ |  |
| :--- | :---: | :---: | :---: | :---: | :---: |
| BRLE | 0 |  | 1 | - |  |
| PF1DDR | 0 | 1 | - | 0 | 1 |
| Pin function | $\mathrm{PF}_{1}$ <br> input pin | $\mathrm{PF}_{1}$ <br> output pin | $\overline{\mathrm{BACK}}$ <br> output pin | $\mathrm{PF}_{1}$ <br> input pin | $\mathrm{PF}_{1}$ <br> output pin |
|  | $\overline{\text { IRQ1 }}$ interrupt input pin*1 |  |  |  |  |

Notes: 1. When this pin is used as an external interrupt input, it should not be used as an input/output pin with other functions.
2. Modes 2, 3, 6, and 7 cannot be used in the H8S/2240.
$\overline{\mathrm{PF}} / \overline{\mathrm{BREQ}} / \overline{\mathrm{IRQ0}} \quad$ The pin function is switched as shown below according to the operating mode, and the BRLE bit in BCRL and PFODDR bit.

| Operating <br> Mode | Modes $1,2,4,5,6 *^{2}$ |  |  | Modes 3 and $7 *^{2}$ |  |
| :--- | :---: | :---: | :---: | :---: | :---: |

| PF0DDR | 0 | 1 | - | 0 | 1 |
| Pin function | $\mathrm{PF}_{0}$ <br> input pin | $\mathrm{PF}_{0}$ <br> output pin | BREQ <br> input pin | $\mathrm{PF}_{0}$ <br> input pin | $\mathrm{PF}_{0}$ <br> output pin |
|  | $\overline{\mathrm{IRQO}}$ interrupt input pin*1 |  |  |  |  |

Notes: 1. When this pin is used as an external interrupt input, it should not be used as an input/output pin with other functions.
2. Modes 2, 3, 6, and 7 cannot be used in the H8S/2240.

### 8.13 Port G

### 8.13.1 Overview

Port G is a 5-bit I/O port. Port G pins also function as bus control signal output pins ( $\overline{\mathrm{CS} 0}$ to $\overline{\mathrm{CS} 3}$ ). The A/D converter input pin ( $\overline{\text { ADTRG }})$, and interrupt input pins ( $\overline{\text { IRQ6, }} \overline{\text { IRQ7 }})$. The interrupt input pins ( $\overline{\mathrm{IRQ6}}, \overline{\mathrm{IRQ} 7}$ ) are Schmitt-triggered inputs.

Figure 8.25 shows the port G pin configuration.

Pin functions in modes 3 and 7*
$\mathrm{PG}_{4}(\mathrm{I} / \mathrm{O})$
$\mathrm{PG}_{3}(\mathrm{I} / \mathrm{O})$
$\mathrm{PG}_{2}(\mathrm{I} / \mathrm{O})$
$\mathrm{PG}_{1}(\mathrm{I} / \mathrm{O}) / \overline{\mathrm{RQQ7}}$ (input)
$\mathrm{PG}_{0}(\mathrm{I} / \mathrm{O}) / \overline{\text { ADTRG }}$ (input)// $\overline{\mathrm{RQ} 6}$ (input)

Pin functions in modes 1 and 2*
$\mathrm{PG}_{4}$ (input)/ $\overline{\mathrm{CSO}}$ (output)
$\mathrm{PG}_{3}(\mathrm{I} / \mathrm{O})$
$\mathrm{PG}_{2}(\mathrm{I} / \mathrm{O})$
$\mathrm{PG}_{1}(\mathrm{I} / \mathrm{O}) / \overline{\mathrm{RQ} 7}$ (input)
$\mathrm{PG}_{0}(\mathrm{I} / \mathrm{O}) / \overline{\mathrm{ADTRG}}$ (input)// $\overline{\mathrm{RQ6}}$ (input)

Pin functions in modes 4 to 6*
$\mathrm{PG}_{4}$ (input)/ $\overline{\mathrm{CSO}}$ (output)
$\mathrm{PG}_{3}$ (input)/ $\overline{\mathrm{CS} 1}$ (output)
$\mathrm{PG}_{2}$ (input)/ $\overline{\mathrm{CS} 2}$ (output)
$\mathrm{PG}_{1}$ (input)/ $\overline{\mathrm{CS3}}$ (output)///RQ7 (input)
$\mathrm{PG}_{0}(\mathrm{I} / \mathrm{O}) / \overline{\mathrm{ADTRG}}$ (input)//]RQ6 (input)

Note: * Modes 2, 3, 6, and 7 cannot be used in the H8S/2240.
Figure 8.25 Port G Pin Functions

### 8.13.2 Register Configuration

Table 8.23 shows the port $G$ register configuration.

## Table 8.23 Port G Registers

| Name | Abbreviation | R/W | Initial Value* ${ }^{1}$ | Address* ${ }^{2}$ |
| :---: | :---: | :---: | :---: | :---: |
| Port G data direction register | PGDDR | W | $\mathrm{H}^{\prime} 00 / \mathrm{H}^{\prime} 10{ }^{3}$ | H'FEBF |
| Port G data register | PGDR | R/W | H'00 | H'FF6F |
| Port G register | PORTG | R | Undefined | H'FF5F |

Notes: 1. Value of bits 4 to 0 .
2. Lower 16 bits of the address.
3. Initial value depends on the mode.

## Port G Data Direction Register (PGDDR)

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | PG4DDR | PG3DDR | PG2DDR | PG1DDR | PGODDR |
| Modes 1, 4, 5 |  |  |  |  |  |  |  |  |
| Initial value | Undefined | Undefined | defined | 1 | 0 | 0 | 0 | 0 |
| R/W | - | - | - | W | W | W | W | W |
| Modes 2, 3, 6, 7 |  |  |  |  |  |  |  |  |
| Initial value | Undefined | Undefined | defined | 0 | 0 | 0 | 0 | 0 |
| R/W | - | - | - | W | W | W | W | W |

PGDDR is an 8-bit write-only register, the individual bits of which specify input or output for the pins of port G. PGDDR cannot be read, and bits 7 to 5 are reserved. If PGDDR is read, an undefined value will be read. PGDDR cannot be modified.

This register is a write-only register, and cannot be written by bit manipulation instruction. For details, see section 2.10.4, Access Methods for Registers with Write-Only Bits.

PGDDR is initialized by a power-on reset, and in hardware standby mode, to H'10 (bits 4 to 0 ) in modes 1,4 , and 5 , and to $\mathrm{H}^{\prime} 00$ (bits 4 to 0 ) in modes $2,3,6$, and 7 . It retains its prior state after a manual reset, and in software standby mode. The OPE bit in SBYCR is used to select whether the bus control output pins retain their output state or become high-impedance when a transition is made to software standby mode.

Note: Modes 2, 3, 6, and 7 cannot be used in the H8S/2240.

- Modes 1, 2, 4, 5, and 6

Pins $\mathrm{PG}_{4}$ to $\mathrm{PG}_{1}$ function as bus control output pins ( $\overline{\mathrm{CS} 0}$ to $\overline{\mathrm{CS} 3}$ ) when the corresponding PGDDR bits are set to 1 , and as input ports when the bits are cleared to 0 .
Pin $\mathrm{PG}_{0}$ is an output port when the corresponding PGDDR bit is set to 1 , and an input port when the bit is cleared to 0 .

Note: Modes 2 and 6 cannot be used in the H8S/2240.

- Modes 3 and 7

Setting a PGDDR bit to 1 makes the corresponding port G pin an output port, while clearing the bit to 0 makes the pin an input port.

Note: Modes 3 and 7 cannot be used in the H8S/2240.

## Port G Data Register (PGDR)

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | PG4DR | PG3DR | PG2DR | PG1DR | PGODR |
| Initial value | Undefined Undefined Undefined |  |  | 0 | 0 | 0 | 0 | 0 |
| R/W | - | - | - | R/W | R/W | R/W | R/W | R/W |

PGDR is an 8 -bit readable/writable register that stores output data for the port G pins $\left(\mathrm{PG}_{4}\right.$ to $\left.\mathrm{PG}_{0}\right)$.
Bits 7 to 5 are reserved; they return an undetermined value if read, and cannot be modified.
PGDR is initialized to $\mathrm{H}^{\prime} 00$ (bits 4 to 0 ) by a power-on reset, and in hardware standby mode. It retains its prior state after a manual reset, and in software standby mode.

## Port G Register (PORTG)

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | PG4 | PG3 | PG2 | PG1 | PG0 |
| Initial value | Undefin | defin | defin | -* | * | —* | -* | —* |
| R/W | - | - | - | R | R | R | R | R |

Note: * Determined by state of pins $\mathrm{PG}_{4}$ to $\mathrm{PG}_{0}$.

PORTG is an 8-bit read-only register that shows the pin states. It cannot be written to. Writing of output data for the port $G$ pins $\left(\mathrm{PG}_{4}\right.$ to $\left.\mathrm{PG}_{0}\right)$ must always be performed on PGDR.

Bits 7 to 5 are reserved; they return an undetermined value if read, and cannot be modified.
If a port $G$ read is performed while PGDDR bits are set to 1 , the PGDR values are read. If a port $G$ read is performed while PGDDR bits are cleared to 0 , the pin states are read.

After a power-on reset and in hardware standby mode, PORTG contents are determined by the pin states, as PGDDR and PGDR are initialized. PORTG retains its prior state after a manual reset, and in software standby mode.

### 8.13.3 Pin Functions

Port G pins also function as bus control signal output pins ( $\overline{\mathrm{CS} 0}$ to $\overline{\mathrm{CS}}$ ) the $\mathrm{A} / \mathrm{D}$ converter input pin ( $\overline{\mathrm{ADTRG}}$ ), and interrupt input pins ( $\overline{\mathrm{IRQ6}}, \overline{\mathrm{IRQ7}}$ ). The pin functions are different in modes 1 and 2 , modes 3 and 7 , and modes 4 to 6 . Port G pin functions are shown in table 8.24.

Table 8.24 Port G Pin Functions
Pin Selection Method and Pin Functions
$\mathrm{PG}_{4} / \overline{\mathrm{CSO}} \quad$ The pin function is switched as shown below according to the operating mode and bit PG4DDR.

| Operating <br> Mode | Modes 1, 2, 4, 5, 6* |  | Modes 3 and 7* |  |
| :--- | :---: | :---: | :---: | :---: |
| PG4DDR | 0 | 1 | 0 | 1 |
| Pin function | $\mathrm{PG}_{4}$ input pin | $\overline{\mathrm{CSO}}$ output pin | $\mathrm{PG}_{4}$ input pin | $\mathrm{PG}_{4}$ output pin |

Note: * Modes 2, 3, 6, and 7 cannot be used in the H8S/2240.
$\overline{\mathrm{PG}_{3} / \overline{\mathrm{CS1}}}$
The pin function is switched as shown below according to the operating mode and bit PG3DDR.

| Operating <br> Mode | Modes 1, 2, 3, 7* |  | Modes 4 to 6* |  |
| :--- | :---: | :---: | :---: | :---: |
| PG3DDR | 0 | 1 | 0 | 1 |
| Pin function | $\mathrm{PG}_{3}$ input pin | $\mathrm{PG}_{3}$ output pin | $\mathrm{PG}_{3}$ input pin | $\overline{\mathrm{CS}}$ output pin |

Note: * Modes 2, 3, 6, and 7 cannot be used in the H8S/2240.
The pin function is switched as shown below according to the operating mode and bit PG2DDR.

| Operating <br> Mode | Modes 1, 2, 3, 7* |  | Modes 4 to 6* |  |
| :--- | :---: | :---: | :---: | :---: |
| PG2DDR | 0 | 1 | 0 | 1 |
| Pin function | $\mathrm{PG}_{2}$ input pin | $\mathrm{PG}_{2}$ output pin | $\mathrm{PG}_{2}$ input pin | $\overline{\mathrm{CS}}$ output pin |

Note: * Modes 2, 3, 6, and 7 cannot be used in the H8S/2240.
Pin Selection Method and Pin Functions
$\overline{\mathrm{PG}} / \overline{\mathrm{CS}} / \overline{\mathrm{IRQ}} \quad$ The pin function is switched as shown below according to the combination of operating mode and bit PG1DDR.

| Operating <br> Mode | Modes 1, 2, 3, $7 *^{2}$ |  | Modes 4 to $6 *^{2}$ |  |
| :--- | :---: | :---: | :---: | :---: |
| PG1DDR | 0 | 1 | 0 | 1 |
| Pin function | PG input pin | PG $_{1}$ output pin | PG $_{1}$ input pin | $\overline{\text { CS3 }}$ output pin |
|  | IRQ7 interrupt input pin* ${ }^{1}$ |  |  |  |

Notes: 1. When this pin is used as an external interrupt input, it should not be used as an input/output pin with other functions.
2. Modes 2, 3, 6, and 7 cannot be used in the H8S/2240.
$\mathrm{PG}_{0} / \overline{\mathrm{ADTRG}} / \overline{\mathrm{IRQ} 6}$ The pin function is switched as shown below according to the combination of bits TRGS1 and TRGS0 in the A/D ADCR and bit PGODDR.

| PGODDR | 0 | 1 |
| :--- | :---: | :---: |
| Pin function | PG $_{0}$ input | PG $_{0}$ output |
|  | $\overline{\text { ADTRG input pin*¹ }}$ |  |
|  | $\overline{\text { IRQ6 interrupt input pin* }}{ }^{2}$ |  |

Notes: 1. $\overline{\text { ADTRG }}$ input when TRGS0 $=$ TRGS1 $=1$.
2. When this pin is used as an external interrupt input, it should not be used as an input/output pin with other functions.

### 8.14 Handling of Unused Pins

Unused input pins should be fixed high or low. Generally, the input pins of CMOS products are high-impedance. Leaving unused pins open can cause the generation of intermediate levels due to peripheral noise induction. This can result in shoot-through current inside the device and cause it to malfunction. Table 8.25 lists examples of ways to handle unused pins.

Table 8.25 Examples of Ways to Handle Unused Input Pins
Port Name Pin Handling Example

Port $1 \quad$ Connect each pin to Vcc (pull-up) or to Vss (pull-down) via a resistor.

## Port 2

Port 3
Port 4 Connect each pin to AVcc (pull-up) or to AVss (pull-down) via a resistor.
Port 5 Connect each pin to Vcc (pull-up) or to Vss (pull-down) via a resistor.

## Section 9 16-Bit Timer Pulse Unit (TPU)

### 9.1 Overview

The H8S/2245 Group has an on-chip 16-bit timer pulse unit (TPU) that comprises three 16-bit timer channels.

### 9.1.1 Features

- Maximum 8-pulse input/output
- A total of 8 timer general registers (TGRs) are provided (four for channel 0 and two each for channels 1 , and 2 ), each of which can be set independently as an output compare/input capture register
TGRC and TGRD for channel 0 can also be used as buffer registers
- Selection of 7 or 8 counter input clocks for each channel
- The following operations can be set for each channel:
- Waveform output at compare match: Selection of 0,1 , or toggle output
- Input capture function: Selection of rising edge, falling edge, or both edge detection
- Counter clear operation: Counter clearing possible by compare match or input capture
- Synchronous operation: Multiple timer counters (TCNT) can be written to simultaneously Simultaneous clearing by compare match and input capture possible
Register simultaneous input/output possible by counter synchronous operation
- PWM mode: Any PWM output duty can be set

Maximum of 7-phase PWM output possible by combination with synchronous operation

- Buffer operation settable for channel 0
- Input capture register double-buffering possible
- Automatic rewriting of output compare register possible
- Phase counting mode settable independently for each of channels 1 , and 2
- Two-phase encoder pulse up/down-count possible
- Fast access via internal 16-bit bus
- Fast access is possible via a 16-bit bus interface
- 13 interrupt sources
- For channel 0 four compare match/input capture dual-function interrupts and one overflow interrupt can be requested independently
- For channels 1, and 2, two compare match/input capture dual-function interrupts, one overflow interrupt, and one underflow interrupt can be requested independently
- Automatic transfer of register data
- Block transfer, 1-word data transfer, and 1-byte data transfer possible by data transfer controller (DTC) activation
- A/D converter conversion start trigger can be generated
- Channel 2 to 0 compare match $\mathrm{A} /$ input capture A signals can be used as $\mathrm{A} / \mathrm{D}$ converter conversion start trigger
- Module stop mode can be set
- As the initial setting, TPU operation is halted. Register access is enabled by exiting module stop mode.

Table 9.1 lists the functions of the TPU.

Table 9.1 TPU Functions (1)

|  | Timer status register 2 | TSR2 | $\mathrm{R} /(\mathrm{W})$ * $^{2}$ | H'C0 | H'FFF5 |
|  | Timer counter 2 | TCNT2 | R/W | H'0000 | H'FFF6 |
|  | Timer general register 2A | TGR2A | R/W | H'FFFF | H'FFF8 |
|  | Timer general register 2B | TGR2B | R/W | H'FFFF | H'FFFA |

Section 9 16-Bit Timer Pulse Unit (TPU)

| Channel | Name | Abbreviation | R/W | Initial Value | Address*1 |
| :---: | :---: | :---: | :---: | :---: | :---: |
| All | Timer start register | TSTR | R/W | H'00 | H'FFC0 |
|  | Timer synchro register | TSYR | R/W | H'00 | H'FFC1 |
|  | Module stop control register | MSTPCR | R/W | H'3FFF | H'FF3C |

Notes: 1. Lower 16 bits of the address.
2. Can only be written with 0 for flag clearing.

### 9.2 Register Descriptions

### 9.2.1 Timer Control Register (TCR)

Channel 0: TCRO

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | CCLR2 | CCLR1 | CCLR0 | CKEG1 | CKEGO | TPSC2 | TPSC1 | TPSC0 |
| Initial value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

Channel 1: TCR1
Channel 2: TCR2

| Bit | 7 | 6 | 5 | 4 | 2 |  | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | CCLR1 | CCLRO | CKEG1 | CKEGO | TPSC2 | TPSC1 | TPSC0 |
| Initial value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | - | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

The TCR registers are 8 -bit registers that control the TCNT channels. The TPU has three TCR registers, one for each of channels 0 to 2 . The TCR registers are initialized to $\mathrm{H}^{\prime} 00$ by a reset, and in hardware standby mode.

TCNT operation should be stopped when making TCR settings.

Bits 7, 6, 5-Counter Clear 2, 1, and $\mathbf{0}$ (CCLR2, CCLR1, CCLR0): These bits select the TCNT counter clearing source.

| Channel | Bit 7 | Bit 6 | Bit 5 | Description |
| :---: | :---: | :---: | :---: | :---: |
|  | CCLR2 | CCLR1 | CCLRO |  |
| 0 | 0 | 0 | 0 | TCNT clearing disabled (Initial value) |
|  |  |  | 1 | TCNT cleared by TGRA compare match/input capture |
|  |  | 1 | 0 | TCNT cleared by TGRB compare match/input capture |
|  |  |  | 1 | TCNT cleared by counter clearing for another channel performing synchronous clearing/synchronous operation* |
|  | 1 | 0 | 0 | TCNT clearing disabled |
|  |  |  | 1 | TCNT cleared by TGRC compare match/input capture* ${ }^{2}$ |
|  |  | 1 | 0 | TCNT cleared by TGRD compare match/input capture*2 |
|  |  |  | 1 | TCNT cleared by counter clearing for another channel performing synchronous clearing/synchronous operation* |

| Channel | Bit 7 | Bit 6 | Bit 5 | Description |
| :---: | :---: | :---: | :---: | :---: |
|  | Reserved** | CCLR1 | CCLRO |  |
| 1,2 | 0 | 0 | 0 | TCNT clearing disabled (Initial value) |
|  |  |  | 1 | TCNT cleared by TGRA compare match/input capture |
|  |  | 1 | 0 | TCNT cleared by TGRB compare match/input capture |
|  |  |  | 1 | TCNT cleared by counter clearing for another channel performing synchronous clearing/ synchronous operation*' |

Notes: 1. Synchronous operation setting is performed by setting the SYNC bit in TSYR to 1.
2. When TGRC or TGRD is used as a buffer register, TCNT is not cleared because the buffer register setting has priority, and compare match/input capture does not occur.
3. Bit 7 is reserved in channels 1 and 2 . It is always read as 0 and cannot be modified.

Bits 4 and 3-Clock Edge 1 and 0 (CKEG1, CKEG0): These bits select the input clock edge. When a both-edges count is selected, a clock divided by two from the input clock can be selected. (e.g. $\phi / 4$ both edges $=\phi / 2$ rising edge). If phase counting mode is used on channels 1 , and 2 , this setting is ignored and the phase counting mode setting has priority.

| Bit $\mathbf{4}$ | Bit 3 |  |  |
| :--- | :--- | :--- | :--- | :--- |
| CKEG1 | CKEG0 | Description | (Initial value) |
| 0 | 0 | Count at rising edge |  |
|  | 1 | Count at falling edge |  |
| 1 | - | Count at both edges |  |

Note: Internal clock edge selection is valid when the input clock is $\phi / 4$ or slower. If $\phi / 1$ is selected as the input clock, this setting is ignored and count at falling edge of $\phi$ is selected.

Bits 2, 1, and 0-Time Prescaler 2, 1, and 0 (TPSC2 to TPSC0): These bits select the TCNT counter clock. The clock source can be selected independently for each channel. Table 9.4 shows the clock sources that can be set for each channel.

## Table 9.4 TPU Clock Sources

|  | Internal Clock |  |  |  |  |  | External Clock |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Channel | $\phi / 1$ | \$/4 | \$/16 | \$/64 | \$/256 | ¢/1024 | TCLKA | TCLKB | TCLKC | TCLKD |
| 0 | $\bigcirc$ | $\bigcirc$ | $\bigcirc$ | $\bigcirc$ |  |  | $\bigcirc$ | $\bigcirc$ | $\bigcirc$ | $\bigcirc$ |
| 1 | $\bigcirc$ | $\bigcirc$ | $\bigcirc$ | $\bigcirc$ | $\bigcirc$ |  | $\bigcirc$ | $\bigcirc$ |  |  |
| 2 | $\bigcirc$ | $\bigcirc$ | $\bigcirc$ | $\bigcirc$ |  | $\bigcirc$ | $\bigcirc$ | $\bigcirc$ | $\bigcirc$ |  |

Legend:
O: Setting
Blank: No setting

| Channel | Bit 2 | Bit 1 | Bit 0 | Description |
| :---: | :---: | :---: | :---: | :---: |
|  | TPSC2 | TPSC1 | TPSC0 |  |
| 0 | 0 | 0 | 0 | Internal clock: counts on $\phi / 1$ (Initial value) |
|  |  |  | 1 | Internal clock: counts on $\phi / 4$ |
|  |  | 1 | 0 | Internal clock: counts on $\phi / 16$ |
|  |  |  | 1 | Internal clock: counts on $\phi / 64$ |
|  | 1 | 0 | 0 | External clock: counts on TCLKA pin input |
|  |  |  | 1 | External clock: counts on TCLKB pin input |
|  |  | 1 | 0 | External clock: counts on TCLKC pin input |
|  |  |  | 1 | External clock: counts on TCLKD pin input |
|  | Bit 2 | Bit 1 | Bit 0 |  |
| Channel | TPSC2 | TPSC1 | TPSC0 | Description |
| 1 | 0 | 0 | 0 | Internal clock: counts on $\phi / 1 \quad$ (Initial value) |
|  |  |  | 1 | Internal clock: counts on $\phi / 4$ |
|  |  | 1 | 0 | Internal clock: counts on $\phi / 16$ |
|  |  |  | 1 | Internal clock: counts on $\phi / 64$ |
|  | 1 | 0 | 0 | External clock: counts on TCLKA pin input |
|  |  |  | 1 | External clock: counts on TCLKB pin input |
|  |  | 1 | 0 | Internal clock: counts on $\phi / 256$ |
|  |  |  | 1 | Setting prohibited |

Note: This setting is ignored when channel 1 is in phase counting mode.

| Channel | $\frac{\text { Bit } 2}{\text { TPSC2 }}$ | $\begin{aligned} & \text { Bit } 1 \\ & \hline \text { TPSC1 } \end{aligned}$ | $\begin{aligned} & \text { Bit } 0 \\ & \hline \text { TPSC0 } \end{aligned}$ | Description |
| :---: | :---: | :---: | :---: | :---: |
|  |  |  |  |  |
| 2 | 0 | 0 | 0 | Internal clock: counts on $\phi / 1 \quad$ (Initial value) |
|  |  |  | 1 | Internal clock: counts on $\phi / 4$ |
|  |  | 1 | 0 | Internal clock: counts on $\phi / 16$ |
|  |  |  | 1 | Internal clock: counts on $\phi / 64$ |
|  | 1 | 0 | 0 | External clock: counts on TCLKA pin input |
|  |  |  | 1 | External clock: counts on TCLKB pin input |
|  |  | 1 | 0 | External clock: counts on TCLKC pin input |
|  |  |  | 1 | Internal clock: counts on $\phi / 1024$ |

Note: This setting is ignored when channel 2 is in phase counting mode.

### 9.2.2 Timer Mode Register (TMDR)

## Channel 0: TMDRO

| Bit | $:$ | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | - | - | BFB | BFA | MD3 | MD2 | MD1 | MD0 |
| Initial value | $:$ | 1 | 1 | 0 | 0 | 0 | 0 | 0 | 0 |
|  | $:$ | - | - | R/W | R/W | R/W | R/W | R/W | R/W |

## Channel 1: TMDR1

Channel 2: TMDR2

| Bit | $:$ | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | - | - | - | - | MD3 | MD2 | MD1 | MD0 |
| Initial value | $:$ | 1 | 1 | 0 | 0 | 0 | 0 | 0 | 0 |
|  | $:$ | - | - | - | - | R/W | R/W | R/W | R/W |

The TMDR registers are 8 -bit readable/writable registers that are used to set the operating mode for each channel. The TPU has three TMDR registers, one for each channel. The TMDR registers are initialized to $\mathrm{H}^{\prime} \mathrm{C} 0$ by a reset, and in hardware standby mode.

TCNT operation should be stopped when making TMDR settings.
Bits 7 and 6-Reserved: Read-only bits, always read as 1.
Bit 5-Buffer Operation B (BFB): Specifies whether TGRB is to operate in the normal way, or TGRB and TGRD are to be used together for buffer operation. When TGRD is used as a buffer register, TGRD input capture/output compare is not generated.

In channels 1 and 2 , which have no TGRD, bit 5 is reserved. It is always read as 0 and cannot be modified.

Bit 5

| BFB | Description |  |
| :--- | :--- | :--- |
| 0 | TGRB operates normally | (Initial value) |
| 1 | TGRB and TGRD used together for buffer operation |  |

Bit 4-Buffer Operation A (BFA): Specifies whether TGRA is to operate in the normal way, or TGRA and TGRC are to be used together for buffer operation. When TGRC is used as a buffer register, TGRC input capture/output compare is not generated.

In channels 1 , and 2 , which have no TGRC, bit 4 is reserved. It is always read as 0 and cannot be modified.

Bit 4

| BFA | Description |  |
| :--- | :--- | :--- |
| 0 | TGRA operates normally | (Initial value) |
| 1 | TGRA and TGRC used together for buffer operation |  |

Bits 3 to 0—Modes $\mathbf{3}$ to $\mathbf{0}$ (MD3 to MD0): These bits are used to set the timer operating mode.

| Bit 3 | Bit 2 | Bit 1 | Bit 0 |  |
| :--- | :--- | :--- | :--- | :--- |
| MD3* ${ }^{1}$ | MD2 $^{* 2}$ | MD1 | MD0 | Description |

| 0 | 0 | 0 | 0 | Normal operation | (Initial value) |
| :--- | :--- | :--- | :--- | :--- | :--- |
|  |  | 1 | Reserved |  |  |
|  |  |  | 0 | PWM mode 1 |  |
|  |  | 0 | 0 | PWM mode 2 |  |
|  |  | 1 | Phase counting mode 1 |  |  |
|  |  | 0 | Phase counting mode 2 |  |  |
|  |  | $*$ | $*$ | - | Phase counting mode 4 |
|  |  |  |  |  |  |
|  |  |  |  |  |  |

Legend: *: Don't care
Notes: 1. MD3 is a reserved bit. In a write, it should always be written with 0 .
2. Phase counting mode cannot be set for channel 0 . In this case, 0 should always be written to MD2.

### 9.2.3 Timer I/O Control Register (TIOR)

## Channel 0: TIOROH

Channel 1: TIOR1
Channel 2: TIOR2

| Bit | $:$ | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | IOB3 | IOB2 | IOB1 | IOB0 | IOA3 | IOA2 | IOA1 | IOA0 |  |
|  | Initial value | $:$ | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | $:$ | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

## Channel 0: TIOROL

| Bit | $:$ | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | IOD3 | IOD2 | IOD1 | IOD0 | IOC3 | IOC2 | IOC1 | IOC0 |  |
|  | Initial value | $:$ | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | $:$ | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

Note: When TGRC or TGRD is designated for buffer operation, this setting is invalid and the register operates as a buffer register.

The TIOR registers are 8 -bit registers that control the TGR registers. The TPU has four TIOR registers, two for channel 0 and one each for channels 1 , and 2. The TIOR registers are initialized to $\mathrm{H}^{\prime} 00$ by a reset, and in hardware standby mode.

Care is required since TIOR is affected by the TMDR setting. The initial output specified by TIOR is valid when the counter is stopped (the CST bit in TSTR is cleared to 0). Note also that, in PWM mode 2 , the output at the point at which the counter is cleared to 0 is specified.

Bits 7 to 4-I/O Control B3 to B0 (IOB3 to IOB0)
I/O Control D3 to D0 (IOD3 to IOD0):
Bits IOB3 to IOB0 specify the function of TGRB.
Bits IOD3 to IOD0 specify the function of TGRD.

### 9.2.4 Timer Interrupt Enable Register (TIER)

## Channel 0: TIERO

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | TTGE | - | - | TCIEV | TGIED | TGIEC | TGIEB | TGIEA |
| Initial value | 0 | 1 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | - | - | R/W | R/W | R/W | R/W | R/W |

Channel 1: TIER1

## Channel 2: TIER2

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | TTGE | - | TCIEU | TCIEV | - | - | TGIEB | TGIEA |
| Initial value | 0 | 1 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | - | R/W | R/W | - | - | R/W | R/W |

The TIER registers are 8 -bit registers that control enabling or disabling of interrupt requests for each channel. The TPU has three TIER registers, one for each channel. The TIER registers are initialized to H'40 by a reset, and in hardware standby mode.

Bit 7—A/D Conversion Start Request Enable (TTGE): Enables or disables generation of A/D conversion start requests by TGRA input capture/compare match.

Bit 7

| TTGE | Description |  |
| :--- | :--- | :--- |
| 0 | A/D conversion start request generation disabled | (Initial value) |
| 1 | A/D conversion start request generation enabled |  |

Bit 6-Reserved: Read-only bit, always read as 1.

Bit 5-Underflow Interrupt Enable (TCIEU): Enables or disables interrupt requests (TCIU) by the TCFU flag when the TCFU flag in TSR is set to 1 in channels 1 and 2.

In channel 0 bit 5 is reserved. It is always read as 0 and cannot be modified.
Bit 5
TCIEU Description

| 0 | Interrupt requests (TCIU) by TCFU disabled | (Initial value) |
| :--- | :--- | :---: |
| 1 | Interrupt requests (TCIU) by TCFU enabled |  |

Bit 4-Overflow Interrupt Enable (TCIEV): Enables or disables interrupt requests (TCIV) by the TCFV flag when the TCFV flag in TSR is set to 1 .

Bit 4

| TCIEV | Description |  |
| :--- | :--- | :--- |
| 0 | Interrupt requests (TCIV) by TCFV disabled | (Initial value) |
| 1 | Interrupt requests (TCIV) by TCFV enabled |  |

Bit 3-TGR Interrupt Enable D (TGIED): Enables or disables interrupt requests (TGID) by the TGFD bit when the TGFD bit in TSR is set to 1 in channel 0 .

In channels 1 , and 2 , bit 3 is reserved. It is always read as 0 and cannot be modified.

## Bit 3

TGIED Description

| 0 | Interrupt requests (TGID) by TGFD bit disabled | (Initial value) |
| :--- | :--- | :---: |
| 1 | Interrupt requests (TGID) by TGFD bit enabled |  |

Bit 2-TGR Interrupt Enable C (TGIEC): Enables or disables interrupt requests (TGIC) by the TGFC bit when the TGFC bit in TSR is set to 1 in channel 0 .

In channels 1 , and 2 , bit 2 is reserved. It is always read as 0 and cannot be modified.
Bit 2

| TGIEC | Description |  |
| :--- | :--- | :--- |
| 0 | Interrupt requests (TGIC) by TGFC bit disabled | (Initial value) |
| 1 | Interrupt requests (TGIC) by TGFC bit enabled |  |

Bit 1—TGR Interrupt Enable B (TGIEB): Enables or disables interrupt requests (TGIB) by the TGFB bit when the TGFB bit in TSR is set to 1 .

Bit 1
TGIEB Description

| 0 | Interrupt requests (TGIB) by TGFB bit disabled | (Initial value) |
| :--- | :--- | :---: |
| 1 | Interrupt requests (TGIB) by TGFB bit enabled |  |

Bit 0-TGR Interrupt Enable A (TGIEA): Enables or disables interrupt requests (TGIA) by the TGFA bit when the TGFA bit in TSR is set to 1 .

Bit 0
TGIEA Description

| 0 | Interrupt requests (TGIA) by TGFA bit disabled | (Initial value) |
| :--- | :--- | :---: |
| 1 | Interrupt requests (TGIA) by TGFA bit enabled |  |

### 9.2.5 Timer Status Register (TSR)

## Channel 0: TSRO

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | TCFV | TGFD | TGFC | TGFB | TGFA |
| Initial value | 1 | 1 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | - | - | - | R/(W)* | $\mathrm{R} / \mathrm{W})^{*}$ | R/(W)* | $\mathrm{R} / \mathrm{W})^{*}$ | R/(W)* |

Note: * Can only be written with 0 for flag clearing.

## Channel 1: TSR1

Channel 2: TSR2

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | TCFD | - | TCFU | TCFV | - | - | TGFB | TGFA |
| Initial value | 1 | 1 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | - | R/(W)* | R/(W)* | - | - | $\mathrm{R} /(\mathrm{W})^{*}$ | $\mathrm{R} /(\mathrm{W})^{*}$ |

Note: * Can only be written with 0 for flag clearing.

The TSR registers are 8 -bit registers that indicate the status of each channel. The TPU has three TSR registers, one for each channel. The TSR registers are initialized to H'C0 by a reset, and in hardware standby mode.

Bit 7—Count Direction Flag (TCFD): Status flag that shows the direction in which TCNT counts in channels 1 , and 2.

In channel 0 bit 7 is reserved. It is always read as 1 and cannot be modified.

| $\frac{\text { Bit } 7}{}$ |  |  |
| :--- | :--- | :--- |
| TCFD | Description |  |
| 0 | TCNT counts down | (Initial value) |
| 1 | TCNT counts up |  |

Bit 6-Reserved: Read-only bit, always read as 1.
Bit 5-Underflow Flag (TCFU): Status flag that indicates that TCNT underflow has occurred when channels 1 and 2 are set to phase counting mode.

In channel 0 bit 5 is reserved. It is always read as 0 and cannot be modified.

| Bit $\mathbf{5}$ |  |  |
| :--- | :--- | :--- |
| TCFU | Description | (Initial value) |
| 0 | [Clearing condition] |  |
|  | When 0 is written to TCFU after reading TCFU $=1$ |  |
| 1 | [Setting condition] | When the TCNT value underflows (changes from H'0000 to H'FFFF) |

Bit 4—Overflow Flag (TCFV): Status flag that indicates that TCNT overflow has occurred.

## Bit 4

| TCFV | Description | (Initial value) |
| :--- | :--- | :--- |
| 0 | [Clearing condition] |  |
|  | When 0 is written to TCFV after reading TCFV =1 |  |
| 1 | [Setting condition] |  |
|  | When the TCNT value overflows (changes from H'FFFF to H'0000) |  |

Bit 3—Input Capture/Output Compare Flag D (TGFD): Status flag that indicates the occurrence of TGRD input capture or compare match in channel 0 .

In channels 1 , and 2, bit 3 is reserved. It is always read as 0 and cannot be modified.
Bit 3

| TGFD | Description |
| :--- | :--- | :--- |
| 0 | [Clearing conditions] |
|  | - When DTC is activated by TGID interrupt while DISEL bit of MRB in DTC is 0 with |
|  | the transfer counter not being 0 |
|  | - When 0 is written to TGFD after reading TGFD = 1 |
| 1 | [Setting conditions] |
|  | $\bullet \quad$ When TCNT = TGRD while TGRD is functioning as output compare register |
|  | - When TCNT value is transferred to TGRD by input capture signal while TGRD is |
|  |  |
|  | functioning as input capture register |

Bit 2—Input Capture/Output Compare Flag C (TGFC): Status flag that indicates the occurrence of TGRC input capture or compare match in channel 0.

In channels 1 , and 2, bit 2 is reserved. It is always read as 0 and cannot be modified.

## Bit 2

TGFC Description
$0 \quad$ [Clearing conditions]

- When DTC is activated by TGIC interrupt while DISEL bit of MRB in DTC is 0 with the transfer counter not being 0
- When 0 is written to TGFC after reading TGFC = 1
[Setting conditions]
- When TCNT = TGRC while TGRC is functioning as output compare register
- When TCNT value is transferred to TGRC by input capture signal while TGRC is functioning as input capture register

Bit 1—Input Capture/Output Compare Flag B (TGFB): Status flag that indicates the occurrence of TGRB input capture or compare match.

## Bit 1

TGFB Description
$0 \quad$ [Clearing conditions] $\quad$ (Initial value)

- When DTC is activated by TGIB interrupt while DISEL bit of MRB in DTC is 0 with the transfer counter not being 0
- When 0 is written to TGFB after reading TGFB $=1$

1 [Setting conditions]

- When TCNT = TGRB while TGRB is functioning as output compare register
- When TCNT value is transferred to TGRB by input capture signal while TGRB is functioning as input capture register

Bit 0-Input Capture/Output Compare Flag A (TGFA): Status flag that indicates the occurrence of TGRA input capture or compare match.

Bit 0
TGFA Description

0
[Clearing conditions]
(Initial value)

- When DTC is activated by TGIA interrupt while DISEL bit of MRB in DTC is 0 with the transfer counter not being 0
- When 0 is written to TGFA after reading TGFA $=1$
[Setting conditions]
- When TCNT = TGRA while TGRA is functioning as output compare register
- When TCNT value is transferred to TGRA by input capture signal while TGRA is functioning as input capture register

### 9.2.6 Timer Counter (TCNT)

## Channel 0: TCNTO (up-counter) <br> Channel 1: TCNT1 (up/down-counter*) <br> Channel 2: TCNT2 (up/down-counter*)

Bit

Initial value :

| 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
|  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

R/W : R/W R/W R/W R/W R/W R/W R/W R/W R/W R/W R/W R/W R/W R/W R/W R/W

Note: * These counters can be used as up/down-counters only in phase counting mode. In other cases they function as up-counters.

The TCNT registers are 16-bit counters. The TPU has three TCNT counters, one for each channel.

The TCNT counters are initialized to H'0000 by a reset, and in hardware standby mode.

The TCNT counters cannot be accessed in 8-bit units; they must always be accessed as a 16-bit unit.

### 9.2.7 Timer General Register (TGR)

R/W : R/W R/W R/W R/W R/W R/W R/W R/W R/W R/W R/W R/W R/W R/W R/W R/W

The TGR registers are 16-bit registers with a dual function as output compare and input capture registers. The TPU has 8 TGR registers, four for channel 0 and two each for channels 1 , and 2. TGRC and TGRD for channel 0 can also be designated for operation as buffer registers*. The TGR registers are initialized to H'FFFF by a reset, and in hardware standby mode.

The TGR registers cannot be accessed in 8-bit units; they must always be accessed as a 16-bit unit.
Note: * TGR buffer register combinations are TGRA—TGRC and TGRB——TGRD.

### 9.2.8 Timer Start Register (TSTR)

| Bit | $:$ |
| :--- | :---: |
|  | 7 |
|  | 7 |

TSTR is an 8-bit readable/writable register that selects operation/stoppage for channels 0 to 2 .
TSTR is initialized to $\mathrm{H}^{\prime} 00$ by a reset, and in hardware standby mode.

TCNT counter operation should be stopped when setting the operating mode in TMDR or the TCNT count clock in TCR.

Bits 7 and 3—Reserved: Should always be written with 0.

Bits 2 to 0—Counter Start 2 to 0 (CST2 to CST0): These bits select operation or stoppage for TCNT.

Bit n

| CSTn | Description |  |
| :--- | :--- | :--- |
| 0 | TCNTn count operation is stopped | (Initial value) |
| 1 | TCNTn performs count operation |  |
| $\mathrm{n}=2$ to 0 |  |  |

Note: If 0 is written to the CST bit during operation with the TIOC pin designated for output, the counter stops but the TIOC pin output compare output level is retained. If TIOR is written to when the CST bit is cleared to 0 , the pin output level will be changed to the set initial output value.

### 9.2.9 Timer Synchro Register (TSYR)

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | - | - | SYNC2 | SYNC1 | SYNC0 |
| Initial value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | - | - | - | - | - | R/W | R/W | R/W |

TSYR is an 8-bit readable/writable register that selects independent operation or synchronous operation for the channel 0 to 2 TCNT counters. A channel performs synchronous operation when the corresponding bit in TSYR is set to 1 .

TSYR is initialized to $\mathrm{H}^{\prime} 00$ by a reset, and in hardware standby mode.
Bits 7 and 3—Reserved: Should always be written with 0 .
Bits 2 to 0-Timer Synchro 2 to 0 (SYNC2 to SYNC0): These bits select whether operation is independent of or synchronized with other channels.

When synchronous operation is selected, synchronous presetting of multiple channels*1 ${ }^{1}$, and synchronous clearing through counter clearing on another channel* ${ }^{2}$ are possible.

Notes: 1. To set synchronous operation, the SYNC bits for at least two channels must be set to 1 .
2. To set synchronous clearing, in addition to the SYNC bit, the TCNT clearing source must also be set by means of bits CCLR2 to CCLR0 in TCR.

Bit $n$
SYNCn Description
$0 \quad$ TCNTn operates independently (TCNT presetting/clearing is unrelated to other channels)
(Initial value)
1 TCNTn performs synchronous operation
TCNT synchronous presetting/synchronous clearing is possible
Note: $\mathrm{n}=2$ to 0

### 9.2.10 Module Stop Control Register (MSTPCR)

R/W : R/W R/W R/W R/W R/W R/W R/W R/W R/W R/W R/W R/W R/W R/W R/W R/W

MSTPCR is a 16-bit readable/writable register that performs module stop mode control.

When the MSTP13 bit in MSTPCR is set to 1, TPU operation stops at the end of the bus cycle and a transition is made to module stop mode. For details, see section 18.5, Module Stop Mode.

MSTPCR is initialized to H'3FFF by a reset and in hardware standby mode. It is not initialized in software standby mode.

Bit 13-Module Stop (MSTP13): Specifies the TPU module stop mode.
Bit 13
MSTP13 Description

| 0 | TPU module stop mode cleared |  |
| :--- | :--- | :--- |
| 1 | TPU module stop mode set | (Initial value) |

### 9.3 Interface to Bus Master

### 9.3.1 16-Bit Registers

TCNT and TGR are 16-bit registers. As the data bus to the bus master is 16 bits wide, these registers can be read and written to in 16-bit units.

These registers cannot be read or written to in 8-bit units; 16-bit access must always be used.
An example of 16-bit register access operation is shown in figure 9.2.

Figure 9.2 16-Bit Register Access Operation [Bus Master $\leftrightarrow$ TCNT (16 Bits)]

### 9.3.2 8-Bit Registers

Registers other than TCNT and TGR are 8 -bit. As the data bus to the CPU is 16 bits wide, these registers can be read and written to in 16 -bit units. They can also be read and written to in 8 -bit units.

Examples of 8 -bit register access operation are shown in figures 9.3 to 9.5 .

Figure 9.3 8-Bit Register Access Operation [Bus Master $\leftrightarrow$ TCR (Upper 8 Bits)]

Figure 9.4 8-Bit Register Access Operation [Bus Master $\leftrightarrow$ TMDR (Lower 8 Bits)]

Figure 9.5 8-Bit Register Access Operation [Bus Master $\leftrightarrow$ TCR and TMDR (16 Bits)]

### 9.4 Operation

### 9.4.1 Overview

Operation in each mode is outlined below.

## Normal Operation

Each channel has a TCNT and TGR register. TCNT performs up-counting, and is also capable of free-running operation, synchronous counting, and external event counting.

Each TGR can be used as an input capture register or output compare register.

## Synchronous Operation

When synchronous operation is designated for a channel, TCNT for that channel performs synchronous presetting. That is, when TCNT for a channel designated for synchronous operation is rewritten, the TCNT counters for the other channels are also rewritten at the same time. Synchronous clearing of the TCNT counters is also possible by setting the timer synchronization bits in TSYR for channels designated for synchronous operation.

## Buffer Operation

- When TGR is an output compare register

When a compare match occurs, the value in the buffer register for the relevant channel is transferred to TGR.

- When TGR is an input capture register When input capture occurs, the value in TCNT is transfer to TGR and the value previously held in TGR is transferred to the buffer register.

## PWM Mode

In this mode, a PWM waveform is output. The output level can be set by means of TIOR. A PWM waveform with a duty of between $0 \%$ and $100 \%$ can be output, according to the setting of each TGR register.

## Phase Counting Mode

In this mode, TCNT is incremented or decremented by detecting the phases of two clocks input from the external clock input pins in channels 1 , and 2 . When phase counting mode is set, the corresponding TCLK pin functions as the clock pin, and TCNT performs up- or down-counting.

This can be used for two-phase encoder pulse input.

### 9.4.2 Basic Functions

## Counter Operation

When one of bits CST0 to CST2 is set to 1 in TSTR, the TCNT counter for the corresponding channel starts counting. TCNT can operate as a free-running counter, periodic counter, and so on.

Example of count operation setting procedure: Figure 9.6 shows an example of the count operation setting procedure.

Figure 9.6 Example of Counter Operation Setting Procedure

Free-running count operation and periodic count operation: Immediately after a reset, the TPU's TCNT counters are all designated as free-running counters. When the relevant bit in TSTR is set to 1 the corresponding TCNT counter starts up-count operation as a free-running counter. When TCNT overflows (from H'FFFF to H'0000), the TCFV bit in TSR is set to 1 . If the value of the corresponding TCIEV bit in TIER is 1 at this point, the TPU requests an interrupt. After overflow, TCNT starts counting up again from H'0000.

Figure 9.7 illustrates free-running counter operation.

Figure 9.7 Free-Running Counter Operation
When compare match is selected as the TCNT clearing source, the TCNT counter for the relevant channel performs periodic count operation. The TGR register for setting the period is designated as an output compare register, and counter clearing by compare match is selected by means of bits CCLR2 to CCLR0 in TCR. After the settings have been made, TCNT starts up-count operation as periodic counter when the corresponding bit in TSTR is set to 1 . When the count value matches the value in TGR, the TGF bit in TSR is set to 1 and TCNT is cleared to $\mathrm{H}^{\prime} 0000$.

If the value of the corresponding TGIE bit in TIER is 1 at this point, the TPU requests an interrupt. After a compare match, TCNT starts counting up again from $\mathrm{H}^{\prime} 0000$.

Figure 9.8 illustrates periodic counter operation.

Figure 9.8 Periodic Counter Operation

## Waveform Output by Compare Match

The TPU can perform 0,1 , or toggle output from the corresponding output pin using compare match.

Example of setting procedure for waveform output by compare match: Figure 9.9 shows an example of the setting procedure for waveform output by compare match

Figure 9.9 Example Of Setting Procedure For Waveform Output By Compare Match

Examples of waveform output operation: Figure 9.10 shows an example of 0 output/1 output.
In this example TCNT has been designated as a free-running counter, and settings have been made so that 1 is output by compare match A , and 0 is output by compare match B . When the set level and the pin level coincide, the pin level does not change.

Figure 9.10 Example of $\mathbf{0}$ Output/1 Output Operation
Figure 9.11 shows an example of toggle output.
In this example TCNT has been designated as a periodic counter (with counter clearing performed by compare match B), and settings have been made so that output is toggled by both compare match A and compare match B.

Figure 9.11 Example of Toggle Output Operation

## Input Capture Function

The TCNT value can be transferred to TGR on detection of the TIOC pin input edge.

Rising edge, falling edge, or both edges can be selected as the detected edge.
Example of input capture operation setting procedure: Figure 9.12 shows an example of the input capture operation setting procedure.

Figure 9.12 Example of Input Capture Operation Setting Procedure

Example of input capture operation: Figure 9.13 shows an example of input capture operation.
In this example both rising and falling edges have been selected as the TIOCA pin input capture input edge, falling edge has been selected as the TIOCB pin input capture input edge, and counter clearing by TGRB input capture has been designated for TCNT.

Figure 9.13 Example of Input Capture Operation

### 9.4.3 Synchronous Operation

In synchronous operation, the values in a number of TCNT counters can be rewritten simultaneously (synchronous presetting). Also, a number of TCNT counters can be cleared simultaneously by making the appropriate setting in TCR (synchronous clearing).

Synchronous operation enables TGR to be incremented with respect to a single time base.
Channels 0 to 2 can all be designated for synchronous operation.

## Example of Synchronous Operation Setting Procedure

Figure 9.14 shows an example of the synchronous operation setting procedure.

Figure 9.14 Example of Synchronous Operation Setting Procedure

## Example of Synchronous Operation

Figure 9.15 shows an example of synchronous operation.
In this example, synchronous operation and PWM mode 1 have been designated for channels 0 to 2, TGR0B compare match has been set as the channel 0 counter clearing source, and synchronous clearing has been set for the channel 1 and 2 counter clearing source.

Three-phase PWM waveforms are output from pins TIOC0A, TIOC1A, and TIOC2A. At this time, synchronous presetting, and synchronous clearing by TGR0B compare match, is performed for channel 0 to 2 TCNT counters, and the data set in TGR0B is used as the PWM cycle.

For details of PWM modes, see section 9.4.5, PWM Modes.

Figure 9.15 Example of Synchronous Operation

### 9.4.4 Buffer Operation

Buffer operation, provided for channel 0 enables TGRC and TGRD to be used as buffer registers.
Buffer operation differs depending on whether TGR has been designated as an input capture register or as a compare match register.

Table 9.5 shows the register combinations used in buffer operation.
Table 9.5 Register Combinations in Buffer Operation

| Channel | Timer General Register | Buffer Register |
| :--- | :--- | :--- |
| 0 | TGR0A | TGR0C |
|  | TGR0B | TGR0D |

When TGR is an output compare register: When a compare match occurs, the value in the buffer register for the corresponding channel is transferred to the timer general register.

This operation is illustrated in figure 9.16.

Figure 9.16 Compare Match Buffer Operation
When TGR is an input capture register: When input capture occurs, the value in TCNT is transferred to TGR and the value previously held in the timer general register is transferred to the buffer register.

This operation is illustrated in figure 9.17.

Figure 9.17 Input Capture Buffer Operation

## Example of Buffer Operation Setting Procedure

Figure 9.18 shows an example of the buffer operation setting procedure.

Figure 9.18 Example of Buffer Operation Setting Procedure

## Examples of Buffer Operation

When TGR is an output compare register: Figure 9.19 shows an operation example in which PWM mode 1 has been designated for channel 0 , and buffer operation has been designated for TGRA and TGRC. The settings used in this example are TCNT clearing by compare match B, 1 output at compare match A , and 0 output at compare match B .

As buffer operation has been set, when compare match A occurs the output changes and the value in buffer register TGRC is simultaneously transferred to timer general register TGRA. This operation is repeated each time compare match A occurs.

For details of PWM modes, see section 9.4.5, PWM Modes.

Figure 9.19 Example of Buffer Operation (1)

When TGR is an input capture register: Figure 9.20 shows an operation example in which TGRA has been designated as an input capture register, and buffer operation has been designated for TGRA and TGRC.

Counter clearing by TGRA input capture has been set for TCNT, and both rising and falling edges have been selected as the TIOCA pin input capture input edge.

As buffer operation has been set, when the TCNT value is stored in TGRA upon occurrence of input capture A, the value previously stored in TGRA is simultaneously transferred to TGRC.

Figure 9.20 Example of Buffer Operation (2)

### 9.4.5 PWM Modes

In PWM mode, PWM waveforms are output from the output pins. 0,1 , or toggle output can be selected as the output level in response to compare match of each TGR.

Designating TGR compare match as the counter clearing source enables the period to be set in that register. All channels can be designated for PWM mode independently. Synchronous operation is also possible.

There are two PWM modes, as described below.

- PWM mode 1

PWM output is generated from the TIOCA and TIOCC pins by pairing TGRA with TGRB and TGRC with TGRD. The output specified by bits IOA3 to IOA0 and IOC3 to IOC0 in TIOR is output from the TIOCA and TIOCC pins at compare matches A and C, and the output specified by bits IOB3 to IOB0 and IOD3 to IOD0 in TIOR is output at compare matches B and D . The initial output value is the value set in TGRA or TGRC. If the set values of paired TGRs are identical, the output value does not change when a compare match occurs.
In PWM mode 1, a maximum 4-phase PWM output is possible.

- PWM mode 2

PWM output is generated using one TGR as the cycle register and the others as duty registers. The output specified in TIOR is performed by means of compare matches. Upon counter clearing by a synchronization register compare match, the output value of each pin is the initial value set in TIOR. If the set values of the cycle and duty registers are identical, the output value does not change when a compare match occurs.
In PWM mode 2, a maximum 7-phase PWM output is possible by combined use with synchronous operation.

The correspondence between PWM output pins and registers is shown in table 9.6.
Table 9.6 PWM Output Registers and Output Pins

| Channel | Registers | Output Pins |  |
| :---: | :---: | :---: | :---: |
|  |  | PWM Mode 1 | PWM Mode 2 |
| 0 | TGR0A | TIOCA0 | TIOCA0 |
|  | TGR0B |  | TIOCB0 |
|  | TGR0C | TIOCC0 | TIOCC0 |
|  | TGR0D |  | TIOCD0 |
| 1 | TGR1A | TIOCA1 | TIOCA1 |
|  | TGR1B |  | TIOCB1 |
| 2 | TGR2A | TIOCA2 | TIOCA2 |
|  | TGR2B |  | TIOCB2 |

Note: In PWM mode 2, PWM output is not possible for the TGR register in which the period is set.

## Example of PWM Mode Setting Procedure

Figure 9.21 shows an example of the PWM mode setting procedure.

Figure 9.21 Example of PWM Mode Setting Procedure

## Examples of PWM Mode Operation

Figure 9.22 shows an example of PWM mode 1 operation.
In this example, TGRA compare match is set as the TCNT clearing source, 0 is set for the TGRA initial output value and output value, and 1 output is set as the TGRB output value.

In this case, the value set in TGRA is used as the period, and the values set in TGRB registers as the duty.

Figure 9.22 Example of PWM Mode Operation (1)
Figure 9.23 shows an example of PWM mode 2 operation.
In this example, synchronous operation is designated for channels 0 and 1, TGR1B compare match is set as the TCNT clearing source, and 0 is set for the initial output value and 1 for the output value of the other TGR registers, to output a 5-phase PWM waveform.

In this case, the value set in TGR1B is used as the cycle, and the values set in the other TGRs as the duty.

Figure 9.23 Example of PWM Mode Operation (2)

Figure 9.24 shows examples of PWM waveform output with $0 \%$ duty and $100 \%$ duty in PWM mode.

Output does not change when cycle register and duty register compare matches occur simultaneously

Output does not change when cycle register and duty register compare matches occur simultaneously

Figure 9.24 Example of PWM Mode Operation (3)

### 9.4.6 Phase Counting Mode

In phase counting mode, the phase difference between two external clock inputs is detected and TCNT is incremented/decremented accordingly. This mode can be set for channels 1 , and 2.

When phase counting mode is set, an external clock is selected as the counter input clock and TCNT operates as an up/down-counter regardless of the setting of bits TPSC2 to TPSC0 and bits CKEG1 and CKEG0 in TCR. However, the functions of bits CCLR1 and CCLR0 in TCR, and of TIOR, TIER, and TGR are valid, and input capture/compare match and interrupt functions can be used.

When overflow occurs while TCNT is counting up, the TCFV flag in TSR is set; when underflow occurs while TCNT is counting down, the TCFU flag is set.

The TCFD bit in TSR is the count direction flag. Reading the TCFD flag provides an indication of whether TCNT is counting up or down.

Table 9.7 shows the correspondence between external clock pins and channels.
Table 9.7 Phase Counting Mode Clock Input Pins

|  | External Clock Pins |  |
| :--- | :--- | :--- |
| Channels | A-Phase | B-Phase |
| When channel 1 is set to phase counting mode | TCLKA | TCLKB |
| When channel 2 is set to phase counting mode | TCLKC | TCLKD |

## Example of Phase Counting Mode Setting Procedure

Figure 9.25 shows an example of the phase counting mode setting procedure.

Figure 9.25 Example of Phase Counting Mode Setting Procedure

## Examples of Phase Counting Mode Operation

In phase counting mode, TCNT counts up or down according to the phase difference between two external clocks. There are four modes, according to the count conditions.

Phase counting mode 1: Figure 9.26 shows an example of phase counting mode 1 operation, and table 9.8 summarizes the TCNT up/down-count conditions.

Figure 9.26 Example of Phase Counting Mode 1 Operation

## Table 9.8 Up/Down-Count Conditions in Phase Counting Mode 1

### 9.5 Interrupts

### 9.5.1 Interrupt Sources and Priorities

There are three kinds of TPU interrupt source: TGR input capture/compare match, TCNT overflow, and TCNT underflow. Each interrupt source has its own status flag and enable/disabled bit, allowing generation of interrupt request signals to be enabled or disabled individually.

When an interrupt request is generated, the corresponding status flag in TSR is set to 1 . If the corresponding enable/disable bit in TIER is set to 1 at this time, an interrupt is requested. The interrupt request is cleared by clearing the status flag to 0 .

Relative channel priorities can be changed by the interrupt controller, but the priority order within a channel is fixed. For details, see section 5, Interrupt Controller.

Table 9.12 lists the TPU interrupt sources.
Table 9.12 TPU Interrupts

| Channel | Interrupt <br> Source | Description | DTC <br> Activation | Priority |
| :---: | :---: | :---: | :---: | :---: |
| 0 | TGIOA | TGR0A input capture/compare match | Possible | High |
|  | TGIOB | TGROB input capture/compare match | Possible |  |
|  | TGIOC | TGR0C input capture/compare match | Possible |  |
|  | TGIOD | TGROD input capture/compare match | Possible |  |
|  | TCIOV | TCNT0 overflow | Not possible |  |
| 1 | TGI1A | TGR1A input capture/compare match | Possible |  |
|  | TGI1B | TGR1B input capture/compare match | Possible |  |
|  | TCI1V | TCNT1 overflow | Not possible |  |
|  | TCI1U | TCNT1 underflow | Not possible |  |
| 2 | TGI2A | TGR2A input capture/compare match | Possible |  |
|  | TGI2B | TGR2B input capture/compare match | Possible |  |
|  | TCI2V | TCNT2 overflow | Not possible |  |
|  | TCI2U | TCNT2 underflow | Not possible | Low |

Note: This table shows the initial state immediately after a reset. The relative channel priorities can be changed by the interrupt controller.

Input Capture/Compare Match Interrupt: An interrupt is requested if the TGIE bit in TIER is set to 1 when the TGF flag in TSR is set to 1 by the occurrence of a TGR input capture/compare match on a particular channel. The interrupt request is cleared by clearing the TGF flag to 0 . The TPU has 8 input capture/compare match interrupts, four for channel 0 , and two each for channels 1 , and 2.

Overflow Interrupt: An interrupt is requested if the TCIEV bit in TIER is set to 1 when the TCFV flag in TSR is set to 1 by the occurrence of TCNT overflow on a particular channel. The interrupt request is cleared by clearing the TCFV flag to 0 . The TPU has three overflow interrupts, one for each channel.

Underflow Interrupt: An interrupt is requested if the TCIEU bit in TIER is set to 1 when the TCFU flag in TSR is set to 1 by the occurrence of TCNT underflow on channel. The interrupt request is cleared by clearing the TCFU flag to 0 . The TPU has two underflow interrupts, one each for channels 1 , and 2.

### 9.5.2 DTC Activation

DTC Activation: The DTC can be activated by the TGR input capture/compare match interrupt for a channel. For details, see section 7, Data Transfer Controller.

A total of 8 TPU input capture/compare match interrupts can be used as DTC activation sources, four for channels 0 , and two each for channels 1 , and 2 .

### 9.5.3 A/D Converter Activation

The A/D converter can be activated by the TGRA input capture/compare match for a channel.
If the TTGE bit in TIER is set to 1 when the TFGA flag in TSR is set to 1 by the occurrence of a TGRA input capture/compare match on a particular channel, a request to start A/D conversion is sent to the A/D converter. If the TPU conversion start trigger has been selected on the A/D converter side at this time, A/D conversion is started.

In the TPU, a total of three TGRA input capture/compare match interrupts can be used as A/D converter conversion start sources, one for each channel.

### 9.6 Operation Timing

### 9.6.1 Input/Output Timing

## TCNT Count Timing

Figure 9.30 shows TCNT count timing in internal clock operation, and figure 9.31 shows TCNT count timing in external clock operation.

Figure 9.30 Count Timing in Internal Clock Operation

Figure 9.31 Count Timing in External Clock Operation

## Output Compare Output Timing

A compare match signal is generated in the final state in which TCNT and TGR match (the point at which the count value matched by TCNT is updated). When a compare match signal is generated, the output value set in TIOR is output at the output compare output pin (TIOC pin). After a match between TCNT and TGR, the compare match signal is not generated until the TCNT input clock is generated.

Figure 9.32 shows output compare output timing.

Figure 9.32 Output Compare Output Timing

## Input Capture Signal Timing

Figure 9.33 shows input capture signal timing.

Figure 9.33 Input Capture Input Signal Timing

## Timing for Counter Clearing by Compare Match/Input Capture

Figure 9.34 shows the timing when counter clearing by compare match occurrence is specified, and figure 9.35 shows the timing when counter clearing by input capture occurrence is specified.

Figure 9.34 Counter Clear Timing (Compare Match)

Figure 9.35 Counter Clear Timing (Input Capture)

## Buffer Operation Timing

Figures 9.36 and 9.37 show the timing in buffer operation.

Figure 9.36 Buffer Operation Timing (Compare Match)

Figure 9.37 Buffer Operation Timing (Input Capture)

### 9.6.2 Interrupt Signal Timing

## TGF Flag Setting Timing in Case of Compare Match

Figure 9.38 shows the timing for setting of the TGF flag in TSR by compare match occurrence, and TGI interrupt request signal timing.

Figure 9.38 TGI Interrupt Timing (Compare Match)

## TGF Flag Setting Timing in Case of Input Capture

Figure 9.39 shows the timing for setting of the TGF flag in TSR by input capture occurrence, and TGI interrupt request signal timing.
$\phi$

Input capture signal

TGF flag

TGI interrupt

Figure 9.39 TGI Interrupt Timing (Input Capture)

## TCFV Flag/TCFU Flag Setting Timing

Figure 9.40 shows the timing for setting of the TCFV flag in TSR by overflow occurrence, and TCIV interrupt request signal timing.

Figure 9.41 shows the timing for setting of the TCFU flag in TSR by underflow occurrence, and TCIU interrupt request signal timing.

Figure 9.40 TCIV Interrupt Setting Timing

Figure 9.41 TCIU Interrupt Setting Timing

## Status Flag Clearing Timing

After a status flag is read as 1 by the CPU, it is cleared by writing 0 to it. When the DTC is activated, the flag is cleared automatically. Figure 9.42 shows the timing for status flag clearing by the CPU, and figure 9.43 shows the timing for status flag clearing by the DTC.

Figure 9.42 Timing for Status Flag Clearing by CPU

Figure 9.43 Timing for Status Flag Clearing by DTC Activation

### 9.7 Usage Notes

Note that the kinds of operation and contention described below occur during TPU operation.

## Module Stop Mode Setting

TPU operation can be disabled or enabled using the module stop control register. The initial setting is for TPU operation to be halted. Register access is enabled by clearing module stop mode. For details, refer to section 18, Power-Down Modes.

## Input Clock Restrictions

The input clock pulse width must be at least 1.5 states in the case of single-edge detection, and at least 2.5 states in the case of both-edge detection. The TPU will not operate properly with a narrower pulse width.

In phase counting mode, the phase difference and overlap between the two input clocks must be at least 1.5 states, and the pulse width must be at least 2.5 states. Figure 9.44 shows the input clock conditions in phase counting mode.

Figure 9.44 Phase Difference, Overlap, and Pulse Width in Phase Counting Mode

## Caution on Period Setting

When counter clearing by compare match is set, TCNT is cleared in the final state in which it matches the TGR value (the point at which the count value matched by TCNT is updated). Consequently, the actual counter frequency is given by the following formula:

$$
f=\frac{\phi}{(N+1)}
$$

Where f: Counter frequency
$\phi$ : Operating frequency
N : TGR set value

## Contention between TCNT Write and Clear Operations

If the counter clear signal is generated in the T2 state of a TCNT write cycle, TCNT clearing takes precedence and the TCNT write is not performed.

Figure 9.45 shows the timing in this case.

Figure 9.45 Contention between TCNT Write and Clear Operations

## Contention between TCNT Write and Increment Operations

If incrementing occurs in the T 2 state of a TCNT write cycle, the TCNT write takes precedence and TCNT is not incremented.

Figure 9.46 shows the timing in this case.

Figure 9.46 Contention between TCNT Write and Increment Operations

## Contention between TGR Write and Compare Match

If a compare match occurs in the T2 state of a TGR write cycle, the TGR write takes precedence and the compare match signal is prohibited. A compare match does not occur even if the same value as before is written.

Figure 9.47 shows the timing in this case.

Figure 9.47 Contention between TGR Write and Compare Match

## Contention between Buffer Register Write and Compare Match

If a compare match occurs in the T 2 state of a TGR write cycle, the data transferred to TGR by the buffer operation will be the data prior to the write.

Figure 9.48 shows the timing in this case.

Figure 9.48 Contention between Buffer Register Write and Compare Match

## Contention between TGR Read and Input Capture

If the input capture signal is generated in the T1 state of a TGR read cycle, the data that is read will be the data after input capture transfer.

Figure 9.49 shows the timing in this case.

Figure 9.49 Contention between TGR Read and Input Capture

## Contention between TGR Write and Input Capture

If the input capture signal is generated in the T2 state of a TGR write cycle, the input capture operation takes precedence and the write to TGR is not performed.

Figure 9.50 shows the timing in this case.

Figure 9.50 Contention between TGR Write and Input Capture

## Contention between Buffer Register Write and Input Capture

If the input capture signal is generated in the T 2 state of a buffer write cycle, the buffer operation takes precedence and the write to the buffer register is not performed.

Figure 9.51 shows the timing in this case.

Figure 9.51 Contention between Buffer Register Write and Input Capture

## Contention between Overflow/Underflow and Counter Clearing

If overflow/underflow and counter clearing occur simultaneously, the TCFV/TCFU flag in TSR is not set and TCNT clearing takes precedence.

Figure 9.52 shows the operation timing when a TGR compare match is specified as the clearing source, and H'FFFF is set in TGR.

Figure 9.52 Contention between Overflow and Counter Clearing

## Contention between TCNT Write and Overflow/Underflow

If there is an up-count or down-count in the T2 state of a TCNT write cycle, and overflow/underflow occurs, the TCNT write takes precedence and the TCFV/TCFU flag in TSR is not set.

Figure 9.53 shows the operation timing in the case of contention between a TCNT write and overflow.

Figure 9.53 Contention between TCNT Write and Overflow

## Multiplexing of I/O Pins

In the H8S/2245 Group, the TCLKA input pin is multiplexed with the TIOCC0 I/O pin, the TCLKB input pin with the TIOCD0 I/O pin, the TCLKC input pin with the TIOCB1 I/O pin, and the TCLKD input pin with the TIOCB2 I/O pin. When an external clock is input, compare match output should not be performed from a multiplexed pin.

## Interrupts and Module Stop Mode

If module stop mode is entered when an interrupt has been requested, it will not be possible to clear the CPU interrupt source or DTC activation source. Interrupts should therefore be disabled before entering module stop mode.

## Section 10 8-Bit Timers

### 10.1 Overview

The H8S/2245 Group includes an 8-bit timer module with two channels (TMR0 and TMR1). Each channel has an 8 -bit counter (TCNT) and two time constant registers (TCORA and TCORB) that are constantly compared with the TCNT value to detect compare match events. The 8 -bit timer module can thus be used for a variety of functions, including pulse output with an arbitrary duty cycle.

### 10.1.1 Features

- Selection of four clock sources

The counters can be driven by one of three internal clock signals ( $\phi / 8, \phi / 64$, or $\phi / 8192$ ) or an external clock input (enabling use as an external event counter).

- Selection of three ways to clear the counters

The counters can be cleared on compare match A or B, or by an external reset signal.

- Timer output control by a combination of two compare match signals

The timer output signal in each channel is controlled by a combination of two independent compare match signals, enabling the timer to generate output waveforms with an arbitrary duty cycle or PWM output.

- Provision for cascading of two channels
- Operation as a 16 -bit timer is possible, using channel 0 for the upper 8 bits and channel 1 for the lower 8 bits ( 16 -bit count mode).
- Channel 1 can be used to count channel 0 compare matches (compare match count mode).
- Three independent interrupts

Compare match A and B and overflow interrupts can be requested independently.

- Module stop mode can be set
- As the initial setting, 8 -bit timer operation is halted. Register access is enabled by exiting module stop mode.

### 10.1.2 Block Diagram

Figure 10.1 shows a block diagram of the 8 -bit timer module.

Figure 10.1 Block Diagram of 8-Bit Timer

### 10.1.3 Pin Configuration

Table 10.1 summarizes the input and output pins of the 8 -bit timer.
Table 10.1 Input and Output Pins of 8-Bit Timer

| Channel | Name | Symbol | I/O | Function |
| :--- | :--- | :--- | :--- | :--- |
| 0 | Timer output pin 0 | TMO0 | Output | Outputs at compare match |
|  | Timer clock input pin 0 | TMCI0 | Input | Inputs external clock for counter |
|  | Timer reset input pin 0 | TMRI0 | Input | Inputs external reset to counter |
| 1 | Timer output pin 1 | TMO1 | Output | Outputs at compare match |
|  | Timer clock input pin 1 | TMCI1 | Input | Inputs external clock for counter |
|  | Timer reset input pin 1 | TMRI1 | Input | Inputs external reset to counter |

### 10.1.4 Register Configuration

Table 10.2 summarizes the registers of the 8 -bit timer module.
Table 10.2 8-Bit Timer Registers

| Channel | Name | Abbreviation | R/W | Initial Value | Address* ${ }^{1}$ |
| :---: | :---: | :---: | :---: | :---: | :---: |
| 0 | Timer control register 0 | TCR0 | R/W | H'00 | H'FFB0 |
|  | Timer control/status register 0 | TCSR0 | $\mathrm{R} /(\mathrm{W})$ * $^{2}$ | H'00 | H'FFB2 |
|  | Time constant register A0 | TCORA0 | R/W | H'FF | H'FFB4 |
|  | Time constant register B0 | TCORB0 | R/W | H'FF | H'FFB6 |
|  | Timer counter 0 | TCNT0 | R/W | $\mathrm{H}^{\prime} 00$ | H'FFB8 |
| 1 | Timer control register 1 | TCR1 | R/W | H'00 | H'FFB1 |
|  | Timer control/status register 1 | TCSR1 | R/(W)*2 | H'10 | H'FFB3 |
|  | Time constant register A1 | TCORA1 | R/W | H'FF | H'FFB5 |
|  | Time constant register B1 | TCORB1 | R/W | H'FF | H'FFB7 |
|  | Timer counter 1 | TCNT1 | R/W | $\mathrm{H}^{\prime} 00$ | H'FFB9 |
| All | Module stop control register | MSTPCR | R/W | H'3FFF | H'FF3C |

Notes: 1. Lower 16 bits of the address
2. Only 0 can be written to bits 7 to 5 , to clear these flags.

Each pair of registers for channel 0 and channel 1 is a 16-bit register with the upper 8 bits for channel 0 and the lower 8 bits for channel 1 , so they can be accessed together by word transfer instruction.

### 10.2 Register Descriptions

### 10.2.1 Timer Counters 0 and 1 (TCNT0, TCNT1)

|  | TCNTO |  |  |  |  |  |  |  | TCNT1 |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Bit : | $15$ | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
|  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

R/W : R/W R/W R/W R/W R/W R/W R/W R/W R/W R/W R/W R/W R/W R/W R/W R/W

TCNT0 and TCNT1 are 8-bit readable/writable up-counters that increment on pulses generated from an internal or external clock source. This clock source is selected by clock select bits CKS2 to CKS0 of TCR. The CPU can read or write to TCNT0 and TCNT1 at all times.

TCNT0 and TCNT1 comprise a single 16-bit register, so they can be accessed together by word transfer instruction.

TCNT0 and TCNT1 can be cleared by an external reset input or by a compare match signal.
Which signal is to be used for clearing is selected by clock clear bits CCLR1 and CCLR0 of TCR.
When a timer counter overflows from H'FF to $\mathrm{H}^{\prime} 00$, OVF in TCSR is set to 1 .

TCNT0 and TCNT1 are each initialized to H'00 by a reset and in hardware standby mode.

### 10.2.2 Time Constant Registers A0 and A1 (TCORA0, TCORA1)

R/W : R/W R/W R/W R/W R/W R/W R/W R/W R/W R/W R/W R/W R/W R/W R/W R/W

TCORA0 and TCORA1 are 8 -bit readable/writable registers. TCORA0 and TCORA1 comprise a single 16-bit register so they can be accessed together by word transfer instruction.

TCORA is continually compared with the value in TCNT. When a match is detected, the corresponding CMFA flag of TCSR is set. Note, however, that comparison is disabled during the T2 state of a TCORA write cycle.

The timer output can be freely controlled by these compare match signals and the settings of output select bits OS1 and OS0 of TCSR.

TCORA0 and TCORA1 are each initialized to H'FF by a reset and in hardware standby mode.

### 10.2.3 Time Constant Registers B0 and B1 (TCORB0, TCORB1)

R/W : R/W R/W R/W R/W R/W R/W R/W R/W R/W R/W R/W R/W R/W R/W R/W R/W

TCORB0 and TCORB1 are 8-bit readable/writable registers. TCORB0 and TCORB1 comprise a single 16-bit register so they can be accessed together by word transfer instruction.

TCORB is continually compared with the value in TCNT. When a match is detected, the corresponding CMFB flag of TCSR is set. Note, however, that comparison is disabled during the T2 state of a TCORB write cycle.

The timer output can be freely controlled by these compare match signals and the settings of output select bits OS3 and OS2 of TCSR.

TCORB0 and TCORB1 are each initialized to H'FF by a reset and in hardware standby mode.

### 10.2.4 Time Control Registers 0 and 1 (TCR0, TCR1)

| Bit | $:$ | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | CMIEB | CMIEA | OVIE | CCLR1 | CCLR0 | CKS2 | CKS1 | CKS0 |  |
|         <br> Initial value: 0 0 0 0 0 0 0 <br> R/W $:$ R/W R/W R/W R/W R/W R/W <br> R/W/W R/W       |  |  |  |  |  |  |  |  |  |

TCR0 and TCR1 are 8-bit readable/writable registers that select the clock source and the time at which TCNT is cleared, and enable interrupts.

TCR0 and TCR1 are each initialized to $\mathrm{H}^{\prime} 00$ by a reset and in hardware standby mode.
For details of this timing, see section 10.3, Operation.
Bit 7—Compare Match Interrupt Enable B (CMIEB): Selects whether CMFB interrupt requests (CMIB) are enabled or disabled when the CMFB flag of TCSR is set to 1 .

Bit 7

| CMIEB | Description |  |
| :--- | :--- | :--- |
| 0 | CMFB interrupt requests (CMIB) are disabled | (Initial value) |
| 1 | CMFB interrupt requests (CMIB) are enabled |  |

Bit 6—Compare Match Interrupt Enable A (CMIEA): Selects whether CMFA interrupt requests (CMIA) are enabled or disabled when the CMFA flag of TCSR is set to 1 .

## Bit 6

CMIEA Description

| 0 | CMFA interrupt requests (CMIA) are disabled | (Initial value) |
| :--- | :--- | :---: |
| 1 | CMFA interrupt requests (CMIA) are enabled |  |

Bit 5—Timer Overflow Interrupt Enable (OVIE): Selects whether OVF interrupt requests (OVI) are enabled or disabled when the OVF flag of TCSR is set to 1 .

Bit 5

| OVIE | Description |  |
| :--- | :--- | :--- |
| 0 | OVF interrupt requests $(\mathrm{OVI})$ are disabled | (Initial value) |
| 1 | OVF interrupt requests $(\mathrm{OVI})$ are enabled |  |

Bits 4 and 3-Counter Clear 1 and 0 (CCLR1 and CCLR0): These bits select the method by which TCNT is cleared: by compare match A or B, or by an external reset input.

| Bit $\mathbf{4}$ | Bit $\mathbf{3}$ |  |  |
| :--- | :--- | :--- | :--- |
| CCLR1 | CCLR $\mathbf{0}$ | Description | (Initial value) |
| 0 | 0 | Clear is disabled |  |
| 1 | Clear by compare match A |  |  |
| 1 | 0 | Clear by compare match B |  |
| 1 | Clear by rising edge of external reset input |  |  |

Bits 2 to 0—Clock Select $\mathbf{2}$ to 0 (CKS2 to CKS0): These bits select whether the clock input to TCNT is an internal or external clock.

Three internal clocks can be selected, all divided from the system clock ( $\phi$ ): $\phi / 8, \phi / 64$, and $\phi / 8192$. The falling edge of the selected internal clock triggers the count.

When use of an external clock is selected, three types of count can be selected: at the rising edge, the falling edge, and both rising and falling edges.

Some functions differ between channel 0 and channel 1.

| Bit 2 | Bit 1 | Bit 0 |  |
| :---: | :---: | :---: | :---: |
| CKS2 | CKS1 | CKSO | Description |
| 0 | 0 | 0 | Clock input disabled (Initial value) |
|  |  | 1 | Internal clock, counted at falling edge of $\phi / 8$ |
|  | 1 | 0 | Internal clock, counted at falling edge of $\phi / 64$ |
|  |  | 1 | Internal clock, counted at falling edge of $\phi / 8192$ |
| 1 | 0 | 0 | For channel 0: count at TCNT1 overflow signal* |
|  |  |  | For channel 1: count at TCNT0 compare match A* |
|  |  | 1 | External clock, counted at rising edge |
|  | 1 | 0 | External clock, counted at falling edge |
|  |  | 1 | External clock, counted at both rising and falling edges |

Note: * If the count input of channel 0 is the TCNT1 overflow signal and that of channel 1 is the TCNTO compare match signal, no incrementing clock is generated. Do not use this setting.

### 10.2.5 Timer Control/Status Registers 0 and 1 (TCSR0, TCSR1)

TCSRO

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | CMFB | CMFA | OVF | ADTE | OS3 | OS2 | OS1 | OSO |
| Initial value : | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | $\mathrm{R} / \mathrm{W})^{*}$ | R/(W)* | R/(W)* | R/W | R/W | R/W | R/W | R/W |

## TCSR1

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | CMFB | CMFA | OVF | - | OS3 | OS2 | OS1 | OSO |
| Initial value | 0 | 0 | 0 | 1 | 0 | 0 | 0 | 0 |
| R/W | R/(W)* | R/(W)* | R/(W)* | - | R/W | R/W | R/W | R/W |

Note: * Only 0 can be written to bits 7 to 5 , to clear these flags.

TCSR0 and TCSR1 are 8-bit registers that display compare match and overflow statuses, and control compare match output.

TCSR0 is initialized to $\mathrm{H}^{\prime} 00$, and TCSR1 to $\mathrm{H}^{\prime} 10$, by a reset and in hardware standby mode.
Bit 7—Compare Match Flag B (CMFB): Status flag indicating whether the values of TCNT and TCORB match.

## Bit 7

CMFB Description
0 [Clearing conditions] (Initial value)

- Cleared by reading CMFB when CMFB $=1$, then writing 0 to CMFB
- When DTC is activated by CMIB interrupt while DISEL bit of MRB in DTC is 0 with the transfer counter not being 0

1 [Setting condition] | Set when TCNT matches TCORB |
| :--- |

Bit 6-Compare Match Flag A (CMFA): Status flag indicating whether the values of TCNT and TCORA match.

## Bit 6

| CMFA | Description | (Initial value) |
| :--- | :--- | :--- |
| 0 | [Clearing conditions] |  |
|  | - Cleared by reading CMFA when CMFA $=1$, then writing 0 to CMFA |  |
|  | - When DTC is activated by CMIA interrupt while DISEL bit of MRB in DTC is 0 with |  |
|  | the transfer counter not being 0 |  |
| 1 | [Setting condition] |  |
|  | Set when TCNT matches TCORA |  |

Bit 5-Timer Overflow Flag (OVF): Status flag indicating that TCNT has overflowed (changed from $\mathrm{H}^{\prime} \mathrm{FF}$ to $\mathrm{H}^{\prime} 00$ ).

| Bit $\mathbf{5}$  <br> OVF Description |  |  |
| :--- | :--- | :--- |
| 0 | [Clearing condition] | (Initial value) |
|  | Cleared by reading OVF when OVF $=1$, then writing 0 to OVF |  |
| 1 | [Setting condition] |  |
|  | Set when TCNT overflows from H'FF to H'00 |  |

Bit 4—A/D Trigger Enable (ADTE) (TCSR0 Only): Selects enabling or disabling of A/D converter start requests by compare-match A.

In TCSR1, this bit is reserved: it is always read as 1 and cannot be modified.
Bit 4

| ADTE | Description |  |
| :--- | :--- | :--- | :--- |
| 0 | A/D converter start requests by compare match A are disabled | (Initial value) |
| 1 | A/D converter start requests by compare match A are enabled |  |

Bits 3 to 0-Output Select 3 to 0 (OS3 to OSO): These bits specify how the timer output level is to be changed by a compare match of TCOR and TCNT.

Bits OS3 and OS2 select the effect of compare match B on the output level, bits OS1 and OS0 select the effect of compare match A on the output level, and both of them can be controlled independently.

Note, however, that priorities are set such that: toggle output $>1$ output $>0$ output. If compare matches occur simultaneously, the output changes according to the compare match with the higher priority.

Timer output is disabled when bits OS3 to OS0 are all 0.
After a reset, the timer output is 0 until the first compare match event occurs.

| Bit 3 | Bit 2 |  |  |
| :--- | :--- | :--- | :--- |
| OS3 | OS2 | Description | (Initial value) |
| 0 | 0 | No change when compare match B occurs |  |
| 1 | 0 | is output when compare match B occurs | 1 is output when compare match B occurs |
| 1 | 0 | Output is inverted when compare match B occurs (toggle output) |  |

| Bit 1 | Bit $\mathbf{0}$ |  |  |
| :--- | :--- | :--- | :--- |
| OS1 | OS0 | Description | (Initial value) |
| 0 | 0 | No change when compare match A occurs |  |
|  | 1 | 0 is output when compare match A occurs |  |
| 1 | 0 | 1 is output when compare match A occurs |  |
| 1 | Output is inverted when compare match A occurs (toggle output) |  |  |

### 10.2.6 Module Stop Control Register (MSTPCR)

R/W : R/W R/W R/W R/W R/W R/W R/W R/W R/W R/W R/W R/W R/W R/W R/W R/W

MSTPCR is a 16-bit readable/writable register that performs module stop mode control.
When the MSTP12 bit in MSTPCR is set to 1 , the 8 -bit timer operation stops at the end of the bus cycle and a transition is made to module stop mode. Registers cannot be read or written to in module stop mode. For details, see section 18.5, Module Stop Mode.

MSTPCR is initialized to H'3FFF by a reset and in hardware standby mode. It is not initialized in software standby mode.

Bit 12—Module Stop (MSTP12): Specifies the 8-bit timer stop mode.

## Bit 12

MSTP12 Description

| 0 | 8-bit timer module stop mode cleared |  |
| :--- | :--- | :--- |
| 1 | 8-bit timer module stop mode set | (Initial value) |

### 10.3 Operation

### 10.3.1 TCNT Incrementation Timing

TCNT is incremented by input clock pulses (either internal or external).

## Internal Clock

Three different internal clock signals ( $\phi / 8, \phi / 64$, or $\phi / 8192$ ) divided from the system clock ( $\phi$ ) can be selected, by setting bits CKS2 to CKS0 in TCR. Figure 10.2 shows the count timing.

Figure 10.2 Count Timing for Internal Clock Input

## External Clock

Three incrementation methods can be selected by setting bits CKS2 to CKS0 in TCR: at the rising edge, the falling edge, and both rising and falling edges.

Note that the external clock pulse width must be at least 1.5 states for incrementation at a single edge, and at least 2.5 states for incrementation at both edges. The counter will not increment correctly if the pulse width is less than these values.

Figure 10.3 shows the timing of incrementation at both edges of an external clock signal.

Figure 10.3 Count Timing for External Clock Input

### 10.3.2 Compare Match Timing

## Setting of Compare Match Flags A and B (CMFA, CMFB)

The CMFA and CMFB flags in TCSR are set to 1 by a compare match signal generated when the TCOR and TCNT values match. The compare match signal is generated at the last state in which the match is true, just before the timer counter is updated.

Therefore, when TCOR and TCNT match, the compare match signal is not generated until the next incrementation clock input. Figure 10.4 shows this timing.
TCNT

| TCOR |
| :--- |
| Compare match <br> signal |
| CMF |$+$ N

Figure 10.4 Timing of CMF Setting

## Timer output timing

When compare match A or B occurs, the timer output changes a specified by bits OS3 to OS0 in TCSR. Depending on these bits, the output can remain the same, change to 0 , change to 1 , or toggle.

Figure 10.5 shows the timing when the output is set to toggle at compare match A.

Figure 10.5 Timing of Timer Output

## Timing of Compare Match Clear

The timer counter is cleared when compare match A or B occurs, depending on the setting of the CCLR1 and CCLR0 bits in TCR. Figure 10.6 shows the timing of this operation.

Figure 10.6 Timing of Compare Match Clear

### 10.3.3 Timing of External RESET on TCNT

TCNT is cleared at the rising edge of an external reset input, depending on the settings of the CCLR1 and CCLR0 bits in TCR. The clear pulse width must be at least 1.5 states. Figure 10.7 shows the timing of this operation.

Figure 10.7 Timing of External Reset

### 10.3.4 Timing of Overflow Flag (OVF) Setting

The OVF in TCSR is set to 1 when the timer count overflows (changes from $\mathrm{H}^{\prime} \mathrm{FF}$ to $\mathrm{H}^{\prime} 00$ ). Figure 10.8 shows the timing of this operation.

Figure 10.8 Timing of OVF Setting

### 10.3.5 Operation with Cascaded Connection

If bits CKS2 to CKS0 in either TCR0 or TCR1 are set to B'100, the 8 -bit timers of the two channels are cascaded. With this configuration, a single 16 -bit timer could be used (16-bit timer mode) or compare matches of the 8 -bit channel 0 could be counted by the timer of channel 1 (compare match counter mode). In this case, the timer operates as below.

## 16-Bit Counter Mode

When bits CKS2 to CKS0 in TCR0 are set to B'100, the timer functions as a single 16-bit timer with channel 0 occupying the upper 8 bits and channel 1 occupying the lower 8 bits.

- Setting of compare match flags
- The CMF flag in TCSR0 is set to 1 when a 16 -bit compare match event occurs.
- The CMF flag in TCSR1 is set to 1 when a lower 8-bit compare match event occurs.
- Counter clear specification
- If the CCLR1 and CCLR0 bits in TCR0 have been set for counter clear at compare match, the 16 -bit counter (TCNT0 and TCNT1 together) is cleared when a 16 -bit compare match event occurs. The 16 -bit counter (TCNT0 and TCNT1 together) is cleared even if counter clear by the TMRI0 pin has also been set.
- The settings of the CCLR1 and CCLR0 bits in TCR1 are ignored. The lower 8 bits cannot be cleared independently.
- Pin output
- Control of output from the TMO0 pin by bits OS3 to OS0 in TCSR0 is in accordance with the 16 -bit compare match conditions.
- Control of output from the TMO1 pin by bits OS3 to OS0 in TCSR1 is in accordance with the lower 8-bit compare match conditions.

## Compare Match Counter Mode

When bits CKS2 to CKS0 in TCR1 are B'100, TCNT1 counts compare match A's for channel 0 .
Channels 1 and 0 are controlled independently. Conditions such as setting of the CMF flag, generation of interrupts, output from the TMO pin, and counter clear are in accordance with the settings for each channel.

## Note on Usage

If the 16 -bit counter mode and compare match counter mode are set simultaneously, the input clock pulses for TCNT0 and TCNT1 are not generated and thus the counters will stop operating. Software should therefore avoid using both these modes.

### 10.4 Interrupt Sources

### 10.4.1 Interrupt Sources and DTC Activation

There are three 8-bit timer interrupt sources: CMIA, CMIB, and OVI. Their relative priorities are shown in table 10.3 . Each interrupt source is set as enabled or disabled by the corresponding interrupt enable bit in TCR, and independent interrupt requests are sent for each to the interrupt controller. It is also possible to activate the DTC by means of CMIA and CMIB interrupts.

Table 10.3 8-Bit Timer Interrupt Sources

| Channel | Interrupt Source | Description | DTC Activation | Priority |
| :--- | :--- | :--- | :--- | :--- |
| 0 | CMIA0 | Interrupt by CMFA | Possible | High |
|  | CMIB0 | Interrupt by CMFB | Possible |  |
| OVI0 | Interrupt by OVF | Not possible |  |  |
| 1 | CMIA1 | Interrupt by CMFA | Possible |  |
| CMIB1 | Interrupt by CMFB | Possible |  |  |
| OVI1 | Interrupt by OVF | Not possible | Low |  |

Note: This table shows the initial state immediately after a reset. The relative channel priorities can be changed by the interrupt controller.

### 10.4.2 A/D Converter Activation

The A/D converter can be activated only by channel 0 compare match A.
If the ADTE bit in TCSR0 is set to 1 when the CMFA flag is set to 1 by the occurrence of channel 0 compare match A , a request to start $\mathrm{A} / \mathrm{D}$ conversion is sent to the $\mathrm{A} / \mathrm{D}$ converter. If the 8 -bit timer conversion start trigger has been selected on the A/D converter side at this time, A/D conversion is started.

### 10.5 Sample Application

In the example below, the 8 -bit timer is used to generate a pulse output with a selected duty cycle, as shown in figure 10.9. The control bits are set as follows:
[1] In TCR, bit CCLR1 is cleared to 0 and bit CCLR0 is set to 1 so that the timer counter is cleared when its value matches the constant in TCORA.
[2] In TCSR, bits OS3 to OS0 are set to B' 0110 , causing the output to change to 1 at a TCORA compare match and to 0 at a TCORB compare match.

With these settings, the 8 -bit timer provides output of pulses at a rate determined by TCORA with a pulse width determined by TCORB. No software intervention is required.

Figure 10.9 Example of Pulse Output

### 10.6 Usage Notes

Application programmers should note that the following kinds of contention can occur in the 8-bit timer.

### 10.6.1 Setting Module Stop Mode

The TMR is enabled or disabled by setting the module stop control register. In the initial state, the TMR is disabled. After the module stop mode is canceled, registers can be accessed. For details, see section 18, Power-Down Modes.

### 10.6.2 Contention between TCNT Write and Clear

If a timer counter clock pulse is generated during the T2 state of a TCNT write cycle, the clear takes priority, so that the counter is cleared and the write is not performed.

Figure 10.10 shows this operation.

Figure 10.10 Contention between TCNT Write and Clear

### 10.6.3 Contention between TCNT Write and Increment

If a timer counter clock pulse is generated during the T2 state of a TCNT write cycle, the write takes priority and the counter is not incremented.

Figure 10.11 shows this operation.

Figure 10.11 Contention between TCNT Write and Increment

### 10.6.4 Contention between TCOR Write and Compare Match

During the T2 state of a TCOR write cycle, the TCOR write has priority even if a compare match event occurs.

Figure 10.12 shows this operation.

Figure 10.12 Contention between TCOR Write and Compare Match

### 10.6.5 Contention between Compare Matches A and B

If compare match events A and B occur at the same time, the 8 -bit timer operates in accordance with the priorities for the output statuses set for compare match A and compare match B, as shown in table 10.4.

Table 10.4 Timer Output Priorities

| Output Setting | Priority |
| :--- | :--- |
| Toggle output | High |
| 1 output |  |
| 0 output | Low |
| No change |  |

### 10.6.6 Switching of Internal Clocks and TCNT Operation

TCNT may increment erroneously when the internal clock is switched over. Table 10.5 shows the relationship between the timing at which the internal clock is switched (by writing to the CKS1 and CKSO bits) and the TCNT operation.

When the TCNT clock is generated from an internal clock, the falling edge of the internal clock pulse is detected. If clock switching causes a change from high to low level, as shown in case 3 in table 10.5 , a TCNT clock pulse is generated on the assumption that the switchover is a falling edge. This increments TCNT.

The erroneous incrementation can also happen when switching between internal and external clocks.

Table 10.5 Switching of Internal Clock and TCNT Operation
Timing of Switchover by Means of CKS1
No. and CKSO Bits
1
Switching from low to low*'

2 Switching from low to high**

3 Switching from high to low ${ }^{* 3}$

Notes: 1. Includes switching from low to stop, and from stop to low.
2. Includes switching from stop to high.
3. Includes switching from high to stop.
4. Generated on the assumption that the switchover is a falling edge; TCNT is incremented.

### 10.6.7 Interrupts and Module Stop Mode

If module stop mode is entered when an interrupt has been requested, it will not be possible to clear the CPU interrupt source or DTC activation source. Interrupts should therefore be disabled before entering module stop mode.

## Section 11 Watchdog Timer

### 11.1 Overview

The H8S/2245 Group has a single-channel on-chip watchdog timer (WDT) for monitoring system operation. The WDT outputs an overflow signal (WDTOVF) if a system crash prevents the CPU from writing to the timer counter, allowing it to overflow. At the same time, the WDT can also generate an internal reset signal for the H8S/2245 Group.

When this watchdog function is not needed, the WDT can be used as an interval timer. In interval timer operation, an interval timer interrupt is generated each time the counter overflows.

### 11.1.1 Features

WDT features are listed below.

- Switchable between watchdog timer mode and interval timer mode
- $\overline{\mathrm{WDTOVF}}$ output when in watchdog timer mode If the counter overflows, the WDT outputs $\overline{\mathrm{WDTOVF}}$. It is possible to select whether or not the entire H8S/2245 Group is reset at the same time. This internal reset can be a power-on reset or a manual reset.
- Interrupt generation when in interval timer mode

If the counter overflows, the WDT generates an interval timer interrupt.

- Choice of eight counter clock sources.

### 11.1.2 Block Diagram

Figure 11.1 shows a block diagram of the WDT.

Figure 11.1 Block Diagram of WDT

### 11.1.3 Pin Configuration

Table 11.1 describes the WDT output pin.
Table 11.1 WDT Pin

| Name | Symbol | I/O | Function |
| :--- | :--- | :--- | :--- |
| Watchdog timer overflow | $\overline{\text { WDTOVF }}$ | Output | Outputs counter overflow signal in watchdog <br> timer mode |

### 11.1.4 Register Configuration

The WDT has three registers, as summarized in table 11.2. These registers control clock selection, WDT mode switching, and the reset signal.

Table 11.2 WDT Registers

| Name | Abbreviation | R/W | Initial Value | Address* ${ }^{1}$ |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
|  |  |  |  | Write* ${ }^{\text {2 }}$ | Read |
| Timer control/status register | TCSR | R/(W)* ${ }^{3}$ | H'18 | H'FFBC | H'FFBC |
| Timer counter | TCNT | R/W | H'00 | H'FFBC | H'FFBD |
| Reset control/status register | RSTCSR | R/(W)*3 | H'1F | H'FFBE | H'FFBF |

Notes: 1. Lower 16 bits of the address.
2. For details of write operations, see section 11.2.4, Notes on Register Access.
3. Only a write of 0 is permitted to bit 7 , to clear the flag.

### 11.2 Register Descriptions

### 11.2.1 Timer Counter (TCNT)

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Initial value : | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

TCNT is an 8-bit readable/writable* up-counter.

When the TME bit is set to 1 in TCSR, TCNT starts counting pulses generated from the internal clock source selected by bits CKS2 to CKS0 in TCSR. When the count overflows (changes from H'FF to H'00), either the watchdog timer overflow signal ( $\overline{\mathrm{WDTOVF}}$ ) or an interval timer interrupt (WOVI) is generated, depending on the mode selected by the WT/IT bit in TCSR.

TCNT is initialized to H'00 by a reset, in hardware standby mode, or when the TME bit is cleared to 0 . It is not initialized in software standby mode.

Note: * TCNT is write-protected by a password to prevent accidental overwriting. For details see section 11.2.4, Notes on Register Access.

### 11.2.2 Timer Control/Status Register (TCSR)

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | OVF | WT/IT | TME | - | - | CKS2 | CKS1 | CKS0 |
| Initial value: | 0 | 0 | 0 | 1 | 1 | 0 | 0 | 0 |
| R/W | $\mathrm{R} /(\mathrm{W})^{*}$ | R/W | R/W | - | - | R/W | R/W | R/W |

Note: * Can only be written with 0 for flag clearing.

TCSR is an 8-bit readable/writable* register. Its functions include selecting the clock source to be input to TCNT, and the timer mode.

TCR is initialized to H'18 by a reset and in hardware standby mode. It is not initialized in software standby mode.

Note: * TCSR is write-protected by a password to prevent accidental overwriting. For details see section 11.2.4, Notes on Register Access.

Bit 7—Overflow Flag (OVF): Indicates that TCNT has overflowed from $\mathrm{H}^{\prime} \mathrm{FF}$ to $\mathrm{H}^{\prime} 00$, when in interval timer mode. This flag cannot be set during watchdog timer operation.

Bit 7
OVF Description

| 0 | [Clearing condition] |  |
| :--- | :--- | :--- |
|  | Cleared by reading TCSR when OVF $=1$, then writing 0 to OVF* | (Initial value) |

1 [Setting condition]

Set when TCNT overflows (changes from H'FF to $\mathrm{H}^{\prime} \mathrm{OO}$ ) in interval timer mode
Note: * When OVF is polled and the interval timer interrupt is disabled, OVF = 1 must be read at least twice.

Bit 6-Timer Mode Select (WT/IT): Selects whether the WDT is used as a watchdog timer or interval timer. If used as an interval timer, the WDT generates an interval timer interrupt request (WOVI) when TCNT overflows. If used as a watchdog timer, the WDT generates the WDTOVF signal when TCNT overflows.

## Bit 6

| WT/IT | Description |
| :---: | :---: |
| 0 | Interval timer: Sends the CPU an interval timer interrupt request (WOVI) when TCNT overflows <br> (Initial value) |
| 1 | Watchdog timer: Generates the WDTOVF signal when TCNT overflows* |
| Note: | For details of the case where TCNT overflows in watchdog timer mode, see section 11.2.3, Reset Control/Status Register (RSTCSR). |

Bit 5—Timer Enable (TME): Selects whether TCNT runs or is halted.

| Bit 5 |  |  |
| :--- | :--- | :--- |
| TME | Description | (Initial value) |
| 0 | TCNT is initialized to H'00 and halted |  |
| 1 | TCNT counts |  |

Bits 4 and 3-Reserved: Read-only bits, always read as 1.

Bits 2 to 0: Clock Select 2 to 0 (CKS2 to CKSO): These bits select one of eight internal clock sources, obtained by dividing the system clock $(\phi)$, for input to TCNT.

| Bit 2 | Bit 1 | Bit 0 | Description |  |
| :---: | :---: | :---: | :---: | :---: |
| CKS2 | CKS1 | CKS0 | Clock | Overflow period (when $\phi=\mathbf{2 0} \mathbf{~ M H z}$ ) ${ }^{\text {* }}$ |
| 0 | 0 | 0 | $\phi / 2$ (initial value) | 25.6 ¢ |
|  |  | 1 | ¢/64 | 819.2 ¢ |
|  | 1 | 0 | ¢/128 | 1.6 ms |
|  |  | 1 | ¢/512 | 6.6 ms |
| 1 | 0 | 0 | ¢/2048 | 26.2 ms |
|  |  | 1 | ¢/8192 | 104.9 ms |
|  | 1 | 0 | \$/32768 | 419.4 ms |
|  |  | 1 | $\phi / 131072$ | 1.68 s |

Note: * The overflow period is the time from when TCNT starts counting up from H'00 until overflow occurs.

### 11.2.3 Reset Control/Status Register (RSTCSR)

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | WOVF | RSTE | RSTS | - | - | - | - | - |
| Initial value: | 0 | 0 | 0 | 1 | 1 | 1 | 1 | 1 |
| R/W | $\mathrm{R} /(\mathrm{W})^{*}$ | R/W | R/W | - | - | - | - | - |

Note: * Can only be written with 0 for flag clearing.

RSTCSR is an 8-bit readable/writable* register that controls the generation of the internal reset signal when TCNT overflows, and selects the type of internal reset signal.

RSTCSR is initialized to H'1F by a reset signal from the $\overline{\mathrm{RES}}$ pin, but not by the WDT internal reset signal caused by overflows.

Note: * RSTCSR is write-protected by a password to prevent accidental overwriting. For details see section 11.2.4, Notes on Register Access.

Bit 7—Watchdog Timer Overflow Flag (WOVF): Indicates that TCNT has overflowed (changed from H'FF to $\mathrm{H}^{\prime} 00$ ) during watchdog timer operation. This bit is not set in interval timer mode.

## Bit 7

| WOVF | Description |
| :--- | :--- |
| 0 | [Clearing condition] |
| Cleared by reading RSTCSR when WOVF = 1, then writing 0 to WOVF |  |
| 1 | [Setting condition] <br> Set when TCNT overflows (changes from H'FF to H'00) during watchdog timer <br> operation |

Bit 6-Reset Enable (RSTE): Specifies whether or not a reset signal is generated in the H8S/2245 Group if TCNT overflows during watchdog timer operation.

## Bit 6

RSTE Description

| 0 | Reset signal is not generated if TCNT overflows* | (Initial value) |
| :--- | :--- | :--- |
| 1 |  | Reset signal is generated if TCNT overflows |
| Note: | $*$ | The modules within the H8S/2245 Group are not reset, but TCNT and TCSR within the |
|  | WDT are reset. |  |

Bit 5—Reset Select (RSTS): Selects the type of internal reset generated if TCNT overflows during watchdog timer operation.

For details of the types of resets, see section 4, Exception Handling.
Bit 5
RSTS Description

| 0 | Power-on reset | (Initial value) |
| :--- | :--- | :---: |
| 1 | Manual reset |  |

Bits 4 to 0—Reserved: Read-only bits, always read as 1.

### 11.2.4 Notes on Register Access

The watchdog timer's TCNT, TCSR, and RSTCSR registers differ from other registers in being more difficult to write to. The procedures for writing to and reading these registers are given below.

## Writing to TCNT and TCSR

These registers must be written to by a word transfer instruction. They cannot be written to with byte instructions.

Figure 11.2 shows the format of data written to TCNT and TCSR. TCNT and TCSR both have the same write address. For a write to TCNT, the upper byte of the written word must contain H'5A and the lower byte must contain the write data. For a write to TCSR, the upper byte of the written word must contain H'A5 and the lower byte must contain the write data. This transfers the write data from the lower byte to TCNT or TCSR (see figure 11.2).

| TCNT write |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
|  | 15 | 87 |  |  | 0 |
| Address: H'FFBC |  | H'5A |  | Write data |  |
| TCSR write |  |  |  |  |  |
|  | 15 |  | 8 |  | 0 |
| Address: H'FFBC |  | H'A5 |  | Write data |  |

Figure 11.2 Format of Data Written to TCNT and TCSR

## Writing to RSTCSR

RSTCSR must be written to by word transfer instruction to address H'FFBE. It cannot be written to with byte instructions.

Figure 11.3 shows the format of data written to RSTCSR. The method of writing 0 to the WOVF bit differs from that for writing to the RSTE and RSTS bits.

To write 0 to the WOVF flag, the write data must have H'A5 in the upper byte and $\mathrm{H}^{\prime} 00$ in the lower byte. This clears the WOVF bit to 0, but has no effect on the RSTE and RSTS bits. To write to the RSTE and RSTS bits, the upper byte must contain H'5A and the lower byte must contain the write data. This writes the values in bits 6 and 5 of the lower byte into the RSTE and RSTS bits, but has no effect on the WOVF flag.

Figure 11.3 Format of Data Written to RSTCSR

## Reading TCNT, TCSR, and RSTCSR

These registers are read in the same way as other registers. The read addresses are H'FFBC for TCSR, H'FFBD for TCNT, and H'FFBF for RSTCSR.

### 11.3 Operation

### 11.3.1 Watchdog Timer Operation

To use the WDT as a watchdog timer, set the WT/ITT and TME bits to 1 . Software must prevent TCNT overflows by rewriting the TCNT value (normally be writing H'00) before overflows occurs. This ensures that TCNT does not overflow while the system is operating normally. If TCNT overflows without being rewritten because of a system crash or other error, the $\overline{\text { WDTOVF }}$ signal is output. This is shown in figure 11.4. This WDTOVF signal can be used to reset the system. The $\overline{\mathrm{WDTOVF}}$ signal is output for 132 states when $\operatorname{RSTE}=1$, and for 130 states when RSTE $=0$.

If TCNT overflows when 1 is set in the RSTE bit in RSTCSR, a signal that resets the H8S/2245 Group internally is generated at the same time as the $\overline{\text { WDTOVF }}$ signal. This reset can be selected as a power-on reset or a manual reset, depending on the setting of the RSTS bit in RSTCSR. The internal reset signal is output for 518 states.

If a reset caused by a signal input to the $\overline{\mathrm{RES}}$ pin occurs at the same time as a reset caused by a WDT overflow, the $\overline{\operatorname{RES}}$ pin reset has priority and the WOVF flag in RSTCSR is cleared to 0 .

Figure 11.4 Watchdog Timer Operation

### 11.3.2 Interval Timer Operation

To use the WDT as an interval timer, clear the WT/IT bit in TCSR to 0 and set the TME bit to 1 . An interval timer interrupt (WOVI) is generated each time TCNT overflows, provided that the WDT is operating as an interval timer, as shown in figure 11.5. This function can be used to generate interrupt requests at regular intervals.

Figure 11.5 Interval Timer Operation

### 11.3.3 Timing of Setting Overflow Flag (OVF)

The OVF flag is set to 1 if TCNT overflows during interval timer operation. At the same time, an interval timer interrupt (WOVI) is requested. This timing is shown in figure 11.6.

Figure 11.6 Timing of Setting of OVF

### 11.3.4 Timing of Setting of Watchdog Timer Overflow Flag (WOVF)

The WOVF flag is set to 1 if TCNT overflows during watchdog timer operation. At the same time, the $\overline{\text { WDTOVF }}$ signal goes low. If TCNT overflows while the RSTE bit in RSTCSR is set to 1 , an internal reset signal is generated for the entire H8S/2245 Group chip. Figure 11.7 shows the timing in this case.

Figure 11.7 Timing of Setting of WOVF

### 11.4 Interrupts

During interval timer mode operation, an overflow generates an interval timer interrupt (WOVI). The interval timer interrupt is requested whenever the OVF flag is set to 1 in TCSR. OVF must be cleared to 0 in the interrupt handling routine.

### 11.5 Usage Notes

### 11.5.1 Contention between Timer Counter (TCNT) Write and Increment

If a timer counter clock pulse is generated during the T2 state of a TCNT write cycle, the write takes priority and the timer counter is not incremented. Figure 11.8 shows this operation.

Figure 11.8 Contention between TCNT Write and Increment

### 11.5.2 Changing Value of CKS2 to CKS0

If bits CKS2 to CKS0 in TCSR are written to while the WDT is operating, errors could occur in the incrementation. Software must stop the watchdog timer (by clearing the TME bit to 0 ) before changing the value of bits CKS2 to CKS0.

### 11.5.3 Switching between Watchdog Timer Mode and Interval Timer Mode

If the mode is switched from watchdog timer to interval timer, or vice versa, while the WDT is operating, errors could occur in the incrementation. Software must stop the watchdog timer (by clearing the TME bit to 0 ) before switching the mode.

### 11.5.4 System Reset by $\overline{\text { WDTOVF }}$ Signal

If the $\overline{\text { WDTOVF }}$ output signal is input to the $\overline{\mathrm{RES}}$ pin of the H8S/2245 Group, the H8S/2245 Group will not be initialized correctly. Make sure that the $\overline{\text { WDTOVF signal is not input logically }}$ to the $\overline{\mathrm{RES}}$ pin. To reset the entire system by means of the $\overline{\mathrm{WDTOVF}}$ signal, use the circuit shown in figure 11.9 .

Figure 11.9 Circuit for System Reset by $\overline{\text { WDTOVF }}$ Signal (Example)

### 11.5.5 Internal Reset in Watchdog Timer Mode

The H8S/2245 Group is not reset internally if TCNT overflows while the RSTE bit is cleared to 0 during watchdog timer operation, but TCNT and TSCR of the WDT are reset.

TCNT, TCSR, and RSTCR cannot be written to while the $\overline{\text { WDTOVF }}$ signal is low. Also note that a read of the WOVF flag is not recognized during this period. To clear the WOVF flag, therefore, read TCSR after the $\overline{\mathrm{WDTOVF}}$ signal goes high, then write 0 to the WOVF flag.

### 11.5.6 OVF Flag Clearing in Interval Timer Mode

When the OVF flag setting conflicts with the OVF flag reading in interval timer mode, writing 0 to the OVF bit may not clear the flag even though the OVF bit has been read while it is 1 . If there is a possibility that the OVF flag setting and reading will conflict, such as when the OVF flag is polled with the interval timer interrupt disabled, read the OVF bit while it is 1 at least twice before writing 0 to the OVF bit to clear the flag.

## Section 12 Serial Communication Interface (SCI)

### 12.1 Overview

The H8S/2245 Group is equipped with a 3-channel serial communication interface (SCI). All three channels have the same functions. The SCI can handle both asynchronous and clocked synchronous serial communication. A function is also provided for serial communication between processors (multiprocessor communication function).

### 12.1.1 Features

SCI features are listed below.

- Choice of asynchronous or clocked synchronous serial communication mode

Asynchronous mode

- Serial data communication executed using asynchronous system in which synchronization is achieved character by character
Serial data communication can be carried out with standard asynchronous communication chips such as a Universal Asynchronous Receiver/Transmitter (UART) or Asynchronous Communication Interface Adapter (ACIA)
- A multiprocessor communication function is provided that enables serial data communication with a number of processors
- Choice of 12 serial data transfer formats

Data length: $\quad 7$ or 8 bits
Stop bit length: $\quad 1$ or 2 bits
Parity: Even, odd, or none
Multiprocessor bit: $\quad 1$ or 0

- Receive error detection: Parity, overrun, and framing errors
- Break detection: $\quad$ Break can be detected by reading the RxD pin level directly in case of a framing error

## Clocked Synchronous mode

- Serial data communication synchronized with a clock

Serial data communication can be carried out with other chips that have a synchronous communication function

- One serial data transfer format

Data length: 8 bits

- Receive error detection: Overrun errors detected
- Full-duplex communication capability
- The transmitter and receiver are mutually independent, enabling transmission and reception to be executed simultaneously
- Double-buffering is used in both the transmitter and the receiver, enabling continuous transmission and continuous reception of serial data
- On-chip baud rate generator allows any bit rate to be selected
- Choice of LSB-first or MSB-first transfer (8 bits length)
- Can be selected regardless of the communication mode*

Note: * Descriptions in this section refer to LSB-first transfer.

- Choice of serial clock source: internal clock from baud rate generator or external clock from SCK pin
- Four interrupt sources
- Four interrupt sources - transmit-data-empty, transmit-end, receive-data-full, and receive error - that can issue requests independently
- The transmit-data-empty interrupt and receive data full interrupts can activate data transfer controller (DTC) to execute data transfer
- Module stop mode can be set
- As the initial setting, SCI operation is halted. Register access is enabled by exiting module stop mode.

### 12.1.2 Block Diagram

Figure 12.1 shows a block diagram of the SCI.

Figure 12.1 Block Diagram of SCI

### 12.1.3 Pin Configuration

Table 12.1 shows the serial pins for each SCI channel.
Table 12.1 SCI Pins

| Channel | Pin Name | Symbol | I/O | Function |
| :---: | :---: | :---: | :---: | :---: |
| 0 | Serial clock pin 0 | SCK0 | I/O | SCIO clock input/output |
|  | Receive data pin 0 | RxD0 | Input | SCIO receive data input |
|  | Transmit data pin 0 | TxD0 | Output | SCIO transmit data output |
| 1 | Serial clock pin 1 | SCK1 | I/O | SCl1 clock input/output |
|  | Receive data pin 1 | RxD1 | Input | SCl1 receive data input |
|  | Transmit data pin 1 | TxD1 | Output | SCl1 transmit data output |
| 2 | Serial clock pin 2 | SCK2 | I/O | SCl2 clock input/output |
|  | Receive data pin 2 | RxD2 | Input | SCl2 receive data input |
|  | Transmit data pin 2 | TxD2 | Output | SCl2 transmit data output |

### 12.1.4 Register Configuration

The SCI has the internal registers shown in table 12.2. These registers are used to specify asynchronous mode or clocked synchronous mode, the data format, and the bit rate, and to control transmitter/receiver.

Table 12.2 SCI Registers

| Channel | Name | Abbreviation | R/W | Initial Value | Address** |
| :---: | :---: | :---: | :---: | :---: | :---: |
| 0 | Serial mode register 0 | SMR 0 | R/W | $\mathrm{H}^{\prime} 00$ | H'FF78 |
|  | Bit rate register 0 | BRR 0 | R/W | H'FF | H'FF79 |
|  | Serial control register 0 | SCR 0 | R/W | $\mathrm{H}^{\prime} 00$ | H'FF7A |
|  | Transmit data register 0 | TDR 0 | R/W | H'FF | H'FF7B |
|  | Serial status register 0 | SSR 0 | $\mathrm{R} /(\mathrm{W})^{*}{ }^{2}$ | H'84 | H'FF7C |
|  | Receive data register 0 | RDR 0 | R | H'00 | H'FF7D |
|  | Smart card mode register 0 | SCMR0 | R/W | H'F2 | H'FF7E |
| 1 | Serial mode register 1 | SMR1 | R/W | H'00 | H'FF80 |
|  | Bit rate register 1 | BRR1 | R/W | H'FF | H'FF81 |
|  | Serial control register 1 | SCR1 | R/W | $\mathrm{H}^{\prime} 00$ | H'FF82 |
|  | Transmit data register 1 | TDR1 | R/W | H'FF | H'FF83 |
|  | Serial status register 1 | SSR1 | $\mathrm{R} /(\mathrm{W})^{*}{ }^{2}$ | H'84 | H'FF84 |
|  | Receive data register 1 | RDR1 | R | $\mathrm{H}^{\prime} 00$ | H'FF85 |
|  | Smart card mode register 1 | SCMR1 | R/W | H'F2 | H'FF86 |
| 2 | Serial mode register 2 | SMR2 | R/W | $\mathrm{H}^{\prime} 00$ | H'FF88 |
|  | Bit rate register 2 | BRR2 | R/W | H'FF | H'FF89 |
|  | Serial control register 2 | SCR2 | R/W | $\mathrm{H}^{\prime} 00$ | H'FF8A |
|  | Transmit data register 2 | TDR2 | R/W | H'FF | H'FF8B |
|  | Serial status register 2 | SSR2 | $\mathrm{R} / \mathrm{W})^{*}{ }^{2}$ | H'84 | H'FF8C |
|  | Receive data register 2 | RDR2 | R | H'00 | H'FF8D |
|  | Smart card mode register 2 | SCMR2 | R/W | H'F2 | H'FF8E |
| All | Module stop control register | MSTPCR | R/W | H'3FFF | H'FF3C |

Notes: 1. Lower 16 bits of the address.
2. Can only be written with 0 for flag clearing.

### 12.2 Register Descriptions

### 12.2.1 Receive Shift Register (RSR)

RSR is a register used to receive serial data.

The SCI sets serial data input from the RxD pin in RSR in the order received, starting with the LSB (bit 0), and converts it to parallel data. When one byte of data has been received, it is transferred to RDR automatically.

RSR cannot be directly read or written to by the CPU.

### 12.2.2 Receive Data Register (RDR)

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Initial value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R |

RDR is a register that stores received serial data.

When the SCI has received one byte of serial data, it transfers the received serial data from RSR to RDR where it is stored, and completes the receive operation. After this, RSR is receive-enabled.

Since RSR and RDR function as a double buffer in this way, enables continuous receive operations to be performed.

RDR is a read-only register, and cannot be written to by the CPU.

RDR is initialized to $\mathrm{H}^{\prime} 00$ by a reset, and in standby mode or module stop mode.

### 12.2.3 Transmit Shift Register (TSR)

TSR is a register used to transmit serial data.
To perform serial data transmission, the SCI first transfers transmit data from TDR to TSR, then sends the data to the TxD pin starting with the LSB (bit 0).

When transmission of one byte is completed, the next transmit data is transferred from TDR to TSR, and transmission started, automatically. However, data transfer from TDR to TSR is not performed if the TDRE bit in SSR is set to 1 .

TSR cannot be directly read or written to by the CPU .

### 12.2.4 Transmit Data Register (TDR)

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Initial value | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

TDR is an 8-bit register that stores data for serial transmission.
When the SCI detects that TSR is empty, it transfers the transmit data written in TDR to TSR and starts serial transmission. Continuous serial transmission can be carried out by writing the next transmit data to TDR during serial transmission of the data in TSR.

TDR can be read or written to by the CPU at all times.
TDR is initialized to H'FF by a reset, and in standby mode or module stop mode.

### 12.2.5 Serial Mode Register (SMR)

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | C/A | CHR | PE | O/E | STOP | MP | CKS1 | CKSO |
| Initial value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

SMR is an 8-bit register used to set the SCI's serial transfer format and select the baud rate generator clock source.

SMR can be read or written to by the CPU at all times.
SMR is initialized to $\mathrm{H}^{\prime} 00$ by a reset, and in standby mode or module stop mode.
Bit 7—Communication Mode (C/ $\overline{\mathbf{A}}$ ): Selects asynchronous mode or clocked synchronous mode as the SCI operating mode.

## Bit 7

| $\mathbf{C} / \overline{\mathbf{A}}$ | Description |  |
| :--- | :--- | :--- |
| 0 | Asynchronous mode | (Initial value) |
| 1 | Clocked synchronous mode |  |

Bit 6—Character Length (CHR): Selects 7 or 8 bits as the data length in asynchronous mode. In clocked synchronous mode, a fixed data length of 8 bits is used regardless of the CHR setting.

## Bit 6

| CHR | Description |  |
| :--- | :--- | :--- |
| 0 | 8-bit data | (Initial value) |
| 1 | 7-bit data* |  |
| Note: | * | When 7-bit data is selected, the MSB (bit 7) of TDR is not transmitted, and it is not <br> possible to choose between LSB-first or MSB-first transfer. |

Bit 5—Parity Enable (PE): In asynchronous mode, selects whether or not parity bit addition is performed in transmission, and parity bit checking in reception. In clocked synchronous mode, parity bit addition and checking is not performed, regardless of the PE bit setting.

## Bit 5

| PE | Description |  |
| :--- | :--- | :--- |
| 0 | Parity bit addition and checking disabled | (Initial value) |
| 1 | Parity bit addition and checking enabled* |  |
| Note: | *When the PE bit is set to 1, the parity (even or odd) specified by the O/E bit is added to <br> transmit data before transmission. In reception, the parity bit is checked for the parity <br> (even or odd) specified by the $\mathrm{O} / \overline{\mathrm{E}}$ bit. |  |

Bit 4—Parity Mode (O/ $\overline{\mathrm{E}}$ ): Selects either even or odd parity for use in parity addition and checking.

The $\mathrm{O} / \overline{\mathrm{E}}$ bit setting is only valid when the PE bit is set to 1 , enabling parity bit addition and checking, in asynchronous mode. The $\mathrm{O} / \overline{\mathrm{E}}$ bit setting is invalid in clocked synchronous mode, and when parity addition and checking is disabled in asynchronous mode.

## Bit 4

$\overline{0 / \bar{E}}$ Description

| 0 | Even parity** (Initial value) |
| :---: | :---: |
| 1 | Odd parity*2 |
| Notes: 1. | When even parity is set, parity bit addition is performed in transmission so that the total number of 1 bits in the transmit character plus the parity bit is even. In reception, a check is performed to see if the total number of 1 bits in the receive character plus the parity bit is even. |

2. When odd parity is set, parity bit addition is performed in transmission so that the total number of 1 bits in the transmit character plus the parity bit is odd.
In reception, a check is performed to see if the total number of 1 bits in the receive character plus the parity bit is odd.

Bit 3-Stop Bit Length (STOP): Selects 1 or 2 bits as the stop bit length in asynchronous mode. The STOP bits setting is only valid in asynchronous mode. If clocked synchronous mode is set the STOP bit setting is invalid since stop bits are not added.

Bit 3

| STOP | Description |
| :--- | :--- |
| 0 | 1 stop bit: In transmission, a single 1 bit (stop bit) is added to the end of a transmit <br> character before it is sent. |
| 1 | 2 stop bits: In transmission, two 1 bits (stop bits) are added to the end of a transmit <br> character before it is sent. |

In reception, only the first stop bit is checked, regardless of the STOP bit setting. If the second stop bit is 1 , it is treated as a stop bit; if it is 0 , it is treated as the start bit of the next transmit character.

Bit 2—Multiprocessor Mode (MP): Selects multiprocessor format. When multiprocessor format is selected, the PE bit and $\mathrm{O} / \overline{\mathrm{E}}$ bit parity settings are invalid. The MP bit setting is only valid in asynchronous mode; it is invalid in clocked synchronous mode.

For details of the multiprocessor communication function, see section 12.3.3, Multiprocessor Communication Function.

Bit 2

| MP | Description |  |
| :--- | :--- | :--- |
| 0 | Multiprocessor function disabled | (Initial value) |
| 1 | Multiprocessor format selected |  |

Bits 1 and 0—Clock Select 1 and 0 (CKS1, CKS0): These bits select the clock source for the baud rate generator. The clock source can be selected from $\phi, \phi / 4, \phi / 16$, and $\phi / 64$, according to the setting of bits CKS1 and CKS0.

For the relation between the clock source, the bit rate register setting, and the baud rate, see section 12.2.8, Bit Rate Register (BRR).

| Bit $\mathbf{1}$ | Bit $\mathbf{0}$ |  |  |
| :--- | :--- | :--- | :--- |
| CKS1 | CKS0 | Description |  |
| 0 | 0 | $\phi$ clock | (Initial value) |
|  | 1 | $\phi / 4$ clock |  |
| 1 | 0 | $\phi / 16$ clock |  |
| 1 | $\phi / 64$ clock |  |  |

### 12.2.6 Serial Control Register (SCR)

| Bit | $:$ | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | TIE | RIE | TE | RE | MPIE | TEIE | CKE1 | CKE0 |
|  | Initial value : | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | $:$ | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

SCR is a register that performs enabling or disabling of SCI transfer operations, serial clock output in asynchronous mode, and interrupt requests, and selection of the serial clock source.

SCR can be read or written to by the CPU at all times.
SCR is initialized to $\mathrm{H}^{\prime} 00$ by a reset, and in standby mode or module stop mode.
Bit 7—Transmit Interrupt Enable (TIE): Enables or disables transmit data empty interrupt (TXI) request generation when serial transmit data is transferred from TDR to TSR and the TDRE flag in SSR is set to 1 .

## Bit 7

TIE Description

| 0 | Transmit data empty interrupt (TXI) requests disabled* | (Initial value) |  |
| :--- | :--- | :--- | :--- |
| 1 |  | Transmit data empty interrupt (TXI) requests enabled |  |
| Note: | $*$ | TXI interrupt request cancellation can be performed by reading 1 from the TDRE flag, <br> then clearing it to 0, or clearing the TIE bit to 0. |  |

Bit 6-Receive Interrupt Enable (RIE): Enables or disables receive data full interrupt (RXI) request and receive error interrupt (ERI) request generation when serial receive data is transferred from RSR to RDR and the RDRF flag in SSR is set to 1.

Bit 6

| RIE | Description |
| :--- | :--- |
| 0 | Receive data full interrupt (RXI) request and receive error interrupt (ERI) request <br> disabled* |
| 1 | Receive data full interrupt (RXI) request and receive error interrupt (ERI) request <br> enabled |
| Note: | * |
|  | RXI and ERI interrupt request cancellation can be performed by reading 1 from the <br> RDRF flag, or the FER, PER, or ORER flag, then clearing the flag to 0 , or clearing the <br> RIE bit to 0. |
|  |  |

Bit 5-Transmit Enable (TE): Enables or disables the start of serial transmission by the SCI.

## Bit 5

Bit 4—Receive Enable (RE): Enables or disables the start of serial reception by the SCI.

## Bit 4

RE Description

| 0 | Reception disabled*1 | (Initial value) |
| :--- | :--- | :---: |
| 1 | Reception enabled* ${ }^{2}$ |  |

Notes: 1. Clearing the RE bit to 0 does not affect the RDRF, FER, PER, and ORER flags, which retain their states.
2. Serial reception is started in this state when a start bit is detected in asynchronous mode or serial clock input is detected in clocked synchronous mode.
SMR setting must be performed to decide the transfer format before setting the RE bit to 1 .

Bit 3—Multiprocessor Interrupt Enable (MPIE): Enables or disables multiprocessor interrupts. The MPIE bit setting is only valid in asynchronous mode when the MP bit in SMR is set to 1 .

The MPIE bit setting is invalid in clocked synchronous mode or when the MP bit is cleared to 0 .
Bit 3
MPIE Description

| 0 | Multiprocessor interrupts disabled (normal reception performed) | (Initial value) |
| :--- | :--- | :--- |
| [Clearing conditions] |  |  |

- When the MPIE bit is cleared to 0
- When MPB = 1 data is received

1 Multiprocessor interrupts enabled*
Receive interrupt (RXI) requests, receive error interrupt (ERI) requests, and setting of the RDRF, FER, and ORER flags in SSR are disabled until data with the multiprocessor bit set to 1 is received.
Note: * When receive data including MPB $=0$ is received, receive data transfer from RSR to RDR, receive error detection, and setting of the RDRF, FER, and ORER flags in SSR, is not performed. When receive data including MPB $=1$ is received, the MPB bit in SSR is set to 1 , the MPIE bit is cleared to 0 automatically, and generation of RXI and ERI interrupts (when the TIE and RIE bits in SCR are set to 1) and FER and ORER flag setting is enabled.

Bit 2—Transmit End Interrupt Enable (TEIE): Enables or disables transmit end interrupt (TEI) request generation when there is no valid transmit data in TDR in MSB data transmission.

Bit 2
TEIE Description

| 0 | Transmit end interrupt (TEI) request disabled* | (Initial value) |
| :--- | :--- | :--- |
| 1 | Transmit end interrupt (TEI) request enabled |  |
| Note: | * | TEI cancellation can be performed by reading 1 from the TDRE flag in SSR, then <br> clearing it to 0 and clearing the TEND flag to 0, or clearing the TEIE bit to 0. |

Bits 1 and 0-Clock Enable 1 and $\mathbf{0}$ (CKE1, CKE0): These bits are used to select the SCI clock source and enable or disable clock output from the SCK pin. The combination of the CKE1 and CKE0 bits determines whether the SCK pin functions as an I/O port, the serial clock output pin, or the serial clock input pin.

The setting of the CKE0 bit, however, is only valid for internal clock operation $($ CKE1 $=0)$ in asynchronous mode. The CKE0 bit setting is invalid in clocked synchronous mode, and in the case of external clock operation (CKE1 = 1). Note that the SCI's operating mode must be decided using SMR before setting the CKE1 and CKE0 bits.

For details of clock source selection, see table 12.9.

| Bit 1 | Bit $\mathbf{0}$ |  |  |
| :--- | :--- | :--- | :--- |
| CKE1 | CKE0 | Description |  |
| 0 | 0 | Asynchronous mode | Clocked synchronous <br> mode | | Internal clock/SCK pin functions as I/O port*1 |
| :--- |
|  |

Notes: 1. Initial value
2. Outputs a clock of the same frequency as the bit rate.
3. Inputs a clock with a frequency 16 times the bit rate.

### 12.2.7 Serial Status Register (SSR)

| Bit | 7 6 |  | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | TDRE | RDRF | ORER | FER | PER | TEND | MPB | MPBT |
| Initial value | 1 | 0 | 0 | 0 | 0 | 1 | 0 | 0 |
| R/W | R/(W)* | $\mathrm{R} / \mathrm{W})^{*}$ | R/(W)* | $\mathrm{R} / \mathrm{W})^{*}$ | $\mathrm{R} /(\mathrm{W})^{*}$ | R | R | R/W |

Note: * Only 0 can be written, to clear the flag.

SSR is an 8-bit register containing status flags that indicate the operating status of the SCI, and multiprocessor bits.

SSR can be read or written to by the CPU at all times. However, 1 cannot be written to flags TDRE, RDRF, ORER, PER, and FER. Also note that in order to clear these flags they must be read as 1 beforehand. The TEND flag and MPB flag are read-only flags and cannot be modified.

SSR is initialized to $\mathrm{H}^{\prime} 84$ by a reset, and in standby mode or module stop mode.
Bit 7—Transmit Data Register Empty (TDRE): Indicates that data has been transferred from TDR to TSR and the next serial data can be written to TDR.

Bit 7
TDRE Description
0 [Clearing conditions]

- When 0 is written to TDRE after reading TDRE $=1$
- When the DTC* is activated by a TXI interrupt and write data to TDR
[Setting conditions]
(Initial value)
- When the TE bit in SCR is 0
- When data is transferred from TDR to TSR and data can be written to TDR

Note: * DTC can clear this bit only when DISEL is 0 with the transfer counter not being 0 .

Bit 6-Receive Data Register Full (RDRF): Indicates that the received data is stored in RDR.

## Bit 6

RDRF Description
0 [Clearing conditions]

- When 0 is written to RDRF after reading RDRF $=1$
- When the DTC* is activated by an RXI interrupt and read data from RDR
1 [Setting condition]

When serial reception ends normally and receive data is transferred from RSR to RDR
Notes: RDR and the RDRF flag are not affected and retain their previous values when an error is detected during reception or when the RE bit in SCR is cleared to 0 .
If reception of the next data is completed while the RDRF flag is still set to 1 , an overrun error will occur and the receive data will be lost.

* DTC can clear this bit only when DISEL is 0 with the transfer counter not being 0 .

Bit 5—Overrun Error (ORER): Indicates that an overrun error occurred during reception, causing abnormal termination.

## Bit 5

ORER Description

| 0 | [Clearing condition] | (Initial value)** |
| :--- | :--- | :--- |
|  | When 0 is written to ORER after reading ORER $=1$ |  |
| 1 | [Setting condition] |  |
|  | When the next serial reception is completed while RDRF $=1 *^{2}$ |  |

Notes: 1. The ORER flag is not affected and retains its previous state when the RE bit in SCR is cleared to 0 .
2. The receive data prior to the overrun error is retained in RDR, and the data received subsequently is lost. Also, subsequent serial reception cannot be continued while the ORER flag is set to 1 . In clocked synchronous mode, serial transmission cannot be continued, either.

Bit 4-Framing Error (FER): Indicates that a framing error occurred during reception in asynchronous mode, causing abnormal termination.

## Bit 4

$\overline{\text { FER Description }}$

| 0 | [Clearing condition] | (Initial value)*1 |
| :--- | :--- | :--- |
|  | When 0 is written to FER after reading FER $=1$ |  |
| 1 | [Setting condition] |  |
|  | When the SCl checks the stop bit at the end of the receive data when reception ends, <br> and the stop bit is $0 *^{2}$ |  |

Notes: 1. The FER flag is not affected and retains its previous state when the RE bit in SCR is cleared to 0 .
2. In 2-stop-bit mode, only the first stop bit is checked for a value of 0 ; the second stop bit is not checked. If a framing error occurs, the receive data is transferred to RDR but the RDRF flag is not set. Also, subsequent serial reception cannot be continued while the FER flag is set to 1 . In clocked synchronous mode, serial transmission cannot be continued, either.

Bit 3-Parity Error (PER): Indicates that a parity error occurred during reception using parity addition in asynchronous mode, causing abnormal termination.

## Bit 3

PER Description
0 [Clearing condition]

When 0 is written to PER after reading PER $=1$
1 [Setting condition]
When, in reception, the number of 1 bits in the receive data plus the parity bit does not match the parity setting (even or odd) specified by the O/E bit in SMR*2
Notes: 1. The PER flag is not affected and retains its previous state when the RE bit in SCR is cleared to 0 .
2. If a parity error occurs, the receive data is transferred to RDR but the RDRF flag is not set. Also, subsequent serial reception cannot be continued while the PER flag is set to 1. In clocked synchronous mode, serial transmission cannot be continued, either.

Bit 2-Transmit End (TEND): Indicates that there is no valid data in TDR when the last bit of the transmit character is sent, and transmission has been ended.

The TEND flag is read-only and cannot be modified.

## Bit 2

TEND Description
0 [Clearing conditions]

- When 0 is written to TDRE after reading TDRE $=1$
- When the DTC* is activated by a TXI interrupt and write data to TDR
[Setting conditions]
(Initial value)
- When the TE bit in SCR is 0
- When TDRE $=1$ at transmission of the last bit of a 1 -byte serial transmit character

Note: * DTC can clear this bit only when DISEL is 0 with the transfer counter not being 0 .

Bit 1—Multiprocessor bit (MPB): When reception is performed using multiprocessor format in asynchronous mode, MPB stores the multiprocessor bit in the receive data.

MPB is a read-only bit, and cannot be modified.

## Bit 1

MPB Description

| 0 | [Clearing condition] | (Initial value)* |
| :--- | :--- | :--- |
|  | When data with a 0 multiprocessor bit is received |  |
| 1 | [Setting condition] |  |
| Note: | *hen data with a 1 multiprocessor bit is received | Retains its previous state when the RE bit in SCR is cleared to 0 with multiprocessor <br> format. |

Bit 0-Multiprocessor Bit Transfer (MPBT): When transmission is performed using multiprocessor format in asynchronous mode, MPBT stores the multiprocessor bit to be added to the transmit data.

The MPBT bit setting is invalid in clocked synchronous mode, when multiprocessor format is not used, and when the operation is not transmission.

Bit 0
MPBT Description

| 0 | Data with a 0 multiprocessor bit is transmitted | (Initial value) |
| :--- | :--- | :--- |
| 1 | Data with a 1 multiprocessor bit is transmitted |  |

### 12.2.8 Bit Rate Register (BRR)

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Initial value | 1 | 1 | 1 | 1 | 1 | 1 | 1 | 1 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

BRR is an 8-bit register that sets the serial transfer bit rate in accordance with the baud rate generator operating clock selected by bits CKS1 and CKS0 in SMR.

BRR can be read or written to by the CPU at all times.
BRR is initialized to H'FF by a reset, and in standby mode or module stop mode.

As baud rate generator control is performed independently for each channel, different values can be set for each channel.

Table 12.3 shows sample BRR settings in asynchronous mode, and table 12.4 shows sample BRR settings in clocked synchronous mode.

Section 12 Serial Communication Interface (SCI)
Table 12.3 BRR Settings for Various Bit Rates (Asynchronous Mode)

| Bit Rate (bit/s) | $\phi(\mathrm{MHz})$ |  |  |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | 2 |  |  | 2.097152 |  |  | 2.4576 |  |  | 3 |  |  |
|  | n | N | Error <br> (\%) | n | N | Error <br> (\%) | n | N | Error <br> (\%) | n | N | Error <br> (\%) |

Legend:
Blank: Cannot be set.
-: Can be set, but there will be a degree of error.
*: Continuous transmission/reception is not possible.
Note: As far as possible, the setting should be made so that the error is no more than $1 \%$.

The BRR setting is found from the following formulas.

Asynchronous mode:

$$
\mathrm{N}=\frac{\phi}{64 \times 2^{2 \mathrm{n}-1} \times \mathrm{B}} \times 10^{6}-1
$$

Clocked synchronous mode:

$$
\mathrm{N}=\frac{\phi}{8 \times 2^{2 \mathrm{n}-1} \times \mathrm{B}} \times 10^{6}-1
$$

Where
B: Bit rate (bit/s)
N : BRR setting for baud rate generator $(0 \leq \mathrm{N} \leq 255)$
$\phi$ : Operating frequency $(\mathrm{MHz})$
n : Baud rate generator input clock $(\mathrm{n}=0$ to 3 )
(See the table below for the relation between n and the clock.)

|  |  | SMR Setting |  |
| :--- | :--- | :--- | :--- |
| $n$ | Clock | CKS1 | CKS0 |
| 0 | $\phi$ | 0 | 0 |
| 1 | $\phi / 4$ | 0 | 1 |
| 2 | $\phi / 16$ | 1 | 0 |
| 3 | $\phi / 64$ | 1 | 1 |

The bit rate error in asynchronous mode is found from the following formula:
Error $(\%)=\left\{\frac{\phi \times 10^{6}}{(N+1) \times B \times 64 \times 2^{2 n-1}}-1\right\} \times 100$

Table 12.5 shows the maximum bit rate for each frequency in asynchronous mode. Tables 12.6 and 12.7 show the maximum bit rates with external clock input.

### 12.2.9 Smart Card Mode Register (SCMR)

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | - | SDIR | SINV | - | SMIF |
| Initial value | 1 | 1 | 1 | 1 | 0 | 0 | 1 | 0 |
| R/W | - | - | - | - | R/W | R/W | - | R/W |

SCMR selects LSB-first or MSB-first by means of bit SDIR. With an 8-bit length, LSB-first or MSB-first transfer can be selected regardless of the serial communication mode. The descriptions in this chapter refer to LSB-first transfer.

For details of the other bits in SCMR, see 13.2.1, Smart Card Mode Register (SCMR).

SCMR is initialized to H'F2 by a reset, and in standby mode or module stop mode.
Bits 7 to 4—Reserved: Read-only bits, always read as 1.
Bit 3—Smart Card Data Transfer Direction (SDIR): Selects the serial/parallel conversion format.

The transfer format is valid for 8-bit data.

Bit 3

| SDIR | Description | (Initial value) |
| :--- | :--- | :--- |
| 0 | TDR contents are transmitted LSB-first |  |
| 1 | Receive data is stored in RDR LSB-first |  |
|  | TDR contents are transmitted MSB-first |  |
|  | Receive data is stored in RDR MSB-first |  |

Bit 2—Smart Card Data Invert (SINV): When the smart card interface operates as a normal SCI, 0 should be written in this bit.

Bit 1—Reserved: Read-only bit, always read as 1.
Bit 0—Smart Card Interface Mode Select (SMIF): When the smart card interface operates as a normal SCI, 0 should be written in this bit.

### 12.2.10 Module Stop Control Register (MSTPCR)

R/W : R/W R/W R/W R/W R/W R/W R/W R/W R/W R/W R/W R/W R/W R/W R/W R/W

MSTPCR is a 16-bit readable/writable register that performs module stop mode control.
When the corresponding bit of bits MSTP7 to MSTP5 is set to 1, SCI operation stops at the end of the bus cycle and a transition is made to module stop mode. For details, see section 18.5, Module Stop Mode.

MSTPCR is initialized to H'3FFF by a reset and in hardware standby mode. It is not initialized in software standby mode.

Bit 7—Module Stop (MSTP7): Specifies the SCI channel 2 module stop mode.
Bit 7

| MSTP7 | Description |  |
| :--- | :--- | :--- |
| 0 | SCI channel 2 module stop mode cleared |  |
| 1 | SCI channel 2 module stop mode set | (Initial value) |

Bit 6—Module Stop (MSTP6): Specifies the SCI channel 1 module stop mode.

## Bit 6

MSTP6 Description

| 0 | SCI channel 1 module stop mode cleared |  |
| :--- | :--- | :--- |
| 1 | SCI channel 1 module stop mode set | (Initial value) |

Bit 5—Module Stop (MSTP5): Specifies the SCI channel 0 module stop mode.

## Bit 5

| MSTP5 | Description |  |
| :--- | :--- | :--- |
| 0 | SCI channel 0 module stop mode cleared |  |
| 1 | SCI channel 0 module stop mode set | (Initial value) |

### 12.3 Operation

### 12.3.1 Overview

The SCI can carry out serial communication in two modes: asynchronous mode in which synchronization is achieved character by character, and clocked synchronous mode in which synchronization is achieved with clock pulses.

Selection of asynchronous or clocked synchronous mode and the transmission format is made using SMR as shown in table 12.8 . The SCI clock is determined by a combination of the C/ $\overline{\mathrm{A}}$ bit in SMR and the CKE1 and CKE0 bits in SCR, as shown in table 12.9.

Asynchronous mode:

- Data length: Choice of 7 or 8 bits
- Choice of parity addition, multiprocessor bit addition, and addition of 1 or 2 stop bits (the combination of these parameters determines the transfer format and character length)
- Detection of framing, parity, and overrun errors, and breaks, during reception
- Choice of internal or external clock as SCI clock source
- When internal clock is selected:

The SCI operates on the baud rate generator clock and a clock with the same frequency as the bit rate can be output

- When external clock is selected:

A clock with a frequency of 16 times the bit rate must be input (the on-chip baud rate generator is not used)

Clocked synchronous mode:

- Transfer format: Fixed 8-bit data
- Detection of overrun errors during reception
- Choice of internal or external clock as SCI clock source
- When internal clock is selected:

The SCI operates on the baud rate generator clock and a serial clock is output off-chip

- When external clock is selected:

The on-chip baud rate generator is not used, and the SCI operates on the input serial clock

Table 12.8 SMR Settings and Serial Transfer Format Selection

| SMR Settings |  |  |  |  | Mode | SCI Transfer Format |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Bit 7 | Bit 6 | Bit 2 | Bit 5 | Bit 3 |  | Data Length | Multiprocessor Bit | Parity Bit | Stop Bit Length |
| C/ $\bar{A}$ | CHR | MP | PE | STOP |  |  |  |  |  |
| 0 | 0 | 0 | 0 | 0 | Asynchronous mode | 8-bit data | No | No | 1 bit |
|  |  |  |  | 1 |  |  |  |  | 2 bits |
|  |  |  | 1 | 0 |  |  |  | Yes | 1 bit |
|  |  |  |  | 1 |  |  |  |  | 2 bits |
|  | 1 |  | 0 | 0 |  | 7-bit data |  | No | 1 bit |
|  |  |  |  | 1 |  |  |  |  | 2 bits |
|  |  |  | 1 | 0 |  |  |  | Yes | 1 bit |
|  |  |  |  | 1 |  |  |  |  | 2 bits |
|  | 0 | 1 | - | 0 | Asynchronous mode (multiprocessor format) | 8-bit data | Yes | No | 1 bit |
|  |  |  | - | 1 |  |  |  |  | 2 bits |
|  | 1 |  | - | 0 |  | 7-bit data |  |  | 1 bit |
|  |  |  | - | 1 |  |  |  |  | 2 bits |
| 1 | - | - | - | - | Clocked synchronous mode | 8-bit data | No |  | None |

Table 12.9 SMR and SCR Settings and SCI Clock Source Selection

| SMR | SCR Setting |  | Mode | SCI Transmit/Receive clock |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
| Bit 7 | Bit 1 | Bit 0 |  | Clock Source | SCK Pin Function |
| $\bar{C} / \overline{\text { A }}$ | CKE1 | CKEO |  |  |  |
| 0 | 0 | 0 | Asynchronous mode | Internal | SCI does not use SCK pin |
|  |  | 1 |  |  | Outputs clock with same frequency as bit rate |
|  | 1 | 0 |  | External | Inputs clock with frequency of 16 times the bit rate |
|  |  | 1 |  |  |  |
| 1 | 0 | 0 | Clocked synchronous mode | Internal | Outputs the serial clock |
|  |  | 1 |  |  |  |
|  | 1 | 0 |  | External | Inputs the serial clock |
|  |  | 1 |  |  |  |

### 12.3.2 Operation in Asynchronous Mode

In asynchronous mode, characters are sent or received, each preceded by a start bit indicating the start of communication and one or two stop bits indicating the end of communication. Serial communication is thus carried out with synchronization established on a character-by-character basis.

Inside the SCI, the transmitter and receiver are independent units, enabling full-duplex communication. Both the transmitter and the receiver also have a double-buffered structure, so that data can be read or written during transmission or reception, enabling continuous data transfer.

Figure 12.2 shows the general format for asynchronous serial communication.
In asynchronous serial communication, the transmission line is usually held in the mark state (high level). The SCI monitors the transmission line, and when it goes to the space state (low level), recognizes a start bit and starts serial communication.

One serial communication character consists of a start bit (low level), followed by data (in LSBfirst order), a parity bit (high or low level), and finally one or two stop bits (high level).

In asynchronous mode, the SCI performs synchronization at the falling edge of the start bit in reception. The SCI samples the data on the 8th pulse of a clock with a frequency of 16 times the length of one bit, so that the transfer data is latched at the center of each bit.

Figure 12.2 Data Format in Asynchronous Communication (Example with 8-Bit Data, Parity, Two Stop Bits)

## Data Transfer Format

Table 12.10 shows the data transfer formats that can be used in asynchronous mode. Any of 12 transfer formats can be selected according to the SMR setting.

Table 12.10 Serial Transfer Formats (Asynchronous Mode)

Legend:
S: Start bit
STOP: Stop bit
P: Parity bit
MPB: Multiprocessor bit

## Clock

Either an internal clock generated by the on-chip baud rate generator or an external clock input at the SCK pin can be selected as the SCI's serial clock, according to the setting of the C/ $\overline{\mathrm{A}}$ bit in SMR and the CKE1 and CKE0 bits in SCR. For details of SCI clock source selection, see table 12.9.

When an external clock is input at the SCK pin, the clock frequency should be 16 times the bit rate used.

When the SCI is operated on an internal clock, the clock can be output from the SCK pin. The frequency of the clock output in this case is equal to the bit rate, and the phase is such that the rising edge of the clock is in the middle of the transmit data, as shown in figure 12.3.

Figure 12.3 Relation between Output Clock and Transfer Data Phase (Asynchronous Mode)

## Data Transfer Operations

SCI initialization (asynchronous mode): Before transmitting and receiving data, you should first clear the TE and RE bits in SCR to 0 , then initialize the SCI as described below.

When the operating mode, transfer format, etc., is changed, the TE and RE bits must be cleared to 0 before making the change using the following procedure. When the TE bit is cleared to 0 , the TDRE flag is set to 1 and TSR is initialized. Note that clearing the RE bit to 0 does not change the contents of the RDRF, PER, FER, and ORER flags, or the contents of RDR.

When an external clock is used the clock should not be stopped during operation, including initialization, since operation is uncertain.

Figure 12.4 shows a sample SCI initialization flowchart.

Figure 12.4 Sample SCI Initialization Flowchart

Serial data transmission (asynchronous mode): Figure 12.5 shows a sample flowchart for serial transmission.

The following procedure should be used for serial data transmission.

Figure 12.5 Sample Serial Transmission Flowchart

In serial transmission, the SCI operates as described below.
[1] The SCI monitors the TDRE flag in SSR, and if is 0 , recognizes that data has been written to TDR, and transfers the data from TDR to TSR.
[2] After transferring data from TDR to TSR, the SCI sets the TDRE flag to 1 and starts transmission.

If the TIE bit is set to 1 at this time, a transmit data empty interrupt (TXI) is generated.
The serial transmit data is sent from the TxD pin in the following order.
[a] Start bit:
One 0-bit is output.
[b] Transmit data:
8-bit or 7-bit data is output in LSB-first order.
[c] Parity bit or multiprocessor bit:
One parity bit (even or odd parity), or one multiprocessor bit is output.
A format in which neither a parity bit nor a multiprocessor bit is output can also be selected.
[d] Stop bit(s):
One or two 1-bits (stop bits) are output.
[e] Mark state:
1 is output continuously until the start bit that starts the next transmission is sent.
[3] The SCI checks the TDRE flag at the timing for sending the stop bit.
If the TDRE flag is cleared to 0 , the data is transferred from TDR to TSR, the stop bit is sent, and then serial transmission of the next frame is started.
If the TDRE flag is set to 1 , the TEND flag in SSR is set to 1 , the stop bit is sent, and then the "mark state" is entered in which 1 is output continuously. If the TEIE bit in SCR is set to 1 at this time, a TEI interrupt request is generated.

Figure 12.6 shows an example of the operation for transmission in asynchronous mode.

Figure 12.6 Example of Operation in Transmission in Asynchronous Mode (Example with 8-Bit Data, Parity, One Stop Bit)

Serial data reception (asynchronous mode): Figure 12.7 shows a sample flowchart for serial reception.

The following procedure should be used for serial data reception.

Note: * The case, in which the DTC automatically clears the RDRF flag, occurs only when DISEL in DTC is 0 with the transfer counter not being 0 . Therefore, the RDRF flag should be cleared by CPU when DISEL is 1 , or when DISEL is 0 with the transfer counter being 0 .

Figure 12.7 Sample Serial Reception Data Flowchart

Figure 12.7 Sample Serial Reception Data Flowchart (cont)

In serial reception, the SCI operates as described below.
[1] The SCI monitors the transmission line, and if a 0 stop bit is detected, performs internal synchronization and starts reception.
[2] The received data is stored in RSR in LSB-to-MSB order.
[3] The parity bit and stop bit are received.
After receiving these bits, the SCI carries out the following checks.
[a] Parity check:
The SCI checks whether the number of 1 bits in the receive data agrees with the parity (even or odd) set in the $O / \bar{E}$ bit in SMR.
[b] Stop bit check:
The SCI checks whether the stop bit is 1 .
If there are two stop bits, only the first is checked.
[c] Status check:
The SCI checks whether the RDRF flag is 0 , indicating that the receive data can be transferred from RSR to RDR.

If all the above checks are passed, the RDRF flag is set to 1 , and the receive data is stored in RDR.

If a receive error* is detected in the error check, the operation is as shown in table 12.11 .

Note: * Subsequent receive operations cannot be performed when a receive error has occurred. Also note that the RDRF flag is not set to 1 in reception, and so the error flags must be cleared to 0 .
[4] If the RIE bit in SCR is set to 1 when the RDRF flag changes to 1 , a receive data full interrupt (RXI) request is generated.
Also, if the RIE bit in SCR is set to 1 when the ORER, PER, or FER flag changes to 1 , a receive error interrupt (ERI) request is generated.

Table 12.11 Receive Errors and Conditions for Occurrence

| Receive Error | Abbreviation | Occurrence Condition | Data Transfer |
| :--- | :--- | :--- | :--- |
| Overrun error | ORER | When the next data reception is <br> completed while the RDRF flag <br> in SSR is set to 1 | Receive data is not <br> transferred from RSR to |
| Framing error | FER | When the stop bit is 0 | Receive data is transferred <br> from RSR to RDR. |
| Parity error | PER | When the received data differs <br> from the parity (even or odd) set <br> in SMR | Receive data is transferred <br> from RSR to RDR. |

Figure 12.8 shows an example of the operation for reception in asynchronous mode.

Figure 12.8 Example of SCI Operation in Reception (Example with 8-Bit Data, Parity, One Stop Bit)

### 12.3.3 Multiprocessor Communication Function

The multiprocessor communication function performs serial communication using the multiprocessor format, in which a multiprocessor bit is added to the transfer data, in asynchronous mode. Use of this function enables data transfer to be performed among a number of processors sharing transmission lines.

When multiprocessor communication is carried out, each receiving station is addressed by a unique ID code.

The serial communication cycle consists of two component cycles: an ID transmission cycle which specifies the receiving station, and a data transmission cycle. The multiprocessor bit is used to differentiate between the ID transmission cycle and the data transmission cycle.

The transmitting station first sends the ID of the receiving station with which it wants to perform serial communication as data with a 1 multiprocessor bit added. It then sends transmit data as data with a 0 multiprocessor bit added.

The receiving station skips the data until data with a 1 multiprocessor bit is sent.
When data with a 1 multiprocessor bit is received, the receiving station compares that data with its own ID. The station whose ID matches then receives the data sent next. Stations whose ID does not match continue to skip the data until data with a 1 multiprocessor bit is again received. In this way, data communication is carried out among a number of processors.

Figure 12.9 shows an example of inter-processor communication using the multiprocessor format.

## Data Transfer Format

There are four data transfer formats.
When the multiprocessor format is specified, the parity bit specification is invalid.
For details, see table 12.10.

## Clock

See the section on asynchronous mode.

Figure 12.9 Example of Inter-Processor Communication Using Multiprocessor Format (Transmission of Data H'AA to Receiving Station A)

## Data Transfer Operations

Multiprocessor serial data transmission: Figure 12.10 shows a sample flowchart for multiprocessor serial data transmission.

The following procedure should be used for multiprocessor serial data transmission.

[2] SCl status check and transmit data write:
Read SSR and check that the TDRE flag is set to 1 , then write transmit data to TDR. Set the MPBT bit in SSR to 0 or 1. Finally, clear the TDRE flag to 0 .
[3] Serial transmission continuation procedure:
To continue serial transmission, be sure to read 1 from the TDRE flag to confirm that writing is possible, then write data to TDR, and then clear the TDRE flag to 0 . Checking and clearing of the TDRE flag is automatic when the DTC* is activated by a transmit data empty interrupt (TXI) request, and data is written to TDR.
[4] Break output at the end of serial transmission:
To output a break in serial transmission, set the port DDR to 1 , clear DR to 0, then clear the TE bit in SCR to 0 .

Note: * The case, in which the DTC automatically clears the TDRE flag, occurs only when DISEL in DTC is 0 with the transfer counter not being 0 . Therefore, the TDRE flag should be cleared by CPU when DISEL is 1 , or when DISEL is 0 with the transfer counter being 0 .

Figure 12.10 Sample Multiprocessor Serial Transmission Flowchart

In serial transmission, the SCI operates as described below.
[1] The SCI monitors the TDRE flag in SSR, and if is 0 , recognizes that data has been written to TDR, and transfers the data from TDR to TSR.
[2] After transferring data from TDR to TSR, the SCI sets the TDRE flag to 1 and starts transmission.

If the TIE bit is set to 1 at this time, a transmit data empty interrupt (TXI) request is generated. The serial transmit data is sent from the TxD pin in the following order.
[a] Start bit:
One 0-bit is output.
[b] Transmit data:
8-bit or 7-bit data is output in LSB-first order.
[c] Multiprocessor bit
One multiprocessor bit (MPBT value) is output.
[d] Stop bit(s):
One or two 1-bits (stop bits) are output.
[e] Mark state:
1 is output continuously until the start bit that starts the next transmission is sent.
[3] The SCI checks the TDRE flag at the timing for sending the stop bit.
If the TDRE flag is cleared to 0 , data is transferred from TDR to TSR, the stop bit is sent, and then serial transmission of the next frame is started.
If the TDRE flag is set to 1 , the TEND flag in SSR is set to 1 , the stop bit is sent, and then the mark state is entered in which 1 is output continuously. If the TEIE bit in SCR is set to 1 at this time, a transmission end interrupt (TEI) request is generated.

Figure 12.11 shows an example of SCI operation for transmission using the multiprocessor format.

Figure $\mathbf{1 2 . 1 1}$ Example of SCI Operation in Transmission (Example with 8-Bit Data, Multiprocessor Bit, One Stop Bit)

Multiprocessor serial data reception: Figure 12.12 shows a sample flowchart for multiprocessor serial reception.

The following procedure should be used for multiprocessor serial data reception.

Figure 12.13 shows an example of SCI operation for multiprocessor format reception.

Figure 12.13 Example of SCI Operation in Reception (Example with 8-Bit Data, Multiprocessor Bit, One Stop Bit)

### 12.3.4 Operation in Clocked Synchronous Mode

In clocked synchronous mode, data is transmitted or received in synchronization with clock pulses, making it suitable for high-speed serial communication.

Inside the SCI, the transmitter and receiver are independent units, enabling full-duplex communication by use of a common clock. Both the transmitter and the receiver also have a double-buffered structure, so that data can be read or written during transmission or reception, enabling continuous data transfer.

Figure 12.14 shows the general format for clocked synchronous serial communication.

Figure 12.14 Data Format in Synchronous Communication
In clocked synchronous serial communication, data on the transmission line is output from one falling edge of the serial clock to the next. Data confirmation is guaranteed at the rising edge of the serial clock.

In clocked serial communication, one character consists of data output starting with the LSB and ending with the MSB. After the MSB is output, the transmission line holds the MSB state.

In clocked synchronous mode, the SCI receives data in synchronization with the rising edge of the serial clock.

## Data Transfer Format

A fixed 8-bit data format is used.

No parity or multiprocessor bits are added.

## Clock

Either an internal clock generated by the on-chip baud rate generator or an external serial clock input at the SCK pin can be selected, according to the setting of the C/A bit in SMR and the CKE1 and CKE0 bits in SCR. For details of SCI clock source selection, see table 12.9.

When the SCI is operated on an internal clock, the serial clock is output from the SCK pin.
Eight serial clock pulses are output in the transfer of one character, and when no transfer is performed the clock is fixed high. When only receive operations are performed, however, the serial clock is output until an overrun error occurs or the RE bit is cleared to 0 . If you want to perform receive operations in units of one character, you should select an external clock as the clock source.

## Data Transfer Operations

SCI initialization (clocked synchronous mode): Before transmitting and receiving data, you should first clear the TE and RE bits in SCR to 0 , then initialize the SCI as described below.

When the operating mode, transfer format, etc., is changed, the TE and RE bits must be cleared to 0 before making the change using the following procedure. When the TE bit is cleared to 0 , the TDRE flag is set to 1 and TSR is initialized. Note that clearing the RE bit to 0 does not change the contents of the RDRF, PER, FER, and ORER flags, or the contents of RDR.

Figure 12.15 shows a sample SCI initialization flowchart.

[1] Set the clock selection in SCR. Be sure to clear bits RIE, TIE, TEIE, and MPIE, TE and RE, to 0 .
[2] Set the data transfer format in SMR and SCMR.
[1] [3] Write a value corresponding to the bit rate to BRR. Not necessary if an external clock is used.
[2] [4] Wait at least one bit interval, then set the TE bit or RE bit in SCR to 1 . Also set the RIE, TIE, TEIE, and MPIE bits.
Setting the TE and RE bits enables the TxD and RxD pins to be used.

Note: In simultaneous transmit and receive operations, the TE and RE bits should both be cleared to 0 or set to 1 simultaneously.

Figure 12.15 Sample SCI Initialization Flowchart

Serial data transmission (clocked synchronous mode): Figure 12.16 shows a sample flowchart for serial transmission.

The following procedure should be used for serial data transmission.

Figure 12.16 Sample Serial Transmission Flowchart

In serial transmission, the SCI operates as described below.
[1] The SCI monitors the TDRE flag in SSR, and if is 0 , recognizes that data has been written to TDR, and transfers the data from TDR to TSR.
[2] After transferring data from TDR to TSR, the SCI sets the TDRE flag to 1 and starts transmission. If the TIE bit is set to 1 at this time, a transmit data empty interrupt (TXI) is generated.
When clock output mode has been set, the SCI outputs 8 serial clock pulses. When use of an external clock has been specified, data is output synchronized with the input clock.
The serial transmit data is sent from the TxD pin starting with the LSB (bit 0) and ending with the MSB (bit 7).
[3] The SCI checks the TDRE flag at the timing for sending the MSB (bit 7).
If the TDRE flag is cleared to 0 , data is transferred from TDR to TSR, and serial transmission of the next frame is started.
If the TDRE flag is set to 1 , the TEND flag in SSR is set to 1 , the MSB (bit 7) is sent, and the TxD pin maintains its state.
If the TEIE bit in SCR is set to 1 at this time, a TEI interrupt request is generated.
[4] After completion of serial transmission, the SCK pin is fixed.
Figure 12.17 shows an example of SCI operation in transmission.

Figure 12.17 Example of SCI Operation in Transmission
Serial data reception (clocked synchronous mode): Figure 12.18 shows a sample flowchart for serial reception.

The following procedure should be used for serial data reception.
When changing the operating mode from asynchronous to clocked synchronous, be sure to check that the ORER, PER, and FER flags are all cleared to 0 .

The RDRF flag will not be set if the FER or PER flag is set to 1 , and neither transmit nor receive operations will be possible.

[1] [1] $\begin{aligned} & \text { SCI initialization: } \\ & \text { The RxD pin is automatically } \\ & \text { designated as the receive data } \\ & \text { input pin. }\end{aligned}$
[1] [1] $\begin{aligned} & \text { SCI initialization: } \\ & \text { The RxD pin is automatically } \\ & \text { designated as the receive data } \\ & \text { input pin. }\end{aligned}$
[1] [1] $\begin{aligned} & \text { SCI initialization: } \\ & \text { The RxD pin is automatically } \\ & \text { designated as the receive data } \\ & \text { input pin. }\end{aligned}$
[1] [1] $\begin{aligned} & \text { SCI initialization: } \\ & \text { The RxD pin is automatically } \\ & \text { designated as the receive data } \\ & \text { input pin. }\end{aligned}$
[2] [3] Receive error processing: If a receive error occurs, read the ORER flag in SSR, and after performing the appropriate error processing, clear the ORER flag to 0 . Transfer cannot be resumed if the ORER flag is set to 1 .
[4] SCI status check and receive data read:
Read SSR and check that the RDRF flag is set to 1 , then read the receive data in RDR and clear the RDRF flag to 0 . Transition of the RDRF flag from 0 to 1 can also be identified by an RXI interrupt.
[5] Serial reception continuation procedure:
To continue serial reception, before the MSB (bit 7) of the current frame is received, finish reading the RDRF flag, reading RDR, and clearing the RDRF flag to 0 . The RDRF flag is cleared automatically when the DTC* is activated by a receive data full interrupt (RXI) request and the RDR value is read.
[3]

Note: * The case, in which the DTC automatically clears the RDRF flag, occurs only when DISEL in DTC is 0 with the transfer counter not being 0 . Therefore, the RDRF flag should be cleared by CPU when DISEL is 1 , or when DISEL is 0 with the when DISEL is 0 with the
transfer counter being 0 .

Figure 12.18 Sample Serial Reception Flowchart

In serial reception, the SCI operates as described below.
[1] The SCI performs internal initialization in synchronization with serial clock input or output.
[2] The received data is stored in RSR in LSB-to-MSB order.
After reception, the SCI checks whether the RDRF flag is 0 and the receive data can be transferred from RSR to RDR.
If this check is passed, the RDRF flag is set to 1 , and the receive data is stored in RDR. If a receive error is detected in the error check, the operation is as shown in table 12.11.
Neither transmit nor receive operations can be performed subsequently when a receive error has been found in the error check.
[3] If the RIE bit in SCR is set to 1 when the RDRF flag changes to 1 , a receive data full interrupt (RXI) request is generated.
Also, if the RIE bit in SCR is set to 1 when the ORER flag changes to 1 , a receive error interrupt (ERI) request is generated.

Figure 12.19 shows an example of SCI operation in reception.

Figure 12.19 Example of SCI Operation in Reception
Simultaneous serial data transmission and reception (clocked synchronous mode): Figure 12.20 shows a sample flowchart for simultaneous serial transmit and receive operations.

The following procedure should be used for simultaneous serial data transmit and receive operations.

Notes: When switching from transmit or receive operation to simultaneous transmit and receive operations, first clear the TE bit and RE bit to 0 , then set both these bits to 1 simultaneously.
[1] SCI initialization:
The TxD pin is designated as the transmit data output pin, and the $R \times D$ pin is designated as the receive data input pin, enabling simultaneous transmit and receive operations.
[2] SCl status check and transmit data write:
Read SSR and check that the TDRE flag is set to 1 , then write transmit data to TDR and clear the TDRE flag to 0 .
Transition of the TDRE flag from 0 to 1 can also be identified by a TXI interrupt.
[3] Receive error processing: If a receive error occurs, read the ORER flag in SSR, and after performing the appropriate error processing, clear the ORER flag to 0 . Transmission/reception cannot be resumed if the ORER flag is set to 1 .
[4] SCI status check and receive data read:
Read SSR and check that the RDRF flag is set to 1 , then read the receive data in RDR and clear the RDRF flag to 0 . Transition of the RDRF flag from 0 to 1 can also be identified by an RXI interrupt.
[5] Serial transmission/reception continuation procedure:
To continue serial transmission/ reception, before the MSB (bit 7) of the current frame is transmitted, read 1 from the TDRE flag to confirm that writing is possible. Then write data to TDR and clear the TDRE flag to 0 . Also, before the MSB (bit 7) of the current frame is received, finish reading the RDRF flag, reading RDR, and clearing the RDRF flag to 0.
Checking and clearing of the TDRE flag is automatic when the DTC is activated by a transmit data empty interrupt (TXI) request and data is written to TDR. Also, the RDRF flag is cleared automatically when the DTC* is activated by a receive data full interrupt (RXI) request and the RDR value is read.

* The case, in which the DTC automatically clears the TDRE flag or RDRF flag, occurs only when DISEL in the corresponding DTC transfer is 0 with the transfer counter not being 0 . Therefore, the corresponding flag should be cleared by CPU when DISEL in the corresponding DTC transfer is 1 , or when DISEL is 0 with the transfer counter being 0 .

Figure 12.20 Sample Flowchart of Simultaneous Serial Transmit and Receive Operations

### 12.4 SCI Interrupts

The SCI has four interrupt sources: the transmit-end interrupt (TEI) request, receive-error interrupt (ERI) request, receive-data-full interrupt (RXI) request, and transmit-data-empty interrupt (TXI) request. Table 12.12 shows the interrupt sources and their relative priorities. Individual interrupt sources can be enabled or disabled with the TIE, RIE, and TEIE bits in the SCR. Each kind of interrupt request is sent to the interrupt controller independently.

When the TDRE flag in SSR is set to 1 , a TXI interrupt request is generated. When the TEND flag in SSR is set to 1 , a TEI interrupt request is generated. A TXI interrupt can activate the DTC to perform data transfer. The TDRE flag is cleared to 0 automatically when data transfer is performed by the DTC*. The DTC cannot be activated by a TEI interrupt request.

When the RDRF flag in SSR is set to 1 , an RXI interrupt request is generated. When the ORER, PER, or FER flag in SSR is set to 1 , an ERI interrupt request is generated. An RXI interrupt can activate the DTC to perform data transfer. The RDRF flag is cleared to 0 automatically when data transfer is performed by the DTC*. The DTC cannot be activated by an ERI interrupt request.

Note: * The flag is not cleared when DISEL is 0 and the transfer counter value is not 0 .

Table 12.12 SCI Interrupt Sources

| Channel | Interrupt Source | Description | DTC <br> Activation | Priority* |
| :---: | :---: | :---: | :---: | :---: |
| 0 | ERI | Interrupt due to receive error (ORER, FER, or PER) | Not possible | High |
|  | RXI | Interrupt due to receive data full state (RDRF) | Possible |  |
|  | TXI | Interrupt due to transmit data empty state (TDRE) | Possible |  |
|  | TEI | Interrupt due to transmission end (TEND) | Not possible |  |
| 1 | ERI | Interrupt due to receive error (ORER, FER, or PER) | Not possible |  |
|  | RXI | Interrupt due to receive data full state (RDRF) | Possible |  |
|  | TXI | Interrupt due to transmit data empty state (TDRE) | Possible |  |
|  | TEI | Interrupt due to transmission end (TEND) | Not possible |  |
| 2 | ERI | Interrupt due to receive error (ORER, FER, or PER) | Not possible |  |
|  | RXI | Interrupt due to receive data full state (RDRF) | Possible |  |
|  | TXI | Interrupt due to transmit data empty state (TDRE) | Possible |  |
|  | TEI | Interrupt due to transmission end (TEND) | Not possible |  |

Note: * This table shows the initial state immediately after a reset. Relative priorities among channels can be changed by means of ICR.

A TEI interrupt is requested when the TEND flag is set to 1 while the TEIE bit is set to 1 . The TEND flag is cleared at the same time as the TDRE flag. Consequently, if a TEI interrupt and a TXI interrupt are requested simultaneously, the TXI interrupt may be accepted first, with the result that the TDRE and TEND flags are cleared. Note that the TEI interrupt will not be accepted in this case.

### 12.5 Usage Notes

The following points should be noted when using the SCI.

## Module Stop Mode Setting

SCI operation can be disabled or enabled using the module stop control register. The initial setting is for SCI operation to be halted. Register access is enabled by clearing module stop mode. For details, see section 18, Power-Down Modes.

## Relation between Writes to TDR and the TDRE Flag

The TDRE flag in SSR is a status flag that indicates that transmit data has been transferred from TDR to TSR. When the SCI transfers data from TDR to TSR, the TDRE flag is set to 1 .

Data can be written to TDR regardless of the state of the TDRE flag. However, if new data is written to TDR when the TDRE flag is cleared to 0 , the data stored in TDR will be lost since it has not yet been transferred to TSR. It is therefore essential to check that the TDRE flag is set to 1 before writing transmit data to TDR.

## Operation when Multiple Receive Errors Occur Simultaneously

If a number of receive errors occur at the same time, the state of the status flags in SSR is as shown in table 12.13. If there is an overrun error, data is not transferred from RSR to RDR, and the receive data is lost.

Table 12.13 State of SSR Status Flags and Transfer of Receive Data

| SSR Status Flags |  |  | Receive Data Transfer |  |  |
| :--- | :--- | :--- | :--- | :--- | :--- |
| RDRF | ORER | FER | PER | RSR to RDR | Receive Error Status |
| 1 | 1 | 0 | 0 | X | Overrun error |
| 0 | 0 | 1 | 0 | $O$ | Framing error |
| 0 | 0 | 0 | 1 | $O$ | Parity error |
| 1 | 1 | 1 | 0 | $X$ | Overrun error + framing error |
| 1 | 1 | 0 | 1 | $X$ | Overrun error + parity error |
| 0 | 0 | 1 | 1 | $O$ | Framing error + parity error |
| 1 | 1 | 1 | 1 | $X$ | Overrun error + framing error + <br> parity error |

## Legend:

O: Receive data is transferred from RSR to RDR.
$X$ : Receive data is not transferred from RSR to RDR.

## Break Detection and Processing (Asynchronous Mode Only)

When framing error (FER) detection is performed, a break can be detected by reading the RxD pin value directly. In a break, the input from the RxD pin becomes all 0 s, and so the FER flag is set, and the parity error flag (PER) may also be set.

Note that, since the SCI continues the receive operation after receiving a break, even if the FER flag is cleared to 0 , it will be set to 1 again.

## Sending a Break (Asynchronous Mode Only)

The TxD pin has a dual function as an I/O port whose direction (input or output) is determined by DR and DDR. This can be used to send a break.

Between serial transmission initialization and setting of the TE bit to 1 , the mark state is replaced by the value of $\operatorname{DR}$ (the pin does not function as the TxD pin until the TE bit is set to 1 ). Consequently, DDR and DR for the port corresponding to the TxD pin are first set to 1 .

To send a break during serial transmission, first clear DR to 0 , then clear the TE bit to 0 .
When the TE bit is cleared to 0 , the transmitter is initialized regardless of the current transmission state, the TxD pin becomes an I/O port, and 0 is output from the TxD pin.

## Receive Error Flags and Transmit Operations (Clocked Synchronous Mode Only)

Transmission cannot be started when a receive error flag (ORER, PER, or FER) is set to 1 , even if the TDRE flag is cleared to 0 . Be sure to clear the receive error flags to 0 before starting transmission.

Note also that receive error flags cannot be cleared to 0 even if the RE bit is cleared to 0 .

## Receive Data Sampling Timing and Reception Margin in Asynchronous Mode

In asynchronous mode, the SCI operates on a basic clock with a frequency of 16 times the transfer rate.

In reception, the SCI samples the falling edge of the start bit using the basic clock, and performs internal synchronization. Receive data is latched internally at the rising edge of the 8th pulse of the basic clock. This is illustrated in figure 12.21 .

Figure 12.21 Receive Data Sampling Timing in Asynchronous Mode
Thus the reception margin in asynchronous mode is given by formula (1) below.

$$
M=\left|\left(0.5-\frac{1}{2 N}\right)-(L-0.5) F-\frac{|D-0.5|}{N}(1+F)\right| \times 100 \%
$$

Where M: Reception margin (\%)
$\mathrm{N}:$ Ratio of bit rate to clock $(\mathrm{N}=16)$
D: Clock duty ( $\mathrm{D}=0$ to 1.0 )
L: Frame length ( $\mathrm{L}=9$ to 12 )
F: Absolute value of clock rate deviation
Assuming values of $\mathrm{F}=0$ and $\mathrm{D}=0.5$ in formula (1), a reception margin of $46.875 \%$ is given by formula (2) below.

When $\mathrm{D}=0.5$ and $\mathrm{F}=0$,

$$
\begin{align*}
M & =\left(0.5-\frac{1}{2 \times 16}\right) \times 100 \% \\
& =46.875 \% \tag{2}
\end{align*}
$$

However, this is only the computed value, and a margin of $20 \%$ to $30 \%$ should be allowed in system design.

## Restrictions Concerning DTC Updating

- When an external clock source is used as the serial clock, the transmit clock should not be input until at least $5 \phi$ clock cycles after TDR is updated by the CPU and DTC. Misoperation may occur if the transmit clock is input within $4 \phi$ clocks after TDR is updated. (Figure 12.22)
- When RDR is read by the DTC, be sure to set the activation source to the relevant SCI reception end interrupt (RXI).
- The flag is cleared only when DISEL in DTC is 0 with the transfer counter not being 0 . When DISEL is 1 ,or DISEL is 0 with the transfer counter being 0 , the flag should be cleared by CPU. Note that transmitting, in particular, may not successfully be executed unless the TDRE flag is cleared by CPU.

Figure 12.22 Example of Clocked Synchronous Transmission by DTC

## Operation in Case of Mode Transition

- Transmission

Operation should be stopped (by clearing TE, TIE, and TEIE to 0 ) before making a module stop mode or software standby mode transition. TSR, TDR, and SSR are reset. The output pin states in module stop mode or software standby mode depend on the port settings, and becomes high-level output after the relevant mode is cleared. If a transition is made during transmission, the data being transmitted will be undefined. When transmitting without changing the transmit mode after the relevant mode is cleared, transmission can be started by setting TE to 1 again, and performing the following sequence: SSR read $\rightarrow$ TDR write $\rightarrow$ TDRE clearance. To transmit with a different transmit mode after clearing the relevant mode, the procedure must be started again from initialization. Figure 12.23 shows a sample flowchart for mode transition during transmission. Port pin states are shown in figures 12.24 and 12.25. Operation should also be stopped (by clearing TE, TIE, and TEIE to 0 ) before making a transition from transmission by DTC transfer to module stop mode or software standby mode
transition. To perform transmission with the DTC after the relevant mode is cleared, setting TE and TIE to 1 will set the TXI flag and start DTC transmission.

Figure 12.23 Sample Flowchart for Mode Transition during Transmission

Figure 12.24 Asynchronous Transmission Using Internal Clock

Figure 12.25 Synchronous Transmission Using Internal Clock

- Reception

Receive operation should be stopped (by clearing RE to 0 ) before making a module stop mode or software standby mode transition. RSR, RDR, and SSR are reset. If a transition is made without stopping operation, the data being received will be invalid.
To continue receiving without changing the reception mode after the relevant mode is cleared, set RE to 1 before starting reception. To receive with a different receive mode, the procedure must be started again from initialization.
Figure 12.26 shows a sample flowchart for mode transition during reception.

Figure 12.26 Sample Flowchart for Mode Transition during Reception

## Switching from SCK Pin Function to Port Pin Function

- Problem in Operation

When switching the SCK pin function to the output port function (high-level output) by making the following settings while $\mathrm{DDR}=1, \mathrm{DR}=1, \mathrm{C} / \overline{\mathrm{A}}=1, \mathrm{CKE} 1=0, \mathrm{CKE} 0=0$, and TE $=1$ (synchronous mode), low-level output occurs for one half-cycle.

1. End of serial data transmission
2. TE bit $=0$
3. $\mathrm{C} / \overline{\mathrm{A}}$ bit $=0 \ldots$ Switchover to port output
4. Occurrence of low-level output

Figure 12.27 Operation when Switching from SCK Pin Function to Port Pin Function

- Sample Procedure for Avoiding Low-Level Output

As this sample procedure temporarily places the SCK pin in the input state, the SCK/port pin should be pulled up beforehand with an external circuit.
With $\mathrm{DDR}=1, \mathrm{DR}=1, \mathrm{C} / \overline{\mathrm{A}}=1, \mathrm{CKE} 1=0, \mathrm{CKE} 0=0$, and $\mathrm{TE}=1$, make the following settings in the order shown.

1. End of serial data transmission
2. TE bit $=0$
3. $\quad$ CKE1 bit $=1$
4. $\mathrm{C} / \overline{\mathrm{A}}$ bit $=0 \ldots$ Switchover to port output
5. $\quad$ CKE1 bit $=0$

Figure 12.28 Operation when Switching from SCK Pin Function to Port Pin Function (Example of Preventing Low-Level Output)

## Section 13 Smart Card Interface

### 13.1 Overview

SCI supports an IC card (Smart Card) interface conforming to ISO/IEC 7816-3 (Identification Card) as a serial communication interface extension function.

Switching between the normal serial communication interface and the Smart Card interface is carried out by means of a register setting.

### 13.1.1 Features

Features of the Smart Card interface supported by the H8S/2245 are as follows.

- Asynchronous mode
- Data length: 8 bits
- Parity bit generation and checking
- Transmission of error signal (parity error) in receive mode
- Error signal detection and automatic data retransmission in transmit mode
- Direct convention and inverse convention both supported
- On-chip baud rate generator allows any bit rate to be selected
- Three interrupt sources
- Three interrupt sources (transmit data empty, receive data full, and transmit/receive error) that can issue requests independently
- The transmit data empty interrupt and receive data full interrupt can activate the data transfer controller (DTC) to execute data transfer

### 13.1.2 Block Diagram

Figure 13.1 shows a block diagram of the Smart Card interface.

Figure 13.1 Block Diagram of Smart Card Interface

### 13.1.3 Pin Configuration

Table 13.1 shows the Smart Card interface pin configuration.
Table 13.1 Smart Card Interface Pins

| Channel | Pin Name | Symbol | I/O | Function |
| :--- | :--- | :--- | :--- | :--- |
| 0 | Serial clock pin 0 | SCK0 | I/O | SCl0 clock input/output |
|  | Receive data pin 0 | RxD0 | Input | SCl0 receive data input |
|  | Transmit data pin 0 | TxD0 | Output | SCl0 transmit data output |
| 1 | Serial clock pin 1 | SCK1 | I/O | SCl1 clock input/output |
|  | Receive data pin 1 | RxD1 | Input | SCl1 receive data input |
|  | Transmit data pin 1 | TxD1 | Output | SCl1 transmit data output |
| 2 | Serial clock pin 2 | SCK2 | I/O | SCl2 clock input/output |
|  | Receive data pin 2 | RxD2 | Input | SCl2 receive data input |
|  | Transmit data pin 2 | TxD2 | Output | SCl2 transmit data output |

### 13.1.4 Register Configuration

Table 13.2 shows the registers used by the Smart Card interface. Details of SMR, BRR, SCR, TDR, RDR, and MSTPCR are the same as for the normal SCI function: see the register descriptions in section 12, Serial Communication Interface (SCI).

## Table 13.2 Smart Card Interface Registers

| Channel | Name | Abbreviation | R/W | Initial Value | Address* ${ }^{1}$ |
| :---: | :---: | :---: | :---: | :---: | :---: |
| 0 | Serial mode register 0 | SMR0 | R/W | H'00 | H'FF78 |
|  | Bit rate register 0 | BRR0 | R/W | H'FF | H'FF79 |
|  | Serial control register 0 | SCR0 | R/W | $\mathrm{H}^{\prime} 00$ | H'FF7A |
|  | Transmit data register 0 | TDR0 | R/W | H'FF | H'FF7B |
|  | Serial status register 0 | SSR0 | $\mathrm{R} /(\mathrm{W}) *^{2}$ | H'84 | H'FF7C |
|  | Receive data register 0 | RDR0 | R | H'00 | H'FF7D |
|  | Smart card mode register 0 | SCMR0 | R/W | H'F2 | H'FF7E |
| 1 | Serial mode register 1 | SMR1 | R/W | H'00 | H'FF80 |
|  | Bit rate register 1 | BRR1 | R/W | H'FF | H'FF81 |
|  | Serial control register 1 | SCR1 | R/W | $\mathrm{H}^{\prime} \mathrm{OO}$ | H'FF82 |
|  | Transmit data register 1 | TDR1 | R/W | H'FF | H'FF83 |
|  | Serial status register 1 | SSR1 | $\mathrm{R} /(\mathrm{W})^{*}{ }^{2}$ | H'84 | H'FF84 |
|  | Receive data register 1 | RDR1 | R | H'00 | H'FF85 |
|  | Smart card mode register 1 | SCMR1 | R/W | H'F2 | H'FF86 |
| 2 | Serial mode register 2 | SMR2 | R/W | H'00 | H'FF88 |
|  | Bit rate register 2 | BRR2 | R/W | H'FF | H'FF89 |
|  | Serial control register 2 | SCR2 | R/W | H'00 | H'FF8A |
|  | Transmit data register 2 | TDR2 | R/W | H'FF | H'FF8B |
|  | Serial status register 2 | SSR2 | $\mathrm{R} /(\mathrm{W}) *^{2}$ | H'84 | H'FF8C |
|  | Receive data register 2 | RDR2 | R | H'00 | H'FF8D |
|  | Smart card mode register 2 | SCMR2 | R/W | H'F2 | H'FF8E |
| All | Module stop control register | MSTPCR | R/W | H'3FFF | H'FF3C |

Notes: 1. Lower 16 bits of the address.
2. Can only be written with 0 for flag clearing.

### 13.2 Register Descriptions

Registers added with the Smart Card interface and bits for which the function changes are described here.

### 13.2.1 Smart Card Mode Register (SCMR)

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | - | - | SDIR | SINV | - | SMIF |
| Initial value | 1 | 1 | 1 | 1 | 0 | 0 | 1 | 0 |
| R/W | - | - | - | - | R/W | R/W | - | R/W |

SCMR is an 8-bit readable/writable register that selects the Smart Card interface function.
SCMR is initialized to H'F2 by a reset, and in standby mode or module stop mode.
Bits 7 to 4-Reserved: Read-only bits, always read as 1.
Bit 3—Smart Card Data Transfer Direction (SDIR): Selects the serial/parallel conversion format.

Bit 3

| SDIR | Description |  |
| :--- | :--- | :--- |
| 0 | TDR contents are transmitted LSB-first | (Initial value) |
|  | Receive data is stored in RDR LSB-first |  |
| 1 | TDR contents are transmitted MSB-first |  |
|  | Receive data is stored in RDR MSB-first |  |

Bit 2—Smart Card Data Invert (SINV): Specifies inversion of the data logic level. This function is used together with the SDIR bit for communication with an inverse convention card. The SINV bit does not affect the logic level of the parity bit. For parity-related setting procedures, see section 13.3.4, Register Settings.

Bit 2

| SINV | Description | (Initial value) |
| :--- | :--- | :--- |
| 0 | TDR contents are transmitted as they are |  |
| 1 | Receive data is stored as it is in RDR |  |
|  | TDR contents are inverted before being transmitted |  |

Bit 1—Reserved: Read-only bit, always read as 1.
Bit 0—Smart Card Interface Mode Select (SMIF): Enables or disables the Smart Card interface function.

Bit 0
SMIF Description

| 0 | Smart Card interface function is disabled | (Initial value) |
| :--- | :--- | :--- |
| 1 | Smart Card interface function is enabled |  |

### 13.2.2 Serial Status Register (SSR)

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | TDRE | RDRF | ORER | ERS | PER | TEND | MPB | MPBT |
| Initial value : | 1 | 0 | 0 | 0 | 0 | 1 | 0 | 0 |
| R/W | $\mathrm{R} /(\mathrm{W})^{*}$ | $\mathrm{R} /(\mathrm{W})^{*}$ | $\mathrm{R} /(\mathrm{W}) *$ | $\mathrm{R} /(\mathrm{W})$ * | $\mathrm{R} /(\mathrm{W})^{*}$ | R | R | R/W |

Note: * Only 0 can be written to bits 7 to 3, to clear these flags.

Bit 4 of SSR has a different function in Smart Card interface mode. Coupled with this, the setting conditions for bit 2, TEND, are also different.

Bits 7 to 5-Operate in the same way as for the normal SCI. For details, see section 12.2.7, Serial Status Register (SSR).

Bit 4—Error Signal Status (ERS): In Smart Card interface mode, bit 4 indicates the status of the error signal sent back from the receiving end in transmission. Framing errors are not detected in Smart Card interface mode.

## Bit 4

## ERS Description

$0 \quad$ [Clearing conditions]

- Upon reset, and in standby mode or module stop mode
- When 0 is written to ERS after reading ERS = 1

1 [Setting condition]
When the low level of the error signal is sampled
Note: Clearing the TE bit in SCR to 0 does not affect the ERS flag, which retains its previous state.

Bits 3 to 0-Operate in the same way as for the normal SCI. For details, see section 12.2.7, Serial Status Register (SSR).

However, the setting conditions for the TEND bit, are as shown below.

## Bit 2

| TEND | Description |  |
| :--- | :--- | :--- |
| 0 | [Clearing conditions] | (Initial value) |

- When 0 is written to TDRE after reading TDRE $=1$
- When the DTC* is activated by a TXI interrupt and write data to TDR

1 [Setting conditions]

- Upon reset, and in standby mode or module stop mode
- When the TE bit in SCR is 0 and the ERS bit is also 0
- When TDRE $=1$ and ERS $=0$ (normal transmission) 12.5 etu after transmission of a 1-byte serial character when GM $=0$
- When TDRE $=1$ and ERS $=0$ (normal transmission) 11.0 etu after transmission of a 1 -byte serial character when $\mathrm{GM}=1$
Notes: etu: Elementary Time Unit (time for transfer of 1 bit)
* DTC can clear this bit only when DISEL is 0 with the transfer counter not being 0 .

### 13.2.3 Serial Mode Register (SMR)

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | GM | CHR | PE | O/E | STOP | MP | CKS1 | CKS0 |
| Initial value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| Set value* | GM | 0 | 1 | O/E | 1 | 0 | CKS1 | CKS0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

Note: * When the smart card interface is used, be sure to make the 0 or 1 setting shown for bits $6,5,3$, and 2.

The function of bit 7 of SMR changes in smart card interface mode.
Bit 7—GSM Mode (GM): Sets the smart card interface function to GSM mode.

This bit is cleared to 0 when the normal smart card interface is used. In GSM mode, this bit is set to 1 , the timing of setting of the TEND flag that indicates transmission completion is advanced and clock output control mode addition is performed. The contents of the clock output control mode addition are specified by bits 1 and 0 of the serial control register (SCR).

Bit 7

| GM | Description | (Initial value) |
| :--- | :--- | :--- |
| 0 | Normal smart card interface mode operation |  |
|  | $\bullet$ | TEND flag generation 12.5 etu after beginning of start bit |

Note: etu: Elementary time unit (time for transfer of 1 bit)

Bits 6 to $0-$ Operate in the same way as for the normal SCI.
For details, see section 12.2.5, Serial Mode Register (SMR).

### 13.2.4 Serial Control Register (SCR)

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | TIE | RIE | TE | RE | MPIE | TEIE | CKE1 | CKE0 |
| Initial value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

In smart card interface mode, the function of bits 1 and 0 of SCR changes when bit 7 of the serial mode register (SMR) is set to 1 .

Bits 7 to 2-Operate in the same way as for the normal SCI.
For details, see section 12.2.6, Serial Control Register (SCR).
Bits 1 and 0—Clock Enable 1 and 0 (CKE1, CKE0): These bits are used to select the SCI clock source and enable or disable clock output from the SCK pin.

In smart card interface mode, in addition to the normal switching between clock output enabling and disabling, the clock output can be specified as to be fixed high or low.

| SCMR | SMR | SCR Setting |  | SCK Pin Function |
| :---: | :---: | :---: | :---: | :---: |
| SMIF | $\overline{\mathrm{C} / \overline{\mathrm{A}}, \mathrm{GM}}$ | CKE1 | CKE0 |  |
| 0 | See the SCI |  |  |  |
| 1 | 0 | 0 | 0 | Operates as port I/O pin |
| 1 | 0 | 0 | 1 | Outputs clock as SCK output pin |
| 1 | 1 | 0 | 0 | Operates as SCK output pin, with output fixed low |
| 1 | 1 | 0 | 1 | Outputs clock as SCK output pin |
| 1 | 1 | 1 | 0 | Operates as SCK output pin, with output fixed high |
| 1 | 1 | 1 | 1 | Outputs clock as SCK output pin |

### 13.3 Operation

### 13.3.1 Overview

The main functions of the Smart Card interface are as follows.

- One frame consists of 8-bit data plus a parity bit.
- In transmission, a guard time of at least 2 etu (Elementary Time Unit: the time for transfer of one bit) is left between the end of the parity bit and the start of the next frame.
- If a parity error is detected during reception, a low error signal level is output for one etu period, 10.5 etu after the start bit.
- If the error signal is sampled during transmission, the same data is transmitted automatically after the elapse of 2 etu or longer.
- Only asynchronous communication is supported; there is no clocked synchronous communication function.

### 13.3.2 Pin Connections

Figure 13.2 shows a schematic diagram of Smart Card interface related pin connections.
In communication with an IC card, since both transmission and reception are carried out on a single data transmission line, the TxD pin and RxD pin should be connected with the LSI pin. The data transmission line should be pulled up to the $\mathrm{V}_{\mathrm{CC}}$ power supply with a resistor.

When the clock generated on the Smart Card interface is used by an IC card, the SCK pin output is input to the CLK pin of the IC card. No connection is needed if the IC card uses an internal clock.

LSI port output is used as the reset signal.
Other pins must normally be connected to the power supply or ground.

Figure 13.2 Schematic Diagram of Smart Card Interface Pin Connections
Note: If an IC card is not connected, and the TE and RE bits are both set to 1, closed transmission/reception is possible, enabling self-diagnosis to be carried out.

### 13.3.3 Data Format

Figure 13.3 shows the Smart Card interface data format. In reception in this mode, a parity check is carried out on each frame, and if an error is detected an error signal is sent back to the transmitting end, and retransmission of the data is requested. If an error signal is sampled during transmission, the same data is retransmitted.

When there is no parity error

When a parity error occurs

Legend:
Receiving station
Ds
: Start bit
D0 to D7 : Data bits
Dp : Parity bit
DE : Error signal
Figure 13.3 Smart Card Interface Data Format

The operation sequence is as follows.
[1] When the data line is not in use it is in the high-impedance state, and is fixed high with a pullup resistor.
[2] The transmitting station starts transfer of one frame of data. The data frame starts with a start bit (Ds, low-level), followed by 8 data bits (D0 to D7) and a parity bit (Dp).
[3] With the Smart Card interface, the data line then returns to the high-impedance state. The data line is pulled high with a pull-up resistor.
[4] The receiving station carries out a parity check.
If there is no parity error and the data is received normally, the receiving station waits for reception of the next data.
If a parity error occurs, however, the receiving station outputs an error signal ( DE, low-level) to request retransmission of the data. After outputting the error signal for the prescribed length of time, the receiving station places the signal line in the high-impedance state again. The signal line is pulled high again by a pull-up resistor.
[5] If the transmitting station does not receive an error signal, it proceeds to transmit the next data frame.

If it does receive an error signal, however, it returns to step [2] and retransmits the erroneous data.

### 13.3.4 Register Settings

Table 13.3 shows a bit map of the registers used by the smart card interface.
Bits indicated as 0 or 1 must be set to the value shown. The setting of other bits is described below.

Table 13.3 Smart Card Interface Register Settings
Bit

| Register | Bit $\mathbf{7}$ | Bit $\mathbf{6}$ | Bit $\mathbf{5}$ | Bit $\mathbf{4}$ | Bit 3 | Bit 2 | Bit 1 | Bit 0 |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| SMR | GM | 0 | 1 | O/E | 1 | 0 | CKS1 | CKS0 |
| BRR | BRR7 | BRR6 | BRR5 | BRR4 | BRR3 | BRR2 | BRR1 | BRR0 |
| SCR | TIE | RIE | TE | RE | 0 | 0 | CKE1* | CKE0 |
| TDR | TDR7 | TDR6 | TDR5 | TDR4 | TDR3 | TDR2 | TDR1 | TDR0 |
| SSR | TDRE | RDRF | ORER | ERS | PER | TEND | 0 | 0 |
| RDR | RDR7 | RDR6 | RDR5 | RDR4 | RDR3 | RDR2 | RDR1 | RDR0 |
| SCMR | - | - | - | - | SDIR | SINV | - | SMIF |

Legend:
— : Unused bit
Note: * The CKE1 bit must be cleared to 0 when the GM bit in SMR is cleared to 0 .

## SMR Setting

The GM bit is cleared to 0 in normal smart card interface mode, and set to 1 in GSM mode. The $\mathrm{O} / \overline{\mathrm{E}}$ bit is cleared to 0 if the IC card is of the direct convention type, and set to 1 if of the inverse convention type.

Bits CKS1 and CKS0 select the clock source of the on-chip baud rate generator. See section 13.3.5, Clock.

## BRR Setting

BRR is used to set the bit rate. See section 13.3.5, Clock, for the method of calculating the value to be set.

## SCR Setting

The function of the TIE, RIE, TE, and RE bits is the same as for the normal SCI. For details, see section 12, Serial Communication Interface (SCI).

Bits CKE1 and CKE0 specify the clock output. When the GM bit in SMR is cleared to 0 , set these bits to $\mathrm{B}^{\prime} 00$ if a clock is not to be output, or to B' 01 if a clock is to be output. When the GM bit in SMR is set to 1 , clock output is performed. The clock output can also be fixed high or low.

## Smart Card Mode Register (SCMR) Setting

The SDIR bit is cleared to 0 if the IC card is of the direct convention type, and set to 1 if of the inverse convention type.

The SINV bit is cleared to 0 if the IC card is of the direct convention type, and set to 1 if of the inverse convention type.

The SMIF bit is set to 1 in the case of the Smart Card interface.
Examples of register settings and the waveform of the start character are shown below for the two types of IC card (direct convention and inverse convention).

- Direct convention (SDIR $=\mathrm{SINV}=\mathrm{O} / \overline{\mathrm{E}}=0)$

With the direct convention type, the logic 1 level corresponds to state Z and the logic 0 level to state A, and transfer is performed in LSB-first order. The start character data above is H'3B.

The parity bit is 1 since even parity is stipulated for the Smart Card.

- Inverse convention $(\operatorname{SDIR}=\operatorname{SINV}=\mathrm{O} / \overline{\mathrm{E}}=1)$

With the inverse convention type, the logic 1 level corresponds to state A and the logic 0 level to state Z , and transfer is performed in MSB-first order. The start character data above is $\mathrm{H}^{\prime} 3 \mathrm{~F}$.

The parity bit is 0 , corresponding to state Z , since even parity is stipulated for the Smart Card.
With the H8S/2245 Group, inversion specified by the SINV bit applies only to the data bits, D7 to D0. For parity bit inversion, the $\mathrm{O} / \overline{\mathrm{E}}$ bit in SMR is set to odd parity mode (the same applies to both transmission and reception).

### 13.3.5 Clock

Only an internal clock generated by the on-chip baud rate generator can be used as the transmit/receive clock for the smart card interface. The bit rate is set with BRR and the CKS1 and CKS0 bits in SMR. The formula for calculating the bit rate is as shown below. Table 13.5 shows some sample bit rates.

If clock output is selected by setting CKE0 to 1 , a clock with a frequency of 372 times the bit rate is output from the SCK pin.

$$
\mathrm{B}=\frac{\phi}{1488 \times 2^{2 \mathrm{n}-1} \times(\mathrm{N}+1)} \times 10^{6}
$$

Where $\mathrm{N}=$ Value set in $\mathrm{BRR}(0 \leq \mathrm{N} \leq 255)$
$\mathrm{B}=\mathrm{Bit}$ rate (bit/s)
$\phi=$ Operating frequency $(\mathrm{MHz})$
$\mathrm{n}=$ See table 13.4
Table 13.4 Correspondence between $n$ and CKS1, CKS0

| $\mathbf{n}$ | CKS1 | CKS0 |
| :--- | :--- | :--- |
| 0 | 0 | $\frac{0}{1}$ |
| 1 | 1 | $\frac{0}{1}$ |
| 2 |  |  |
| 3 |  |  |

Table 13.5 Examples of Bit Rate B (bit/s) for Various BRR Settings (When $\mathbf{n}=\mathbf{0}$ )

|  | $\phi(\mathrm{MHz})$ |  |  |  |  |  |  |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| $\mathbf{N}$ | $\mathbf{1 0 . 0 0}$ | $\mathbf{1 0 . 7 1 4}$ | $\mathbf{1 3 . 0 0}$ | $\mathbf{1 4 . 2 8 5}$ | $\mathbf{1 6 . 0 0}$ | $\mathbf{1 8 . 0 0}$ | $\mathbf{2 0 . 0 0}$ |
| 0 | 13441 | 14400 | 17473 | 19200 | 21505 | 24194 | 26882 |
| 1 | 6720 | 7200 | 8737 | 9600 | 10753 | 12097 | 13441 |
| 2 | 4480 | 4800 | 5824 | 6400 | 7168 | 8065 | 8961 |

Note: Bit rates are rounded to the nearest whole number.

The method of calculating the value to be set in the bit rate register (BRR) from the operating frequency and bit rate, on the other hand, is shown below. N is an integer, $0 \leq \mathrm{N} \leq 255$, and the smaller error is specified.

$$
\mathrm{N}=\frac{\phi}{1488 \times 2^{2 \mathrm{n}-1} \times \mathrm{B}} \times 10^{6}-1
$$

Table 13.6 Examples of BRR Settings for Bit Rate B (bit/s) (When $\mathbf{n}=0)$

| bit/s | $\phi$ (MHz) |  |  |  |  |  |  |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | 7.1424 |  | 10.00 |  | 10.7136 |  | 13.00 |  | 14.2848 |  | 16.00 |  | 18.00 |  | 20.00 |  |
|  | N | Error | N | Error | N | Error | N | Error | N | Error | N | Error | N | Error | N | Error |
| 9600 | 0 | 0.00 | 1 | 30 | 1 | 25 | 1 | 8.99 | 1 | 0.00 | 1 | 12.01 | 2 | 15.99 | 2 | 6.60 |

Table 13.7 Maximum Bit Rate at Various Frequencies (Smart Card Interface Mode)

| $\boldsymbol{\phi}(\mathbf{M H z})$ | Maximum Bit Rate (bit/s) | $\mathbf{N}$ | $\mathbf{n}$ |
| :--- | :--- | :--- | :--- |
| 7.1424 | 9600 | 0 | 0 |
| 10.00 | 13441 | 0 | 0 |
| 10.7136 | 14400 | 0 | 0 |
| 13.00 | 17473 | 0 | 0 |
| 14.2848 | 19200 | 0 | 0 |
| 16.00 | 21505 | 0 | 0 |
| 18.00 | 24194 | 0 | 0 |
| 20.00 | 26882 | 0 | 0 |

The bit rate error is given by the following formula:

$$
\text { Error }(\%)=\left(\frac{\phi}{1488 \times 2^{2 n-1} \times B \times(N+1)} \times 10^{6}-1\right) \times 100
$$

### 13.3.6 Data Transfer Operations

## Initialization

Before transmitting and receiving data, initialize the SCI as described below. Initialization is also necessary when switching from transmit mode to receive mode, or vice versa.
[1] Clear the TE and RE bits in SCR to 0.
[2] Clear the error flags ERS, PER, and ORER in SSR to 0.
[3] Set the O/E bit and CKS1 and CKS0 bits in SMR. Clear the C/A, CHR, and MP bits to 0, and set the STOP and PE bits to 1 .
[4] Set the SMIF, SDIR, and SINV bits in SCMR.
When the SMIF bit is set to 1 , the TxD and RxD pins are both switched from ports to SCI pins, and are placed in the high-impedance state.
[5] Set the value corresponding to the bit rate in BRR.
[6] Set the CKE0 bit in SCR. Clear the TIE, RIE, TE, RE, MPIE, TEIE and CKE1 bits to 0 . If the CKE0 bit is set to 1 , the clock is output from the SCK pin.
[7] Wait at least one bit interval, then set the TIE, RIE, TE, and RE bits in SCR. Do not set the TE bit and RE bit at the same time, except for self-diagnosis.

## Serial Data Transmission

As data transmission in smart card mode involves error signal sampling and retransmission processing, the processing procedure is different from that for the normal SCI. Figure 13.4 shows a flowchart for transmitting, and figure 13.5 shows the relation between a transmit operation and the internal registers.
[1] Perform Smart Card interface mode initialization as described above in Initialization.
[2] Check that the ERS error flag in SSR is cleared to 0 .
[3] Repeat steps [2] and [3] until it can be confirmed that the TEND flag in SSR is set to 1.
[4] Write the transmit data to TDR, clear the TDRE flag to 0 , and perform the transmit operation. The TEND flag is cleared to 0 .
[5] When transmitting data continuously, go back to step [2].
[6] To end transmission, clear the TE bit to 0 .
With the above processing, interrupt servicing or data transfer by the DTC is possible.
If transmission ends and the TEND flag is set to 1 while the TIE bit is set to 1 and interrupt requests are enabled, a transmit data empty interrupt (TXI) request will be generated. If an error occurs in transmission and the ERS flag is set to 1 while the RIE bit is set to 1 and interrupt requests are enabled, a transfer error interrupt (ERI) request will be generated.

The timing for setting the TEND flag depends on the value of the GM bit in SMR. The TEND flag set timing is shown in figure 13.6.

If the DTC is activated by a TXI request, the number of bytes set in the DTC can be transmitted automatically, including automatic retransmission.

For details, see Interrupt Operations and Data Transfer Operation by DTC below.

Figure 13.4 Example of Transmission Processing Flow

Figure 13.5 Relation Between Transmit Operation and Internal Registers

Legend:
Ds : Start bit
D0 to D7 : Data bits
Dp : Parity bit
DE : Error signal
Figure 13.6 TEND Flag Generation Timing in Transmission Operation

## Serial Data Reception

Data reception in Smart Card mode uses the same processing procedure as for the normal SCI.
Figure 13.7 shows an example of the transmission processing flow.
[1] Perform Smart Card interface mode initialization as described above in Initialization.
[2] Check that the ORER flag and PER flag in SSR are cleared to 0 . If either is set, perform the appropriate receive error processing, then clear both the ORER and the PER flag to 0 .
[3] Repeat steps [2] and [3] until it can be confirmed that the RDRF flag is set to 1.
[4] Read the receive data from RDR.
[5] When receiving data continuously, clear the RDRF flag to 0 and go back to step [2].
[6] To end reception, clear the RE bit to 0 .

Figure 13.7 Example of Reception Processing Flow
With the above processing, interrupt servicing or data transfer by the or DTC is possible.

If reception ends and the RDRF flag is set to 1 while the RIE bit is set to 1 and interrupt requests are enabled, a receive data full interrupt (RXI) request will be generated. If an error occurs in reception and either the ORER flag or the PER flag is set to 1 , a transfer error interrupt (ERI) request will be generated.

If the DTC is activated by an RXI request, the receive data in which the error occurred is skipped, and only the number of bytes of receive data set in the DTC are transferred.

For details, see Interrupt Operation and Data Transfer Operation by DTC below.
If a parity error occurs during reception and the PER is set to 1 , the received data is still transferred to RDR, and therefore this data can be read.

## Mode Switching Operation

When switching from receive mode to transmit mode, first confirm that the receive operation has been completed, then start from initialization, clearing RE bit to 0 and setting TE bit to 1 . The RDRF flag or the PER and ORER flags can be used to check that the receive operation has been completed.

When switching from transmit mode to receive mode, first confirm that the transmit operation has been completed, then start from initialization, clearing TE bit to 0 and setting RE bit to 1 . The TEND flag can be used to check that the transmit operation has been completed.

## Fixing Clock Output Level

When the GM bit in SMR is set to 1, the clock output level can be fixed with bits CKE1 and CKE0 in SCR. At this time, the minimum clock pulse width can be made the specified width.

Figure 13.8 shows the timing for fixing the clock output level. In this example, GM is set to 1 , CKE1 is cleared to 0 , and the CKE0 bit is controlled.

Figure 13.8 Timing for Fixing Clock Output Level

## Interrupt Operation

There are three interrupt sources in smart card interface mode: transmit data empty interrupt (TXI) requests, transfer error interrupt (ERI) requests, and receive data full interrupt (RXI) requests. The transmit end interrupt (TEI) request is not used in this mode.

When the TEND flag in SSR is set to 1, a TXI interrupt request is generated.
When the RDRF flag in SSR is set to 1 , an RXI interrupt request is generated.
When any of flags ORER, PER, and ERS in SSR is set to 1 , an ERI interrupt request is generated. The relationship between the operating states and interrupt sources is shown in table 13.8.

Table 13.8 Smart Card Mode Operating States and Interrupt Sources

| Operating State | Flag | Enable Bit | Interrupt <br> Source | DTC <br> Activation |  |
| :--- | :--- | :--- | :--- | :--- | :--- |
| Transmit Mode | Normal <br> operation | TEND | TIE | TXI | Possible |
|  | Error | ERS | RIE | ERI | Not possible |
| Receive Mode | Normal <br> operation | RDRF | RIE | RXI | Possible |
|  | Error | PER, ORER | RIE | ERI | Not possible |

## Data Transfer Operation by DTC

In smart card mode, as with the normal SCI, transfer can be carried out using the DTC. In a transmit operation, the TDRE flag is also set to 1 at the same time as the TEND flag in SSR, and a TXI interrupt is generated. If the TXI request is designated beforehand as a DTC activation source, the DTC will be activated by the TXI request, and transfer of the transmit data will be carried out. When DISEL in DTC is 0 and the transfer counter value is not 0 , the TDRE and TEND flags are automatically cleared to 0 when data transfer is performed. If DISEL is 1 , or if DISEL is 0 and the transfer counter value is 0 , the DTC writes the transfer data to TDR but does not clear the flags. Therefore, the flags should be cleared by the CPU. In the event of an error, the SCI retransmits the same data automatically. The TEND flag remains cleared to 0 during this time, and the DTC is not activated. Thus, the number of bytes specified by the SCI and DTC are transmitted automatically even in retransmission following an error. However, the ERS flag is not cleared automatically when an error occurs, and so the RIE bit should be set to 1 beforehand so that an ERI request will be generated in the event of an error, and the ERS flag will be cleared.

When performing transfer using the DTC, it is essential to set and enable the DTC before carrying out SCI setting. For details of the DTC setting procedures, see section 7, Data Transfer Controller (DTC).

In a receive operation, an RXI interrupt request is generated when the RDRF flag in SSR is set to 1. If the RXI request is designated beforehand as a DTC activation source, the DTC will be activated by the RXI request, and transfer of the receive data will be carried out. At this time, the RDRF flag is cleared to 0 if DISEL in DTC is 0 and the transfer counter value is not 0 . If DISEL is 1 , or if DISEL is 0 and the transfer counter value is 0 , the DTC transfers the receive data but does not clear the flag. Therefore, the flag should be cleared by the CPU. If an error occurs, an error flag is set but the RDRF flag is not. Consequently, the DTC is not activated, but instead, an ERI interrupt request is sent to the CPU. Therefore, the error flag should be cleared.

### 13.3.7 Operation in GSM Mode

## Switching the Mode

When switching between smart card interface mode and software standby mode, the following switching procedure should be followed in order to maintain the clock duty.

- When changing from smart card interface mode to software standby mode
[1] Set the data register (DR) and data direction register (DDR) corresponding to the SCK pin to the value for the fixed output state in software standby mode.
[2] Write 0 to the TE bit and RE bit in the serial control register (SCR) to halt transmit/receive operation. At the same time, set the CKE1 bit to the value for the fixed output state in software standby mode.
[3] Write 0 to the CKE0 bit in SCR to halt the clock.
[4] Wait for one serial clock period.
During this interval, clock output is fixed at the specified level, with the duty preserved.
[5] Write H'00 to SMR and SCMR.
[6] Make the transition to the software standby state.
- When returning to smart card interface mode from software standby mode
[7] Exit the software standby state.
[8] Set the CKE1 bit in SCR to the value for the fixed output state (current SCK pin state) when software standby mode is initiated.
[9] Set smart card interface mode and output the clock. Signal generation is started with the normal duty.

Figure 13.9 Clock Halt and Restart Procedure

## Powering On

To secure the clock duty from power-on, the following switching procedure should be followed.
[1] The initial state is port input and high impedance. Use a pull-up resistor or pull-down resistor to fix the potential.
[2] Fix the SCK pin to the specified output level with the CKE1 bit in SCR.
[3] Set SMR and SCMR, and switch to smart card mode operation.
[4] Set the CKE0 bit in SCR to 1 to start clock output.

### 13.4 Usage Notes

The following points should be noted when using the SCI as a Smart Card interface.

## Receive Data Sampling Timing and Reception Margin in Smart Card Interface Mode

In Smart Card Interface mode, the SCI operates on a basic clock with a frequency of 372 times the transfer rate.

In reception, the SCI samples the falling edge of the start bit using the basic clock, and performs internal synchronization. Receive data is latched internally at the rising edge of the 186th pulse of the basic clock. This is illustrated in figure 13.10.

Figure 13.10 Receive Data Sampling Timing in Smart Card Mode
Thus the reception margin in asynchronous mode is given by the following formula.

$$
\mathrm{M}=\left|\left(0.5-\frac{1}{2 \mathrm{~N}}\right)-(\mathrm{L}-0.5) \mathrm{F}-\frac{|\mathrm{D}-0.5|}{\mathrm{N}}(1+\mathrm{F})\right| \times 100 \%
$$

Where M: Reception margin (\%)
N : Ratio of bit rate to clock $(\mathrm{N}=372)$
D: Clock duty ( $\mathrm{D}=0$ to 1.0 )
L: Frame length $(\mathrm{L}=10)$
F: Absolute value of clock frequency deviation
Assuming values of $\mathrm{F}=0$ and $\mathrm{D}=0.5$ in the above formula, the reception margin formula is as follows.

When $\mathrm{D}=0.5$ and $\mathrm{F}=0$,

$$
\begin{aligned}
\mathrm{M} & =(0.5-1 / 2 \times 372) \times 100 \% \\
& =49.866 \%
\end{aligned}
$$

## Retransfer Operations

Retransfer operations are performed by the SCI in receive mode and transmit mode as described below.

- Retransfer operation when SCI is in receive mode

Figure 13.11 illustrates the retransfer operation when the SCI is in receive mode.
[1] If an error is found when the received parity bit is checked, the PER bit in SSR is automatically set to 1 . If the RIE bit in SCR is enabled at this time, an ERI interrupt request is generated. The PER bit in SSR should be kept cleared to 0 until the next parity bit is sampled.
[2] The RDRF bit in SSR is not set for a frame in which an error has occurred.
[3] If no error is found when the received parity bit is checked, the PER bit in SSR is not set to 1 .
[4] If no error is found when the received parity bit is checked, the receive operation is judged to have been completed normally, and the RDRF flag in SSR is automatically set to 1 . If the RIE bit in SCR is enabled at this time, an RXI interrupt request is generated.
If DTC data transfer by an RXI source is enabled, the contents of RDR can be read automatically. When the RDR data is read by the DTC, the RDRF flag is automatically cleared to 0 if DISEL in DTC is 0 and the transfer counter value is not 0 .
[5] When a normal frame is received, the pin retains the high-impedance state at the timing for error signal transmission.

Figure 13.11 Retransfer Operation in SCI Receive Mode

- Retransfer operation when SCI is in transmit mode

Figure 13.12 illustrates the retransfer operation when the SCI is in transmit mode.
[6] If an error signal is sent back from the receiving end after transmission of one frame is completed, the ERS bit in SSR is set to 1 . If the RIE bit in SCR is enabled at this time, an ERI interrupt request is generated. The ERS bit in SSR should be kept cleared to 0 until the next parity bit is sampled.
[7] The TEND bit in SSR is not set for a frame for which an error signal indicating an abnormality is received.
[8] If an error signal is not sent back from the receiving end, the ERS bit in SSR is not set.
[9] If an error signal is not sent back from the receiving end, transmission of one frame, including a retransfer, is judged to have been completed, and the TEND bit in SSR is set to 1. If the TIE bit in SCR is enabled at this time, a TXI interrupt request is generated.

If data transfer by the DTC by means of the TXI source is enabled, the next data can be written to TDR automatically. When data is written to TDR by the DTC, the TDRE bit is automatically cleared to 0 if DISEL in DTC is 0 and the transfer counter value is not 0 .

Figure 13.12 Retransfer Operation in SCI Transmit Mode

## Section 14 A/D Converter

### 14.1 Overview

The H8/2245 Group incorporates a successive approximation type 10-bit A/D converter that allows up to four analog input channels to be selected.

### 14.1.1 Features

A/D converter features are listed below

- 10-bit resolution
- Four input channels
- Settable analog conversion voltage range
- Conversion of analog voltages with the reference voltage pin $\left(\mathrm{V}_{\text {ref }}\right)$ as the analog reference voltage
- High-speed conversion
- Minimum conversion time: $6.5 \mu$ s per channel (at $20-\mathrm{MHz}$ operation)
- Choice of single mode or scan mode
- Single mode: Single-channel A/D conversion
- Scan mode: Continuous A/D conversion on 1 to 4 channels
- Four data registers
- Conversion results are held in a 16-bit data register for each channel
- Sample and hold function
- Three kinds of conversion start
- Choice of software or timer conversion start trigger (TPU or 8-bit timer), or ADTRG pin
- $\mathrm{A} / \mathrm{D}$ conversion end interrupt generation
- A/D conversion end interrupt (ADI) request can be generated at the end of $A / D$ conversion
- Module stop mode can be set
- As the initial setting, A/D converter operation is halted. Register access is enabled by exiting module stop mode.

### 14.1.2 Block Diagram

Figure 14.1 shows a block diagram of the $\mathrm{A} / \mathrm{D}$ converter.

Figure 14.1 Block Diagram of A/D Converter

### 14.1.3 Pin Configuration

Table 14.1 summarizes the input pins used by the $A / D$ converter.
The $A V_{C C}$ and $A V_{S S}$ pins are the power supply pins for the analog block in the $A / D$ converter. The $\mathrm{V}_{\text {ref }}$ pin is the $A / D$ conversion reference voltage pin.

Table 14.1 A/D Converter Pins

| Pin Name | Symbol | $\mathbf{I / O}$ | Function |
| :--- | :--- | :--- | :--- |
| Analog power supply pin | $\mathrm{AV}_{\mathrm{cc}}$ | Input | Analog block power supply |
| Analog ground pin | $\mathrm{AV}_{\mathrm{ss}}$ | Input | Analog block ground and A/D conversion <br> reference voltage |
| Reference voltage pin | $\mathrm{V}_{\text {ref }}$ | Input | $\mathrm{A} / \mathrm{D}$ conversion reference voltage |
| Analog input pin 0 | $\mathrm{AN0}$ | Input | Analog input channel 0 |
| Analog input pin 1 | AN 1 | Input | Analog input channel 1 |
| Analog input pin 2 | AN 2 | Input | Analog input channel 2 |
| Analog input pin 3 | AN 3 | Input | Analog input channel 3 |
| A/D external trigger input pin | $\overline{\text { ADTRG }}$ | Input | External trigger input for starting A/D <br> conversion |

### 14.1.4 Register Configuration

Table 14.2 summarizes the registers of the $\mathrm{A} / \mathrm{D}$ converter.
Table 14.2 A/D Converter Registers

| Name | Abbreviation | R/W | Initial Value | Address** |
| :---: | :---: | :---: | :---: | :---: |
| A/D data register AH | ADDRAH | R | H'00 | H'FF90 |
| A/D data register AL | ADDRAL | R | H'00 | H'FF91 |
| A/D data register BH | ADDRBH | R | H'00 | H'FF92 |
| A/D data register BL | ADDRBL | R | H'00 | H'FF93 |
| A/D data register CH | ADDRCH | R | H'00 | H'FF94 |
| A/D data register CL | ADDRCL | R | H'00 | H'FF95 |
| A/D data register DH | ADDRDH | R | H'00 | H'FF96 |
| A/D data register DL | ADDRDL | R | H'00 | H'FF97 |
| A/D control/status register | ADCSR | $\mathrm{R} /(\mathrm{W}){ }^{*}{ }^{2}$ | H'00 | H'FF98 |
| A/D control register | ADCR | R/W | H'3F | H'FF99 |
| Module stop control register | MSTPCR | R/W | H'3FFF | H'FF3C |

Notes: 1. Lower 16 bits of the address.
2. Bit 7 can only be written with 0 for flag clearing.

### 14.2 Register Descriptions

### 14.2.1 A/D Data Registers A to D (ADDRA to ADDRD)

| Bit | 15 | 14 | 13 | 12 | 11 | 10 | 9 | 8 | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | AD9 | AD8 | AD7 | AD6 | AD5 | AD4 | AD3 | AD2 | AD1 | AD0 | - | - | - | - | - | - |
| Initial value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R | R |

There are four 16-bit read-only ADDR registers, ADDRA to ADDRD, used to store the results of A/D conversion.

The 10-bit data resulting from $\mathrm{A} / \mathrm{D}$ conversion is transferred to the ADDR register for the selected channel and stored there. The upper 8 bits of the converted data are transferred to the upper byte (bits 15 to 8 ) of ADDR, and the lower 2 bits are transferred to the lower byte (bits 7 and 6 ) and stored. Bits 5 to 0 are always read as 0 .

The correspondence between the analog input channels and ADDR registers is shown in table 14.3.

ADDR can always be read by the CPU. The upper byte can be read directly, but for the lower byte, data transfer is performed via a temporary register (TEMP). For details, see section 14.3, Interface to Bus Master.

The ADDR registers are initialized to $\mathrm{H}^{\prime} 0000$ by a reset, and in standby mode or module stop mode.

Table 14.3 Analog Input Channels and Corresponding ADDR Registers

| Analog Input Channel | A/D Data Register |
| :--- | :--- |
| AN0 | ADDRA |
| AN1 | ADDRB |
| AN2 | ADDRC |
| AN3 | ADDRD |

### 14.2.2 A/D Control/Status Register (ADCSR)

| Bit | $:$ | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | ADF | ADIE | ADST | SCAN | CKS | - | CH1 | CH0 |  |
|  | Initial value | $:$ | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | $:$ | R/(W)* | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

Note: * Only 0 can be written to bit 7, to clear this flag.

ADCSR is an 8-bit readable/writable register that controls $\mathrm{A} / \mathrm{D}$ conversion operations and shows the status of the operation.

ADCSR is initialized to $\mathrm{H}^{\prime} 00$ by a reset, and in hardware standby mode or module stop mode.
Bit 7—A/D End Flag (ADF): Status flag that indicates the end of A/D conversion.
Bit 7
ADF Description

0
[Clearing conditions]

- When 0 is written to the ADF flag after reading ADF = 1
- When the DTC* is activated by an ADI interrupt and ADDR is read

1 [Setting conditions]

- Single mode: When A/D conversion ends
- Scan mode: When A/D conversion ends on all specified channels

Note: * The flag is cleared only when DISEL in DTC is 0 and the transfer counter value is not 0 .

Bit 6-A/D Interrupt Enable (ADIE): Selects enabling or disabling of interrupt (ADI) requests at the end of $\mathrm{A} / \mathrm{D}$ conversion.

Bit 6

| ADIE | Description |  |
| :--- | :--- | :--- |
| 0 | A/D conversion end interrupt (ADI) request disabled | (Initial value) |
| 1 | A/D conversion end interrupt (ADI) request enabled |  |

Bit 5-A/D Start (ADST): Selects starting or stopping on A/D conversion. Holds a value of 1 during $\mathrm{A} / \mathrm{D}$ conversion.

The ADST bit can be set to 1 by software, a timer conversion start trigger, or the A/D external trigger input pin ( $\overline{\mathrm{ADTRG}}$ ).

## Bit 5

| ADST | Description |  |
| :--- | :--- | :--- |
| 0 | - | A/D conversion stopped |

Bit 4-Scan Mode (SCAN): Selects single mode or scan mode as the A/D conversion operating mode. See section 14.4, Operation, for single mode and scan mode operation. Only set the SCAN bit while conversion is stopped ( $\operatorname{ADST}=0$ ).

| Bit $\mathbf{4}$ |  |  |
| :--- | :--- | :--- |
| SCAN | Description |  |
| 0 | Single mode | (Initial value) |
| 1 | Scan mode |  |

Bit 3-Clock Select (CKS): Sets the A/D conversion time. Only change the conversion time while conversion is stopped ( $\mathrm{ADST}=0$ ).

Set the conversion time to a value equal to or greater than the conversion time indicated in section 19.5, A/D Conversion Characteristics.

## Bit 3

CKS Description

| 0 | Conversion time $=266$ states (max.) | (Initial value) |
| :--- | :--- | :---: |
| 1 | Conversion time $=134$ states $($ max. $)$ |  |

Bit 2—Reserved: This bit can be read or written, but should only be written with 0 .

Bits 1 and $\mathbf{0}$ —Channel Select 1 and $\mathbf{0}$ (CH1, CH0): Together with the SCAN bit, these bits select the analog input channel(s).

Only set the input channel while conversion is stopped.

| Bit $\mathbf{1}$ | Bit 0 |  | Description |  |
| :--- | :--- | :--- | :--- | :--- |
| CH1 | CH0 |  | Single Mode (SCAN = 0) | Scan Mode (SCAN = 1) |
| 0 | 0 | AN0 | (Initial value) | AN0 |
|  | 1 | AN1 | AN0, AN1 |  |
| 1 | 0 | AN2 | AN0 to AN2 |  |
|  | 1 | AN3 | AN0 to AN3 |  |

### 14.2.3 A/D Control Register (ADCR)

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | TRGS1 | TRGS0 | - | - | - | - | - | - |
| Initial value | 0 | 0 | 1 | 1 | 1 | 1 | 1 | 1 |
| R/W | R/W | R/W | - | - | - | - | - | - |

ADCR is an 8-bit readable/writable register that enables or disables external triggering of A/D conversion operations.

ADCR is initialized to $\mathrm{H}^{\prime} 3 \mathrm{~F}$ by a reset, and in hardware standby mode or module stop mode.
Bits 7 and 6-Timer Trigger Select 1 and 0 (TRGS1, TRGS0): Select enabling or disabling of the start of A/D conversion by a trigger signal. Only set bits TRGS1 and TRGS0 while conversion is stopped.

| Bit $\mathbf{7}$ | Bit $\mathbf{6}$ |  |
| :--- | :--- | :--- |
| TRGS1 | TRGS0 | Description |
| 0 | 0 | Start of A/D conversion by external trigger is disabled |
|  | 1 | Start of A/D conversion by external trigger (TPU) is enabled |
| 1 | 0 | Start of A/D conversion by external trigger (8-bit timer) is enabled |
|  | 1 | Start of A/D conversion by external trigger pin is enabled |

Bits 5 to 0—Reserved: These bits are reserved; they are always read as 1 and cannot be modified.

### 14.2.4 Module Stop Control Register (MSTPCR)

R/W : R/W R/W R/W R/W R/W R/W R/W R/W R/W R/W R/W R/W R/W R/W R/W R/W

MSTPCR is a 16-bit readable/writable register that performs module stop mode control.
When the MSTP9 bit in MSTPCR is set to $1, \mathrm{~A} / \mathrm{D}$ converter operation stops at the end of the bus cycle and a transition is made to module stop mode. Registers cannot be read or written to in module stop mode. For details, see section 18.5, Module Stop Mode.

MSTPCR is initialized to H'3FFF by a reset and in hardware standby mode. It is not initialized in software standby mode.

Bit 9—Module Stop (MSTP9): Specifies the A/D converter module stop mode.
Bit 9
MSTP9 Description

| 0 | A/D converter module stop mode cleared |  |
| :--- | :--- | :--- |
| 1 | A/D converter module stop mode set | (Initial value) |

### 14.3 Interface to Bus Master

ADDRA to ADDRD are 16 -bit registers, and the data bus to the bus master is 8 bits wide. Therefore, in accesses by the bus master, the upper byte is accessed directly, but the lower byte is accessed via a temporary register (TEMP).

A data read from ADDR is performed as follows. When the upper byte is read, the upper byte value is transferred to the CPU and the lower byte value is transferred to TEMP. Next, when the lower byte is read, the TEMP contents are transferred to the CPU.

When reading ADDR. always read the upper byte before the lower byte. It is possible to read only the upper byte, but if only the lower byte is read, incorrect data may be obtained.

Figure 14.2 shows the data flow for ADDR access.

Figure 14.2 ADDR Access Operation (Reading H'AA40)

### 14.4 Operation

The A/D converter operates by successive approximation with 10-bit resolution. It has two operating modes: single mode and scan mode.

### 14.4.1 Single Mode $(S C A N=0)$

Single mode is selected when A/D conversion is to be performed on a single channel only. A/D conversion is started when the ADST bit is set to 1, according to the software or external trigger input. The ADST bit remains set to 1 during A/D conversion, and is automatically cleared to 0 when conversion ends.

On completion of conversion, the ADF flag is set to 1 . If the ADIE bit is set to 1 at this time, an ADI interrupt request is generated. The ADF flag is cleared by writing 0 after reading ADCSR.

When the operating mode or analog input channel must be changed during analog conversion, to prevent incorrect operation, first clear the ADST bit to 0 in ADCSR to halt A/D conversion. After making the necessary changes, set the ADST bit to 1 to start A/D conversion again. The ADST bit can be set at the same time as the operating mode or input channel is changed.

Typical operations when channel 1 (AN1) is selected in single mode are described next. Figure 14.3 shows a timing diagram for this example.
[1] Single mode is selected $(\mathrm{SCAN}=0)$, input channel AN1 is selected $(\mathrm{CH} 1=0, \mathrm{CH} 0=1)$, the $\mathrm{A} / \mathrm{D}$ interrupt is enabled ( $\mathrm{ADIE}=1$ ), and $\mathrm{A} / \mathrm{D}$ conversion is started $(\mathrm{ADST}=1)$.
[2] When $\mathrm{A} / \mathrm{D}$ conversion is completed, the result is transferred to ADDRB. At the same time the ADF flag is set to 1 , the ADST bit is cleared to 0 , and the A/D converter becomes idle.
[3] Since $\mathrm{ADF}=1$ and $\mathrm{ADIE}=1$, an ADI interrupt is requested.
[4] The A/D interrupt handling routine starts.
[5] The routine reads ADCSR, then writes 0 to the ADF flag.
[6] The routine reads and processes the connection result (ADDRB).
[7] Execution of the A/D interrupt handling routine ends. After that, if the ADST bit is set to 1 , A/D conversion starts again and steps [2] to [7] are repeated.

Figure 14.3 Example of A/D Converter Operation (Single Mode, Channel 1 Selected)

### 14.4.2 $\quad$ Scan Mode $(S C A N=1)$

Scan mode is useful for monitoring analog inputs in a group of one or more channels. When the ADST bit is set to 1 by a software, timer or external trigger input, A/D conversion starts on the first channel in the group (ANO). When two or more channels are selected, after conversion of the first channel ends, conversion of the second channel (AN1) starts immediately. A/D conversion continues cyclically on the selected channels until the ADST bit is cleared to 0 . The conversion results are transferred for storage into the ADDR registers corresponding to the channels.

When the operating mode or analog input channel must be changed during analog conversion, to prevent incorrect operation, first clear the ADST bit to 0 in ADCSR to halt A/D conversion. After making the necessary changes, set the ADST bit to 1 to start A/D conversion again. The ADST bit can be set at the same time as the operating mode or input channel is changed.

Typical operations when three channels (AN0 to AN2) are selected in scan mode are described next. Figure 14.4 shows a timing diagram for this example.
[1] Scan mode is selected ( $\mathrm{SCAN}=1$ ), analog input channels AN0 to AN2 are selected ( $\mathrm{CH} 1=1$, $\mathrm{CH} 0=0)$, and $\mathrm{A} / \mathrm{D}$ conversion is started $(\mathrm{ADST}=1)$
[2] When $\mathrm{A} / \mathrm{D}$ conversion of the first channel (ANO) is completed, the result is transferred to ADDRA. Next, conversion of the second channel (AN1) starts automatically.
[3] Conversion proceeds in the same way through the third channel (AN2).
[4] When conversion of all the selected channels (AN0 to AN2) is completed, the ADF flag is set to 1 and conversion of the first channel (AN0) starts again. If the ADIE bit is set to 1 at this time, an ADI interrupt is requested after $\mathrm{A} / \mathrm{D}$ conversion ends.
[5] Steps [2] to [4] are repeated as long as the ADST bit remains set to 1 . When the ADST bit is cleared to $0, \mathrm{~A} / \mathrm{D}$ conversion stops. After that, if the ADST bit is set to $1, \mathrm{~A} / \mathrm{D}$ conversion starts again from the first channel (ANO).

Section 14 A/D Converter

Figure 14.4 Example of A/D Converter Operation (Scan Mode, Channels AN0 to AN2 Selected)

### 14.4.3 Input Sampling and A/D Conversion Time

The A/D converter has a built-in sample-and-hold circuit. The A/D converter samples the analog input at a time $t_{D}$ after the ADST bit is set to 1 , then starts conversion. Figure 14.5 shows the A/D conversion timing. Table 14.4 indicates the $\mathrm{A} / \mathrm{D}$ conversion time.

As indicated in figure 14.5, the A/D conversion time includes $\mathrm{t}_{\mathrm{D}}$ and the input sampling time. The length of $t_{D}$ varies depending on the timing of the write access to ADCSR. The total conversion time therefore varies within the ranges indicated in table 14.4.

In scan mode, the values given in table 14.4 apply to the first conversion time. In the second and subsequent conversions the conversion time is fixed at 256 states when CKS $=0$ or 128 states when $\mathrm{CKS}=1$.

Legend:
(1) : ADCSR write cycle
(2) : ADCSR address
$t_{D}$ : A/D conversion start delay
$t_{\text {SPL }}$ : Input sampling time
tconv: A/D conversion time
Figure 14.5 A/D Conversion Timing

Table 14.4 A/D Conversion Time (Single Mode)

| Item | Symbol | CKS $=0$ |  |  | CKS $=1$ |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | Min | Typ | Max | Min | Typ | Max |
| A/D conversion start delay | $\mathrm{t}_{\text {b }}$ | 10 | - | 17 | 6 | - | 9 |
| Input sampling time | $\mathrm{t}_{\text {SPL }}$ | - | 63 | - | - | 31 | - |
| A/D conversion time | $\mathrm{t}_{\text {conv }}$ | 259 | - | 266 | 131 | - | 134 |

Note: Values in the table are the number of states.

### 14.4.4 External Trigger Input Timing

A/D conversion can be externally triggered. When the TRGS1 and TRGS0 bits are set to 11 in ADCR, external trigger input is enabled at the $\overline{\text { ADTRG }}$ pin. A falling edge at the $\overline{\text { ADTRG }}$ pin sets the ADST bit to 1 in ADCSR, starting A/D conversion. Other operations, in both single and scan modes, are the same as if the ADST bit has been set to 1 by software. Figure 14.6 shows the timing.

Figure 14.6 External Trigger Input Timing

### 14.5 Interrupts

The A/D converter generates an interrupt (ADI) at the end of $\mathrm{A} / \mathrm{D}$ conversion. The ADI interrupt request can be enabled or disabled by the ADIE bit in ADCSR.

The DTC can be activated by an ADI interrupt. Having the converted data read by the DTC in response to an ADI interrupt enables continuous conversion to be achieved without imposing a load on software.

The A/D converter interrupt source is shown in table 14.5.

## Table 14.5 A/D Converter Interrupt Source

| Interrupt Source | Description | DTC Activation |
| :--- | :--- | :--- |
| ADI | Interrupt due to end of conversion | Possible |

### 14.6 Usage Notes

The following points should be noted when using the A/D converter.

## Module Stop Mode Setting

Operation of the $\mathrm{A} / \mathrm{D}$ converter can be disabled or enabled using the module stop control register. The initial setting is for operation of the A/D converter to be halted. Register access is enabled by clearing module stop mode. For details, see section 18, Power-Down Modes.

## Setting Range of Analog Power Supply and Other Pins

(1) Analog input voltage range

The voltage applied to analog input pins AN0 to AN3 during A/D conversion should be in the range $\mathrm{AV}_{\mathrm{SS}} \leq \mathrm{ANn} \leq \mathrm{AV}_{\text {ref }}$.
(2) Relation between $A V_{c \mathrm{C}}, \mathrm{AV}_{\mathrm{ss}}$ and $\mathrm{V}_{\mathrm{CC}}, \mathrm{V}_{\mathrm{ss}}$

As the relationship between $A V_{c C}, A V_{S S}$ and $V_{C C}, V_{S S}$, set $A V_{S S}=V_{S S}$. If the $A / D$ converter is not used, the $A V_{\text {cc }}$ and $A V_{\text {ss }}$ pins must on no account be left open.
(3) $V_{\text {ref }}$ input range

The analog reference voltage input at the $V_{\text {ref }}$ pin set in the range $V_{\text {ref }} \leq A V_{c c}$.
Note: If conditions (1), (2), and (3) above are not met, the reliability of the device may be adversely affected.

## Notes on Board Design

In board design, digital circuitry and analog circuitry should be as mutually isolated as possible, and layout in which digital circuit signal lines and analog circuit signal lines cross or are in close proximity should be avoided as far as possible. Failure to do so may result in incorrect operation of the analog circuitry due to inductance, adversely affecting A/D conversion values.

Also, digital circuitry must be isolated from the analog input signals (AN0 to AN3), analog reference power supply $\left(\mathrm{V}_{\text {ref }}\right)$, and analog power supply $\left(\mathrm{AV}_{\mathrm{CC}}\right)$ by the analog ground $\left(\mathrm{AV}_{\mathrm{SS}}\right)$. Also, the analog ground $\left(\mathrm{AV}_{\mathrm{sS}}\right)$ should be connected at one point to a stable digital ground $\left(\mathrm{V}_{\mathrm{ss}}\right)$ on the board.

## Notes on Noise Countermeasures

A protection circuit connected to prevent damage due to an abnormal voltage such as an excessive surge at the analog input pins (AN0 to AN3) and analog reference power supply $\left(\mathrm{V}_{\text {ref }}\right)$ should be connected between $A V_{C C}$ and $A V_{\text {SS }}$ as shown in figure 14.7.

Also, the bypass capacitors connected to $\mathrm{AV}_{\mathrm{CC}}$ and $\mathrm{V}_{\text {ref }}$ and the filter capacitor connected to AN0 to AN 3 must be connected to $\mathrm{AV}_{\mathrm{ss}}$.

If a filter capacitor is connected as shown in figure 14.7, the input currents at the analog input pins (AN0 to AN3) are averaged, and so an error may arise. Also, when A/D conversion is performed frequently, as in scan mode, if the current charged and discharged by the capacitance of the sample-and-hold circuit in the A/D converter exceeds the current input via the input impedance $\left(\mathrm{R}_{\mathrm{in}}\right)$, an error will arise in the analog input pin voltage. Careful consideration is therefore required when deciding the circuit constants.

Figure 14.7 Example of Analog Input Protection Circuit
Table 14.6 Analog Pin Specifications

| Item | Min | Max | Unit |
| :--- | :--- | :--- | :--- |
| Analog input capacitance | - | 20 | pF |
| Permissible signal source impedance | - | $10^{*}$ | $\mathrm{k} \Omega$ |

Note: * When $\mathrm{V}_{\mathrm{cc}}=4.0 \mathrm{~V}$ to 5.5 V and $\phi \leq 12 \mathrm{MHz}$

Note: Values are reference values.
Figure 14.8 Analog Input Pin Equivalent Circuit

## A/D Conversion Precision Definitions

H8S/2245 Group A/D conversion precision definitions are given below.

- Resolution

The number of $\mathrm{A} / \mathrm{D}$ converter digital output codes

- Offset error

The deviation of the analog input voltage value from the ideal $\mathrm{A} / \mathrm{D}$ conversion characteristic when the digital output changes from the minimum voltage value $\mathrm{B}^{\prime} 0000000000\left(\mathrm{H}^{\prime} 000\right)$ to $\mathrm{B}^{\prime} 0000000001$ ( $\mathrm{H}^{\prime} 001$ ) (see figure 14.10).

- Full-scale error

The deviation of the analog input voltage value from the ideal $\mathrm{A} / \mathrm{D}$ conversion characteristic when the digital output changes from B'1111111110 (H'3FE) to B'11111111111 (H'3FF) (see figure 14.10).

- Quantization error

The deviation inherent in the A/D converter, given by $1 / 2$ LSB (see figure 14.9).

- Nonlinearity error

The error with respect to the ideal A/D conversion characteristic between the zero voltage and the full-scale voltage. Does not include the offset error, full-scale error, or quantization error.

- Absolute precision

The deviation between the digital value and the analog input value. Includes the offset error, full-scale error, quantization error, and nonlinearity error.

Figure 14.9 A/D Conversion Precision Definitions (1)

Figure 14.10 A/D Conversion Precision Definitions (2)

## Permissible Signal Source Impedance

$\mathrm{H} 8 \mathrm{~S} / 2245$ Group analog input is designed so that conversion precision is guaranteed for an input signal for which the signal source impedance is $10 \mathrm{k} \Omega$ or less. This specification is provided to enable the A/D converter's sample-and-hold circuit input capacitance to be charged within the sampling time; if the sensor output impedance exceeds $10 \mathrm{k} \Omega$, charging may be insufficient and it may not be possible to guarantee the A/D conversion precision.

However, if a large capacitance is provided externally, the input load will essentially comprise only the internal input resistance of $10 \mathrm{k} \Omega$, and the signal source impedance is ignored.

However, since a low-pass filter effect is obtained in this case, it may not be possible to follow an analog signal with a large differential coefficient (e.g., $5 \mathrm{mV} / \mu \mathrm{sec}$ or greater).

When converting a high-speed analog signal, a low-impedance buffer should be inserted.

## Influences on Absolute Precision

Adding capacitance results in coupling with GND, and therefore noise in GND may adversely affect absolute precision. Be sure to make the connection to an electrically stable GND such as $\mathrm{AV}_{\text {ss }}$.

Care is also required to insure that filter circuits do not communicate with digital signals on the mounting board, so acting as antennas.

Figure 14.11 Example of Analog Input Circuit

## Section 15 RAM

### 15.1 Overview

The H8S/2246, H8S/2244, and H8S/2242 have 8 kbytes of on-chip high-speed static RAM, and the H8S/2245, H8S/2243, H8S/2241, and H8S/2240 have 4 kbytes. The on-chip RAM is connected to the CPU by a 16-bit data bus, enabling both byte data and word data to be accessed in one state. This makes it possible to perform fast word data transfer.

The on-chip RAM on the H8S/2246, H8S/2244, and H8S/2242 is located in addresses H'E400 to H'FBFF ( 6 kbytes) in normal mode (modes 1 to 3 ), and in addresses H'FFDC00 to H'FFFBFF (8 kbytes) in advanced mode (modes 4 to 7 ).

The on-chip RAM on the H8S/2245, H8S/2243, H8S/2241, and H8S/2240 is located in addresses H'EC00 to H'FBFF (4 kbytes) in normal mode (modes 1 to 3), and in addresses H'FFEC00 to H'FFFBFF (4 kbytes) in advanced mode (modes 4 to 7 ).

The on-chip RAM can be enabled or disabled by means of the RAM enable bit (RAME) in the system control register (SYSCR).

### 15.1.1 Block Diagram

Figure 15.1 shows a block diagram of the on-chip RAM.

Figure 15.1 Block Diagram of RAM (Example with H8S/2246 in Advanced Mode)

### 15.1.2 Register Configuration

The on-chip RAM is controlled by SYSCR. Table 15.1 shows the register configuration.
Table 15.1 Register Configuration

| Name | Abbreviation | R/W | Initial Value | Address* |
| :--- | :--- | :--- | :--- | :--- |
| System control register | SYSCR | R/W | H'01 | H'FF39 |

Note: * Lower 16 bits of the address.

### 15.2 Register Descriptions

### 15.2.1 System Control Register (SYSCR)

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | INTM1 | INTM0 | NMIEG | - | - | RAME |
| Initial value : | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 |
| R/W | R/W | - | R/W | R/W | R/W | - | - | R/W |

The on-chip RAM is enabled or disabled by the RAME bit in SYSCR. For details of other bits in SYSCR, see section 3.2.2, System Control Register (SYSCR).

Bit 0—RAM Enable (RAME): Enables or disables the on-chip RAM. The RAME bit is initialized when the reset state is released. It is not initialized in software standby mode.

Bit 0

| RAME | Description |  |
| :--- | :--- | :--- |
| 0 | On-chip RAM is disabled | (Initial value) |
| 1 | On-chip RAM is enabled |  |

Note: Do not clear the RAME bit to 0 when the DTC is used.

### 15.3 Operation

When the RAME bit is set to 1 , accesses to $\mathrm{H} 8 \mathrm{~S} / 2246, \mathrm{H} 8 \mathrm{~S} / 2244$, and $\mathrm{H} 8 \mathrm{~S} / 2242$ addresses H'FFDC00 to H'FFFBFF, and H8S/2245, H8S/2243, H8S/2241, and H8S/2240 addresses H'FFEC00 to H'FFFBFF, are directed to the on-chip RAM. When the RAME bit is cleared to 0 , the off-chip address space is accessed.

Since the on-chip RAM is connected to the CPU by an internal 16-bit data bus, it can be written to and read in byte or word units. Each type of access can be performed in one state.

Even addresses use the upper 8 bits, and odd addresses use the lower 8 bits. Word data must start at an even address.

## Section 16 ROM

### 16.1 Overview

The H8S/2246 and H8S/2245 have 128 kbytes of on-chip ROM (PROM or mask ROM). The H8S/2244 and H8S/2243 have 64 kbytes of on-chip ROM (mask ROM). The H8S/2242 and H8S/2241 have 32 kbytes of on-chip ROM (mask ROM). The ROM is connected to the CPU by a 16 -bit data bus. The CPU accesses both byte data and word data in one state, making possible rapid instruction fetches and high-speed processing.

The on-chip ROM is enabled or disabled by setting the mode pins $\left(\mathrm{MD}_{2}, \mathrm{MD}_{1}\right.$, and $\left.\mathrm{MD}_{0}\right)$ and bit EAE in BCRL.

The PROM version of the H8S/2245 Group (H8S/2246) can be programmed with a generalpurpose PROM programmer, by setting PROM mode.

### 16.1.1 Block Diagram

Figure 16.1 shows a block diagram of the on-chip ROM.

Figure 16.1 Block Diagram of ROM (Example with H8S/2246 and H8S/2245 in Modes 6, 7)

### 16.1.2 Register Configuration

The on-chip ROM is controlled by BCRL. The register configuration is shown in table 16.1 .
Table 16.1 Register Configuration

|  |  | Initial Value |  |  |  |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| Name | Abbreviation | R/W | Power-On Reset | Manual Reset | Address* |
| Bus control register L | BCRL | R/W | H'3C | Retained | H'FED5 |

Note: * Lower 16 bits of the address.

### 16.2 Register Descriptions

### 16.2.1 Bus Control Register L (BCRL)

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | BRLE | BREQOE | EAE | - | - | ASS | - | WAITE |
| Initial value | 0 | 0 | 1 | 1 | 1 | 1 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

BCRL is an 8-bit readable/writable register that performs selection of the external bus release state protocol, selection of the area partition unit, and enabling or disabling of $\overline{\text { WAIT }}$ pin input.

BCRL is initialized to $\mathrm{H}^{\prime} 3 \mathrm{C}$ by a power-on reset and in hardware standby mode. It is not initialized by a manual reset or in software standby mode.

Enabling or disabling of part of the on-chip ROM area can be selected by means of the EAE bit in BCRL. For details of the other bits in BCRL, see section 6.2.5, Bus Control Register L (BCRL).

Bit 5—External Address Enable (EAE): Selects whether addresses H'010000 to H'01FFFF are to be internal addresses or external addresses.

This setting is invalid in normal mode.
Bit 5
EAE Description

| 0 | Addresses H'010000 to H'01FFFF are in on-chip ROM (in the H8S/2246 and |
| :--- | :--- |
|  | H8S/2245) or a reserved area* (in the H8S/2244, H8S/2243, H8S/2242, and |
|  | H8S/2241). |
| 1 | Addresses H'010000 to H'01FFFF are external addresses (external expansion mode) <br> or a reserved area* (single-chip mode). |

Note: * Reserved areas should not be accessed.

### 16.3 Operation

The on-chip ROM is connected to the CPU by a 16 -bit data bus, and both byte and word data can be accessed in one state. Even addresses are connected to the upper 8 bits, and odd addresses to the lower 8 bits. Word data must start at an even address.

The on-chip ROM is enabled and disabled by setting the mode pins $\left(\mathrm{MD}_{2}, \mathrm{MD}_{1}\right.$, and $\left.\mathrm{MD}_{0}\right)$ and bit EAE in BCRL. These settings are shown in table 16.2.

In the $\mathrm{H} 8 \mathrm{~S} / 2246, \mathrm{H} 8 \mathrm{~S} / 2245, \mathrm{H} 8 \mathrm{~S} / 2244$, and $\mathrm{H} 8 \mathrm{~S} / 2243$ normal mode, a maximum of 56 kbytes of ROM can be used.

Table 16.2 Operating Modes and ROM Area

| Operating Mode |  | Mode Pin Setting |  |  | $\begin{aligned} & \text { BCRL } \\ & \text { EAE } \end{aligned}$ | On-Chip ROM |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | MD ${ }_{2}$ | MD ${ }_{1}$ | MD |  | $\begin{aligned} & \hline \text { H8S/2246 and } \\ & \text { H8S/2245 } \end{aligned}$ | $\begin{aligned} & \text { H8S/2244 and } \\ & \text { H8S/2243 } \end{aligned}$ | H8S/2242 and H8S/2241 |
| Mode 1 | Normal expanded mode with on-chip ROM disabled | 0 | 0 | 1 | - | Disabled | Disabled | Disabled |
| Mode 2 | Normal expanded mode with on-chip ROM enabled |  | 1 | 0 | - | Enabled (56 kbytes) | Enabled (56 kbytes) | Enabled (32 kbytes) |
| Mode 3 | Normal single-chip mode |  |  | 1 |  |  |  |  |
| Mode 4 | Advanced expanded mode with on-chip ROM disabled | 1 | 0 | 0 | - | Disabled | Disabled | Disabled |
| Mode 5 | Advanced expanded mode with on-chip ROM disabled |  |  | 1 |  |  |  |  |
| Mode 6 | Advanced expanded mode with on-chip ROM enabled |  | 1 | 0 | 0 | Enabled <br> (128 kbytes) | Enabled (64 kbytes) | Enabled <br> (32 kbytes) |
|  |  |  |  |  | 1 | Enabled (64 kbytes) |  |  |
| Mode 7 | Advanced single-chip mode |  |  | 1 | 0 | Enabled (128 kbytes) |  |  |
|  |  |  |  |  | 1 | Enabled (64 kbytes) |  |  |

In H8S/2246 and H8S/2245 modes 6 and 7, the on-chip ROM available after a power-on reset is the 64 -kbyte area comprising addresses $\mathrm{H}^{\prime} 000000$ to $\mathrm{H}^{\prime} 00 \mathrm{FFFF}$.

### 16.4 PROM Mode

### 16.4.1 PROM Mode Setting

The PROM version of the H8S/2245 Group suspends its microcontroller functions when placed in PROM mode, enabling the on-chip PROM to be programmed. This programming can be done with a PROM programmer set up in the same way as for the HN27C101 EPROM ( $\mathrm{V}_{\mathrm{PP}}=12.5 \mathrm{~V}$ ). Use of a 100-pin/32-pin socket adapter enables programming with a commercial PROM programmer.

Note that the PROM programmer should not be set to page mode as the H8S/2245 Group does not support page programming.

Table 16.3 shows how PROM mode is selected.
Table 16.3 Selecting PROM Mode

| Pin Names | Setting |
| :--- | :--- |
| $\mathrm{MD}_{2}, \mathrm{MD}_{1}, \mathrm{MD}_{0}$ | Low |
| $\overline{\mathrm{STBY}}$ |  |
| $\mathrm{PA}_{2}, \mathrm{PA}_{1}$ | High |

### 16.4.2 Socket Adapter and Memory Map

Programs can be written and verified by attaching a 100-pin/32-pin socket adapter to the PROM programmer. Table 16.4 gives ordering information for the socket adapter, and figure 16.2 shows the wiring of the socket adapter. Figure 16.3 shows the memory map in PROM mode.

Figure 16.2 Wiring of 100-Pin/32-Pin Socket Adapter

Table 16.4 Socket Adapter

| Microcontroller | Package | Socket Adapter |
| :--- | :--- | :--- |
| H8S/2246 | 100 pin QFP (FP-100B) | HS2245ESHS1H |
|  | 100 pin TQFP (TFP-100B) | HS2245ESNS1H |

| Addresses in MCU mode |  | Addresses in PROM mode |
| :---: | :---: | :---: |
| H'000000 | On-chip PROM | H'00000 |
|  |  |  |
| H'01FFFF |  | H'1FFFF |

Figure 16.3 Memory Map in PROM Mode

### 16.5 Programming

### 16.5.1 Overview

Table 16.5 shows how to select the program, verify, and program-inhibit modes in PROM mode.
Table 16.5 Mode Selection in PROM Mode

| Mode | Pins |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

H: High voltage level
$\mathrm{V}_{\mathrm{pp}}$ : $\mathrm{V}_{\mathrm{PP}}$ voltage level
$\mathrm{V}_{\mathrm{cc}}: \mathrm{V}_{\mathrm{cc}}$ voltage level

Programming and verification should be carried out using the same specifications as for the standard HN27C101 EPROM.

However, do not set the PROM programmer to page mode does not support page programming. A PROM programmer that only supports page programming cannot be used. When choosing a PROM programmer, check that it supports high-speed programming in byte units. Always set addresses within the range $\mathrm{H}^{\prime} 00000$ to $\mathrm{H}^{\prime} 1 \mathrm{FFFF}$.

### 16.5.2 Programming and Verification

An efficient, high-speed programming procedure can be used to program and verify PROM data. This procedure writes data quickly without subjecting the chip to voltage stress or sacrificing data reliability. It leaves the data H'FF in unused addresses. Figure 16.4 shows the basic high-speed programming flowchart. Tables 16.6 and 16.7 list the electrical characteristics of the chip during programming. Figure 16.5 shows a timing chart.

Figure 16.4 High-Speed Programming Flowchart

Table 16.6 DC Characteristics in PROM Mode
When $\mathrm{V}_{\mathrm{CC}}=6.0 \mathrm{~V} \pm 0.25 \mathrm{~V}, \mathrm{~V}_{\mathrm{PP}}=12.5 \mathrm{~V} \pm 0.3 \mathrm{~V}, \mathrm{~V}_{\mathrm{SS}}=0 \mathrm{~V}, \mathrm{~T}_{\mathrm{a}}=25^{\circ} \mathrm{C} \pm 5^{\circ} \mathrm{C}$

Notes: 1. Input pulse level: 0.8 V to 2.2 V
Input rise time and fall time $\leq 20 \mathrm{~ns}$
Timing reference levels; Input: $1.0 \mathrm{~V}, 2.0 \mathrm{~V}$;
Output: $0.8 \mathrm{~V}, 2.0 \mathrm{~V}$
2. $t_{D F}$ is defined to be when output has reached the open state, and the output level can no longer be referenced.
3. $t_{\text {opw }}$ is defined by the value shown in the flowchart.

Figure 16.5 PROM Programming/Verification Timing

### 16.5.3 Programming Precautions

- Program using the specified voltages and timing.

The programming voltage ( $\mathrm{V}_{\mathrm{PP}}$ ) in PROM mode is 12.5 V .
If the PROM programmer is set to Renesas Technology HN27C101 specifications, $\mathrm{V}_{\mathrm{PP}}$ will be 12.5 V . Applied voltages in excess of the specified values can permanently destroy the MCU. Be particularly careful about the PROM programmer's overshoot characteristics.

- Before programming, check that the MCU is correctly mounted in the PROM programmer. Overcurrent damage to the MCU can result if the index marks on the PROM programmer, socket adapter, and MCU are not correctly aligned.
- Do not touch the socket adapter or MCU while programming. Touching either of these can cause contact faults and programming errors.
- The MCU cannot be programmed in page programming mode. Select the programming mode carefully.
- The size of the PROM is 128 kbytes. Always set addresses within the range $\mathrm{H}^{\prime} 00000$ to H'1FFFF. During programming, write H'FF to unused addresses to avoid verification errors.

### 16.5.4 Reliability of Programmed Data

An effective way to assure the data retention characteristics of the programmed chips is to bake them at $150^{\circ} \mathrm{C}$, then screen them for data errors. This procedure quickly eliminates chips with PROM cells prone to early failure.

Figure 16.6 shows the recommended screening procedure.

Figure 16.6 Recommended Screening Procedure
If a series of programming errors occurs while the same PROM programmer is being used, stop programming and check the PROM programmer and socket adapter for defects.

Please inform Renesas of any abnormal conditions noted during or after programming or in screening of program data after high-temperature baking.

## Section 17 Clock Pulse Generator

### 17.1 Overview

The H8S/2245 Group has a built-in clock pulse generator (CPG) that generates the system clock $(\phi)$, the bus master clock, and internal clocks.

The clock pulse generator consists of an oscillator circuit, a duty adjustment circuit, a mediumspeed clock divider, and a bus master clock selection circuit.

### 17.1.1 Block Diagram

Figure 17.1 shows a block diagram of the clock pulse generator.

Figure 17.1 Block Diagram of Clock Pulse Generator

### 17.1.2 Register Configuration

The clock pulse generator is controlled by SCKCR and LPWCR. Table 17.1 shows the register configuration.

Table 17.1 Clock Pulse Generator Register

| Name | Abbreviation | R/W | Initial Value | Address* |
| :--- | :--- | :--- | :--- | :--- |
| System clock control register | SCKCR | R/W | H'00 $^{\text {H }}$ | H'FF3A |
| Low power control register | LPWCR | R/W | H'00 | H'FF44 |

Note: * Lower 16 bits of the address.

### 17.2 Register Descriptions

### 17.2.1 System Clock Control Register (SCKCR)

| Bit | $:$ | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | PSTOP | - | - | - | - | SCK2 | SCK1 | SCK0 |  |
|  | Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | $:$ | R/W | R/W | - | - | - | R/W | R/W | R/W |

SCKCR is an 8-bit readable/writable register that performs $\phi$ clock output control and mediumspeed mode control.

SCKCR is initialized to $\mathrm{H}^{\prime} 00$ by a reset and in hardware standby mode. It is not initialized in software standby mode.

Bit 7— $\phi$ Clock Output Disable (PSTOP): Controls $\phi$ output.
Description

| Bit $\mathbf{7}$ |  | Slep Mode | Software <br> Standby Mode | Hardware <br> Standby Mode |
| :--- | :--- | :--- | :--- | :--- |
| PSTOP | Normal Operation | Sleep |  |  |
| 0 | $\phi$ output (initial value) | $\phi$ output | Fixed high | High impedance |
| 1 | Fixed high | Fixed high | Fixed high | High impedance |

Bit 6-Reserved: This bit can be read or written to, but only 0 should be written.
Bits 5 to 3-Reserved: Read-only bits, always read as 0 .
Bits 2 to 0—System Clock Select 2 to 0 (SCK2 to SCK0): These bits select the clock for the bus master.

| Bit $\mathbf{2}$ | Bit $\mathbf{1}$ | Bit $\mathbf{0}$ |  |  |
| :--- | :--- | :--- | :--- | :--- |
| SCK2 | SCK1 | SCK0 | Description | (Initial value) |
| 0 | 0 | 0 | Bus master is in high-speed mode |  |
|  |  | 1 | Medium-speed clock is $\phi / 2$ |  |
| 1 | 0 | Medium-speed clock is $\phi / 4$ |  |  |
| 1 | 0 | 0 | Medium-speed clock is $\phi / 8$ |  |
|  |  | 1 | Medium-speed clock is $\phi / 16$ |  |
|  | 1 | - | - |  |

### 17.2.2 Low Power Control Register (LPWCR)

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | - | - | RFCUT | - | - | - | - | - |
| Initial value: | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W | R/W |

LPWCR is an 8-bit readable/writable register that controls the oscillator's built-in feedback resistor when using external clock input.

LPWCR is initialized to $\mathrm{H}^{\prime} 00$ by a reset and in hardware standby mode. It is not initialized in software standby mode.

Bits 6 and 7-Reserved: These bits can be read or written to, but do not affect operation.
Bit 5—Built-in Feedback Resistor Control (RFCUT): Selects whether the oscillator's built-in feedback resistor and duty adjustment circuit are used with external clock input. Do not access this bit when a crystal oscillator is used.

When an external clock is input, a temporary transition should be made to software standby mode after setting this bit. When software standby mode is entered, it is possible to select use or non-use
of the oscillator's built-in feedback resistor and duty adjustment circuit. Software standby mode should then be exited by means of an external interrupt.

Bit 5
RFCUT Description

| 0 | Oscillator's built-in feedback resistor and duty adjustment circuit are used |
| :--- | :--- |
|  |  |
| 1 | Oscillator's built-in feedback resistor and duty adjustment circuit are not used |

Bits 4 to 0—Reserved: These bits can be read or written to, but do not affect operation.

### 17.3 Oscillator

Clock pulses can be supplied by connecting a crystal resonator, or by input of an external clock.

### 17.3.1 Connecting a Crystal Resonator

## Circuit Configuration

A crystal resonator can be connected as shown in the example in figure 17.2. Select the damping resistance $\mathrm{R}_{\mathrm{d}}$ according to table 17.2. An AT-cut parallel-resonance crystal should be used.

Figure 17.2 Connection of Crystal Resonator (Example)
Table 17.2 Damping Resistance Value

| Frequency (MHz) | $\mathbf{2}$ | $\mathbf{4}$ | $\mathbf{8}$ | $\mathbf{1 2}$ | $\mathbf{1 6}$ | $\mathbf{2 0}$ |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| $\mathbf{R}_{\mathrm{d}}(\Omega)$ | 1 k | 500 | 200 | 0 | 0 | 0 |

## Crystal resonator

Figure 17.3 shows the equivalent circuit of the crystal resonator. Use a crystal resonator that has the characteristics shown in table 17.3 and the same resonance frequency as the system clock $(\phi)$.

Figure 17.3 Crystal Resonator Equivalent Circuit
Table 17.3 Crystal Resonator Parameters

| Frequency (MHz) | $\mathbf{2}$ | $\mathbf{4}$ | $\mathbf{8}$ | $\mathbf{1 2}$ | $\mathbf{1 6}$ | $\mathbf{2 0}$ |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| $\mathbf{R}_{\mathrm{s}} \max (\boldsymbol{\Omega})$ | 500 | 120 | 80 | 60 | 50 | 40 |
| $\mathbf{C}_{0} \max (\mathbf{p F})$ | 7 | 7 | 7 | 7 | 7 | 7 |

## Note on Board Design

When a crystal resonator is connected, the following points should be noted:
Other signal lines should be routed away from the oscillator circuit to prevent induction from interfering with correct oscillation. See figure 17.4.

When designing the board, place the crystal resonator and its load capacitors as close as possible to the XTAL and EXTAL pins.

Figure 17.4 Example of Incorrect Board Design

### 17.3.2 External Clock Input

## Circuit Configuration

An external clock signal can be input as shown in the examples in figure 17.5. If the XTAL pin is left open, make sure that stray capacitance is no more than 10 pF .

In example (b), make sure that the external clock is held high in standby mode.

(a) XTAL pin left open

(b) Complementary clock input at XTAL pin

Figure 17.5 External Clock Input (Examples)

## External Clock

The external clock signal should have the same frequency as the system clock $(\phi)$.
Table 17.4 and figure 17.6 show the input conditions for the external clock.
Table 17.4 External Clock Input Conditions

| Item | Symbol | $\begin{gathered} \mathrm{V}_{\mathrm{cc}}=2.7 \mathrm{~V} \\ \text { to } 5.5 \mathrm{~V} \end{gathered}$ |  | $\begin{aligned} & \mathrm{V}_{\mathrm{cc}}=2.7 \mathrm{~V} \\ & \text { to } 5.5 \mathrm{~V} * \end{aligned}$ |  | $\begin{gathered} \mathrm{V}_{\mathrm{cc}}=5.0 \mathrm{~V} \\ \pm 10 \% \end{gathered}$ |  | Unit | Test Conditions |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | Min | Max | Min | Max | Min | Max |  |  |
| External clock input pulse width low level | $\mathrm{t}_{\text {ExL }}$ | 40 | - | 30 | - | 20 | - | ns | Figure 17.6 |
| External clock input pulse width high level | $t_{\text {EXH }}$ | 40 | - | 30 | - | 20 | - | ns |  |
| External clock rise time | $\mathrm{t}_{\text {EXr }}$ | - | 10 | - | 7.5 | - | 5 | ns |  |
| External clock fall time | $\mathrm{t}_{\text {EXf }}$ | - | 10 | - | 7.5 | - | 5 | ns |  |
| Clock pulse width low level | $\mathrm{t}_{\mathrm{CL}}$ | 0.4 | 0.6 | 0.4 | 0.6 | 0.4 | 0.6 | $\mathrm{t}_{\text {cyc }}$ | $\phi \geq 5 \mathrm{MHz}$ Figure |
|  |  | 80 | - | 80 | - | 80 | - | ns | $\phi<5 \mathrm{MHz} 19.4$ |
| Clock pulse width high level | $\mathrm{t}_{\mathrm{CH}}$ | 0.4 | 0.6 | 0.4 | 0.6 | 0.4 | 0.6 | $\mathrm{t}_{\text {cyc }}$ | $\phi \geq 5 \mathrm{MHz}$ |
|  |  | 80 | - | 80 | - | 80 | - | ns | $\phi<5 \mathrm{MHz}$ |

Note: * Does not apply to the HD6472246.

Table 17.5 and figure 17.6 show the external clock input conditions when the duty adjustment circuit is not used. When the duty adjustment circuit is not used, the $\phi$ output waveform depends on the external clock input waveform, and therefore no specifications are provided.

Table 17.5 External Clock Input Conditions when Duty Adjustment Circuit Is Not Used

| Item | Symbol | $\begin{gathered} \mathrm{V}_{\mathrm{cc}}=2.7 \mathrm{~V} \\ \text { to } 5.5 \mathrm{~V} \end{gathered}$ |  | $\begin{aligned} & \mathrm{V}_{\mathrm{cc}}=2.7 \mathrm{~V} \\ & \text { to } 5.5 \mathrm{~V} * \end{aligned}$ |  | $\begin{gathered} \mathrm{V}_{\mathrm{cc}}=5.0 \mathrm{~V} \\ \pm 10 \% \end{gathered}$ |  | Unit | Test Conditions |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | Min | Max | Min | Max | Min | Max |  |  |
| External clock input pulse width low level | $\mathrm{t}_{\text {ExL }}$ | 50 | - | 37.5 | - | 25 | - | ns | Figure 17.6 |
| External clock input pulse width high level | $t_{\text {EXH }}$ | 50 | - | 37.5 | - | 25 | - | ns |  |
| External clock rise time | $\mathrm{t}_{\text {EXI }}$ | - | 10 | - | 7.5 | - | 5 | ns |  |
| External clock fall time | $\mathrm{t}_{\text {EXf }}$ | - | 10 | - | 7.5 | - | 5 | ns |  |

Notes: When the duty adjustment circuit is not used, the maximum operating frequency falls according to the input waveform.
(Example: When $\mathrm{t}_{\mathrm{EXL}}=\mathrm{t}_{\mathrm{EXH}}=25 \mathrm{~ns}$ and $\mathrm{t}_{\mathrm{EXt}}=\mathrm{t}_{\mathrm{EXf}}=5 \mathrm{~ns}$, the clock cycle time $=60 \mathrm{~ns}$, and therefore the maximum operating frequency $=16.7 \mathrm{MHz}$.)

* Does not apply to the HD6472246.

Figure 17.6 External Clock Input Timing

## Note on External Clock Switchover

When using two or more external clocks (e.g. 10 MHz and 32 kHz ), input clock switchover should be carried out in software standby mode.

A sample external clock switching circuit is shown in figure 17.7, and sample external clock switchover timing in figure 17.8.

Figure 17.7 Sample External Clock Switching Circuit

Figure 17.8 Sample External Clock Switchover Timing

### 17.4 Duty Adjustment Circuit

When the oscillator frequency is 5 MHz or higher, the duty adjustment circuit adjusts the duty cycle of the clock signal from the oscillator to generate the system clock ( $\phi$ ).

### 17.5 Medium-Speed Clock Divider

The medium-speed clock divider divides the system clock to generate $\phi / 2, \phi / 4, \phi / 8, \phi / 16$, and $\phi / 32$.

### 17.6 Bus Master Clock Selection Circuit

The bus master clock selection circuit selects the system clock ( $\phi$ ) or one of the medium-speed clocks ( $\phi / 2, \phi / 4, \phi / 8, \phi / 16$, and $\phi / 32$ ) to be supplied to the bus master, according to the settings of the SCK2 to SCK0 bits in SCKCR.

### 17.7 Note on Crystal Resonator

As various characteristics related to the crystal resonator are closely linked to the user's board design, thorough evaluation is necessary on the user's part, using the resonator connection examples shown in this section as a guide. As the resonator circuit ratings will depend on the floating capacitance of the resonator and the mounting circuit, the ratings should be determined in consultation with the resonator manufacturer. The design must ensure that a voltage exceeding the maximum rating is not applied to the oscillator pin.

## Section 18 Power-Down Modes

### 18.1 Overview

In addition to the normal program execution state, the H8S/2245 Group has power-down modes in which operation of the CPU and oscillator is halted and power dissipation is reduced. Low-power operation can be achieved by individually controlling the CPU, on-chip supporting modules, and so on.

The H8S/2245 Group operating modes are as follows:
(1) High-speed mode
(2) Medium-speed mode
(3) Sleep mode
(4) Module stop mode
(5) Software standby mode
(6) Hardware standby mode

Of these, (2) to (6) are power-down modes. Sleep mode is a CPU mode, medium-speed mode is a CPU and bus master mode, and module stop mode is an on-chip supporting module mode (including bus masters other than the CPU). A combination of these modes can be set.

After a reset, the H8S/2245 Group is in high-speed mode.
Table 18.1 shows the conditions for transition to the various modes, the status of the CPU, on-chip supporting modules, etc., and the method of clearing each mode.

## Table 18.1 Operating Modes

| Operating Mode | Transition Condition | Clearing Condition | Oscillator | CPU |  | Modules |  | I/O Ports |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  |  |  |  | Registers |  | Registers |  |
| High speed mode | Control register |  | Functions | High speed | Functions | High speed | Functions | High speed |
| Mediumspeed mode | Control register |  | Functions | Medium speed | Functions | High/ medium speed* ${ }^{1}$ | Functions | High speed |
| Sleep mode | Instruction | Interrupt | Functions | Halted | Retained | High speed | Functions | High speed |
| Module stop <br> mode | Control register |  | Functions | High/ medium speed | Functions | Halted | Retained/ reset* ${ }^{2}$ | Retained |
| Software standby mode | Instruction | External interrupt | Halted | Halted | Retained | Halted | Retained/ reset* ${ }^{2}$ | Retained |
| Hardware standby mode | Pin |  | Halted | Halted | Undefined | Halted | Reset | High impedance |

Notes: 1. The bus master operates on the medium-speed clock, and other on-chip supporting modules on the high-speed clock.
2. The SCl and $\mathrm{A} / \mathrm{D}$ are reset, and other on-chip supporting modules retain their state.

### 18.1.1 Register Configuration

Power-down modes are controlled by the SBYCR, SCKCR, and MSTPCR registers. Table 18.2 summarizes these registers.

Table 18.2 Power-Down Mode Registers

| Name | Abbreviation | R/W | Initial Value | Address* |
| :---: | :---: | :---: | :---: | :---: |
| Standby control register | SBYCR | R/W | H'08 | H'FF38 |
| System clock control register | SCKCR | R/W | H'00 | H'FF3A |
| Module stop control register H | MSTPCRH | R/W | H'3F | H'FF3C |
| Module stop control register L | MSTPCRL | R/W | H'FF | H'FF3D |

Note: * Lower 16 bits of the address.

### 18.2 Register Descriptions

### 18.2.1 Standby Control Register (SBYCR)

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | SSBY | STS2 | STS1 | STSO | OPE | - | - | - |
| Initial value | 0 | 0 | 0 | 0 | 1 | 0 | 0 | 0 |
| R/W | R/W | R/W | R/W | R/W | R/W | - | - | - |

SBYCR is an 8-bit readable/writable register that performs software standby mode control.
SBYCR is initialized to $\mathrm{H}^{\prime} 08$ by a reset and in hardware standby mode. It is not initialized in software standby mode.

Bit 7—Software Standby (SSBY): Specifies a transition to software standby mode. Remains set to 1 when software standby mode is released by an external interrupt, and a transition is made to normal operation. The SSBY bit should be cleared by writing 0 to it.

Bit 7
SSBY Description

| 0 | Transition to sleep mode after execution of SLEEP instruction | (Initial value) |
| :--- | :--- | :--- |
| 1 | Transition to software standby mode after execution of SLEEP instruction |  |

Bits 6 to 4—Standby Timer Select $\mathbf{2}$ to 0 (STS2 to STS0): These bits select the time the MCU waits for the clock to stabilize when software standby mode is cleared by an external interrupt. With crystal oscillation, refer to table 18.4 and make a selection according to the operating frequency so that the standby time is at least 8 ms (the oscillation stabilization time). With an external clock, any selection can be made.

| Bit $\mathbf{6}$ | Bit $\mathbf{5}$ | Bit $\mathbf{4}$ |  |  |
| :--- | :--- | :--- | :--- | :--- |
| STS2 | STS1 | STS0 | Description | (Initial value) |
| 0 | 0 | 0 | Standby time $=8192$ states |  |
|  |  | 1 | Standby time $=16384$ states |  |
|  | 1 | 0 | Standby time $=32768$ states |  |
| 1 | 0 | $\frac{0}{1}$ | Standby time $=65536$ states |  |
|  | 1 | 0 | Standby time $=131072$ states |  |
|  |  | Standby time $=262144$ states |  |  |

Bit 3—Output Port Enable (OPE): Specifies whether the output of the address bus and bus control signals ( $\overline{\mathrm{CS} 0}$ to $\overline{\mathrm{CS} 3}, \overline{\mathrm{AS}}, \overline{\mathrm{RD}}, \overline{\mathrm{HWR}}, \overline{\mathrm{LWR}}$ ) is retained or set to the high-impedance state in software standby mode.

Bit 3

| OPE | Description |
| :--- | :--- |
| 0 | In software standby mode, address bus and bus control signals are high-impedance |
| 1 | In software standby mode, address bus and bus control signals retain output state |
|  | (Initial value) |

Bits 2 to 0—Reserved: Read-only bits, always read as 0 .

### 18.2.2 System Clock Control Register (SCKCR)

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | PSTOP | - | - | - | - | SCK2 | SCK1 | SCKO |
| Initial value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| R/W | R/W | R/W | - | - | - | R/W | R/W | R/W |

SCKCR is an 8-bit readable/writable register that performs $\phi$ clock output control and mediumspeed mode control.

SCKCR is initialized to $\mathrm{H}^{\prime} 00$ by a reset and in hardware standby mode. It is not initialized in software standby mode.

Bit 7— $\phi$ Clock Output Disable (PSTOP): Controls $\phi$ output.

## Description

| Bit $\mathbf{7}$ | Normal Operating | Sleep Mode | Software Standby <br> Mode | Hardware Standby <br> Mode |
| :--- | :--- | :--- | :--- | :--- |
| PSTOP | Mode |  |  |  |

Bits 6-Reserved: This bit can be read or written to, but only 0 should be written.
Bits 5 to 3-Reserved: Read-only bits, always read as 0 .
Bits 2 to 0—System Clock Select (SCK2 to SCK0): These bits select the clock for the bus master.

| Bit 2 | Bit 1 | Bit 0 |  |  |
| :--- | :--- | :--- | :--- | :--- |
| SCK2 | SCK1 | SCK0 | Description |  |
| 0 | 0 | 0 | Bus master in high-speed mode | (Initial value) |
|  |  | 1 | Medium-speed clock is $\phi / 2$ |  |
| 1 | 0 | Medium-speed clock is $\phi / 4$ |  |  |
| 1 | 0 | 0 | Medium-speed clock is $\phi / 8$ | Medium-speed clock is $\phi / 16$ |
|  |  | 1 | Medium-speed clock is $\phi / 32$ |  |
|  |  |  | - |  |

### 18.2.3 Module Stop Control Register (MSTPCR)

R/W : R/W R/W R/W R/W R/W R/W R/W R/W R/W R/W R/W R/W R/W R/W R/W R/W

MSTPCR is a 16-bit readable/writable register that performs module stop mode control.

MSTPCR is initialized to H'3FFF by a reset and in hardware standby mode. It is not initialized in software standby mode.

Bits 15 to 0—Module Stop (MSTP 15 to MSTP 0): These bits specify module stop mode. See table 18.3 for the method of selecting on-chip supporting modules.

## Bits 15 to 0

MSTP15 to MSTPO Description

| 0 | Module stop mode cleared |
| :--- | :--- |
| 1 | Module stop mode set |

### 18.3 Medium-Speed Mode

When the SCK2 to SCK0 bits in SCKCR are set to 1, the operating mode changes to mediumspeed mode at the end of the bus cycle. In medium-speed mode, the CPU operates on the operating clock $(\phi / 2, \phi / 4, \phi / 8, \phi / 16$, or $\phi / 32$ ) specified by the SCK 2 to SCK 0 bits. The bus masters other than the CPU (DTC) also operate in medium-speed mode. On-chip supporting modules other than the bus masters always operate on the high-speed clock $(\phi)$.

In medium-speed mode, a bus access is executed in the specified number of states with respect to the bus master operating clock. For example, if $\phi / 4$ is selected as the operating clock, on-chip memory is accessed in 4 states, and internal I/O registers in 8 states.

Medium-speed mode is cleared by clearing all of bits SCK2 to SCK0 to 0. A transition is made to high-speed mode and medium-speed mode is cleared at the end of the current bus cycle.

If a SLEEP instruction is executed when the SSBY bit in SBYCR is cleared to 0 , a transition is made to sleep mode. When sleep mode is cleared by an interrupt, medium-speed mode is restored.

If a SLEEP instruction is executed when the SSBY bit in SBYCR is set to 1 , a transition is made to software standby mode. When software standby mode is cleared by an external interrupt, medium-speed mode is restored.

When the $\overline{\mathrm{RES}}$ pin is driven low, a transition is made to the reset state, and medium-speed mode is cleared. The same applies in the case of a reset caused by overflow of the watchdog timer.

When the $\overline{\text { STBY }}$ pin is driven low, a transition is made to hardware standby mode.

Figure 18.1 shows the timing for transition to and clearance of medium-speed mode.

Figure 18.1 Medium-Speed Mode Transition and Clearance Timing

### 18.4 Sleep Mode

If a SLEEP instruction is executed when the SSBY bit in SBYCR is cleared to 0 , the CPU enters sleep mode. In sleep mode, CPU operation stops but the contents of the CPU's internal registers are retained. Other supporting modules do not stop.

Sleep mode is cleared by a reset or any interrupt, and the CPU returns to the normal program execution state via the exception handling state. Sleep mode is not cleared if interrupts are disabled, or if interrupts other than NMI are masked by the CPU.

When the STBY pin is driven low, a transition is made to hardware standby mode.

### 18.5 Module Stop Mode

### 18.5.1 Module Stop Mode

Module stop mode can be set for individual on-chip supporting modules.
When the corresponding MSTP bit in MSTPCR is set to 1 , module operation stops at the end of the bus cycle and a transition is made to module stop mode. The CPU continues operating independently.

Table 18.3 shows MSTP bits and the corresponding on-chip supporting modules.

When the corresponding MSTP bit is cleared to 0 , module stop mode is cleared and the module starts operating again at the end of the bus cycle. In module stop mode, the internal states of modules other than the SCI and $\mathrm{A} / \mathrm{D}$ are retained.

After reset clearance, all modules other than DTC are in module stop mode.

When an on-chip supporting module is in module stop mode, read/write access to its registers is disabled.

If a transition is made to sleep mode when all modules are stopped (MSTPCR $=\mathrm{H}^{\prime} \mathrm{FFFF}$ ) or modules other than the 8-bit timers are stopped (MSTPCR $\left.=H^{\prime} E F F F\right)$, operation of the bus controller and I/O ports is also halted, enabling current dissipation to be further reduced.

Table 18.3 MSTP Bits and Corresponding On-Chip Supporting Modules

| Register | Bit | Module |
| :---: | :---: | :---: |
| MSTPCRH | MSTP15 | - |
|  | MSTP14 | Data transfer controller (DTC) |
|  | MSTP13 | 16-bit timer pulse unit (TPU) |
|  | MSTP12 | 8 -bit timer |
|  | MSTP11 | - |
|  | MSTP10 | - |
|  | MSTP9 | A/D converter |
|  | MSTP8 | - |
| MSTPCRL | MSTP7 | Serial communication interface (SCI) channel 2 |
|  | MSTP6 | Serial communication interface (SCI) channel 1 |
|  | MSTP5 | Serial communication interface (SCl) channel 0 |
|  | MSTP4 | - |
|  | MSTP3 | - |
|  | MSTP2 | - |
|  | MSTP1 | - |
|  | MSTP0 | - |

Note: Bits $15,11,10,8$, and 4 to 0 can be read or written to, but do not affect operation.

### 18.5.2 Usage Notes

DTC Module Stop Mode: Depending on the operating status of the DTC, the MSTP14 bit may not be set to 1 . Setting of the DTC module stop mode should be carried out only when the DTC is not activated.

For details, refer to section 7, Data Transfer Controller.
On-Chip Supporting Module Interrupts: Relevant interrupt operations cannot be performed in module stop mode. Consequently, if module stop mode is entered when an interrupt has been requested, it will not be possible to clear the CPU interrupt source or DTC activation source. Interrupts should therefore be disabled before entering module stop mode.

Writing to MSTPCR: MSTPCR should only be written to by the CPU.

### 18.6 Software Standby Mode

### 18.6.1 Software Standby Mode

If a SLEEP instruction is executed when the SSBY bit in SBYCR is set to 1 , software standby mode is entered. In this mode, the CPU, on-chip supporting modules, and oscillator all stop. However, the contents of the CPU's internal registers, RAM data, and the states of on-chip supporting modules other than the SCI and A/D, and I/O ports, are retained. Whether the address bus and bus control signals are placed in the high-impedance state or retain the output state can be specified by the OPE bit in SBYCR.

In this mode the oscillator stops, and therefore power dissipation is significantly reduced.

### 18.6.2 Clearing Software Standby Mode

Software standby mode is cleared by an external interrupt (NMI pin, or pins $\overline{\text { IRQ0 }}$ to $\overline{\text { IRQ2 }}$ ), or by means of the $\overline{\mathrm{RES}}$ pin or $\overline{\text { STBY }}$ pin.

## Clearing with an Interrupt

When an NMI or IRQ0 to IRQ2 interrupt request signal is input, clock oscillation starts, and after the elapse of the time set in bits STS2 to STS0 in SBYCR, stable clocks are supplied to the entire H8S/2245 Group chip, software standby mode is cleared, and interrupt exception handling is started.

When clearing software standby mode with an IRQ0 to IRQ2 interrupt, set the corresponding enable bit to 1 and ensure that no interrupt with a higher priority than interrupts IRQ0 to IRQ2 is generated. Software standby mode cannot be cleared if the interrupt has been masked on the CPU side or has been designated as a DTC activation source.

## Clearing with the $\overline{\text { RES }}$ Pin

When the $\overline{\mathrm{RES}}$ pin is driven low, clock oscillation is started. At the same time as clock oscillation starts, clocks are supplied to the entire H8S/2245 Group chip. Note that the $\overline{\mathrm{RES}}$ pin must be held low until clock oscillation stabilizes. When the $\overline{\text { RES }}$ pin goes high, the CPU begins reset exception handling.

## Clearing with the $\overline{\text { STBY }}$ Pin

When the $\overline{\text { STBY }}$ pin is driven low, a transition is made to hardware standby mode.

### 18.6.3 Setting Oscillation Stabilization Time after Clearing Software Standby Mode

Bits STS2 to STS0 in SBYCR should be set as described below.

## Using a Crystal Oscillator

Set bits STS2 to STS0 so that the standby time is at least 8 ms (the oscillation stabilization time).
Table 18.4 shows the standby times for different operating frequencies and settings of bits STS2 to STSO.

Table 18.4 Oscillation Stabilization Time Settings

| STS2 | STS1 | STSO | Standby Time | $\begin{aligned} & 20 \\ & \mathrm{MHz} \end{aligned}$ | $\begin{aligned} & 16 \\ & \mathrm{MHz} \end{aligned}$ | $\begin{aligned} & 12 \\ & \mathrm{MHz} \end{aligned}$ | $\begin{aligned} & 10 \\ & \mathrm{MHz} \end{aligned}$ | $\begin{aligned} & 8 \\ & \mathrm{MHz} \end{aligned}$ | $\begin{aligned} & 6 \\ & \mathrm{MHz} \end{aligned}$ | $\begin{aligned} & 4 \\ & \mathrm{MHz} \end{aligned}$ | $\begin{aligned} & 2 \\ & \mathrm{MHz} \end{aligned}$ | Unit |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 0 | 0 | 0 | 8192 states | 0.41 | 0.51 | 0.68 | 0.82 | 1.0 | 1.4 | 2.0 | 4.1 | ms |
|  |  | 1 | 16384 states | 0.82 | 1.0 | 1.4 | 1.6 | 2.0 | 2.7 | 4.1 | 8.2 |  |
|  | 1 | 0 | 32768 states | 1.6 | 2.0 | 2.7 | 3.3 | 4.1 | 5.5 | 8.2 | 16.4 |  |
|  |  | 1 | 65536 states | 3.3 | 4.1 | 5.5 | 6.6 | 8.2 | 10.9 | 16.4 | 32.8 |  |
| 1 | 0 | 0 | 131072 states | 6.6 | 8.2 | 10.9 | 13.1 | 16.4 | 21.8 | 32.8 | 65.5 |  |
|  |  | 1 | 262144 states | 13.1 | 16.4 | 21.8 | 26.2 | 32.8 | 43.7 | 65.5 | 131.1 |  |
|  | 1 | 0 | Reserved | - | - | - | - | - | - | - | - | - |
|  |  | 1 | 16 states | 0.8 | 1.0 | 1.3 | 1.6 | 2.0 | 2.7 | 4.0 | 8.0 | $\mu \mathrm{s}$ |

$\square$ Recommended time setting

## Using an External Clock

Any value can be set. Normally, use of the minimum time is recommended.

### 18.6.4 Software Standby Mode Application Example

Figure 18.2 shows an example in which a transition is made to software standby mode at the falling edge on the NMI pin, and software standby mode is cleared at the rising edge on the NMI pin.

In this example, an NMI interrupt is accepted with the NMIEG bit in SYSCR cleared to 0 (falling edge specification), then the NMIEG bit is set to 1 (rising edge specification), the SSBY bit is set to 1 , and a SLEEP instruction is executed, causing a transition to software standby mode.

Software standby mode is then cleared at the rising edge on the NMI pin.

Figure 18.2 Software Standby Mode Application Example

### 18.6.5 Usage Notes

I/O Port Status: In software standby mode, I/O port states are retained. If the OPE bit is set to 1 , the address bus and bus control signal output is also retained. Therefore, there is no reduction in current dissipation for the output current when a high-level signal is output.

Current Dissipation during Oscillation Stabilization Wait Period: Current dissipation increases during the oscillation stabilization wait period.

### 18.7 Hardware Standby Mode

### 18.7.1 Hardware Standby Mode

When the $\overline{\text { STBY }}$ pin is driven low, a transition is made to hardware standby mode from any mode.
In hardware standby mode, all functions enter the reset state and stop operation, resulting in a significant reduction in power dissipation. As long as the prescribed voltage is supplied, on-chip RAM data is retained. I/O ports are set to the high-impedance state.

In order to retain on-chip RAM data, the RAME bit in SYSCR should be cleared to 0 before driving the $\overline{\text { STBY }}$ pin low.

Do not change the state of the mode pins $\left(\mathrm{MD}_{2}\right.$ to $\left.\mathrm{MD}_{0}\right)$ while the $\mathrm{H} 8 \mathrm{~S} / 2245$ Group is in hardware standby mode.

Hardware standby mode is cleared by means of the $\overline{\text { STBY }}$ pin and the $\overline{\operatorname{RES}}$ pin. When the $\overline{\text { STBY }}$ pin is driven high while the $\overline{\mathrm{RES}}$ pin is low, the reset state is set and clock oscillation is started. Ensure that the $\overline{\mathrm{RES}}$ pin is held low until the clock oscillation stabilizes (at least $\mathrm{t}_{\text {oSCl }}$-the oscillation stabilization time-when using a crystal oscillator). When the $\overline{\mathrm{RES}}$ pin is subsequently driven high, a transition is made to the program execution state via the reset exception handling state.

### 18.7.2 Hardware Standby Mode Timing

Figure 18.3 shows an example of hardware standby mode timing.
When the $\overline{\text { STBY }}$ pin is driven low after the $\overline{\mathrm{RES}}$ pin has been driven low, a transition is made to hardware standby mode. Hardware standby mode is cleared by driving the $\overline{\text { STBY }}$ pin high, waiting for the oscillation stabilization time, then changing the $\overline{\mathrm{RES}}$ pin from low to high.

Figure 18.3 Hardware Standby Mode Timing (Example)

## 18.8 $\phi$ Clock Output Disabling Function

Output of the $\phi$ clock can be controlled by means of the PSTOP bit in SCKCR and DDR for the corresponding port. When the PSTOP bit is set to 1 , the $\phi$ clock stops at the end of the bus cycle, and $\phi$ output goes high. $\phi$ clock output is enabled when the PSTOP bit is cleared to 0 . When DDR for the corresponding port is cleared to $0, \phi$ clock output is disabled and input port mode is set. Table 18.5 shows the state of the $\phi$ pin in each processing mode.

Table 18.5 $\phi$ Pin State in Each Processing Mode

| Register Settings |  |  |  | Software <br> Standby Mode | Hardware <br> Standby Mode |
| :--- | :--- | :--- | :--- | :--- | :--- |
| 0 | PSTOP | Normal Mode | Sleep Mode | High impedance | High impedance | High impedance | High impedance |
| :--- |
| 1 |

## Section 19 Electrical Characteristics

### 19.1 Absolute Maximum Ratings

Table 19.1 lists the absolute maximum ratings.
Table 19.1 Absolute Maximum Ratings

| Item | Symbol | Value | Unit |
| :--- | :--- | :--- | :--- |
| Power supply voltage | $\mathrm{V}_{\mathrm{cc}}$ | -0.3 to +7.0 | V |
| Programming voltage | $\mathrm{V}_{\mathrm{PP}}$ | -0.3 to +13.5 | V |
| Input voltage (except port 4) | $\mathrm{V}_{\text {in }}$ | -0.3 to $\mathrm{V}_{\mathrm{cc}}+0.3$ | V |
| Input voltage (port 4) | $\mathrm{V}_{\text {in }}$ | -0.3 to $\mathrm{AV}_{\mathrm{cc}}+0.3$ | V |
| Reference voltage | $\mathrm{V}_{\text {ref }}$ | -0.3 to $\mathrm{AV}_{\mathrm{cc}}+0.3$ | V |
| Analog power supply voltage | $\mathrm{AV}_{\mathrm{cc}}$ | -0.3 to +7.0 | V |
| Analog input voltage | $\mathrm{V}_{\mathrm{AN}}$ | -0.3 to $\mathrm{AV} \mathrm{CC}+0.3$ | V |
| Operating temperature | $\mathrm{T}_{\text {opr }}$ | Regular specifications: -20 to +75 | ${ }^{\circ} \mathrm{C}$ |
| Storage temperature |  | $\mathrm{T}_{\text {stg }}$ | -55 to +125 |
| ${ }^{\circ} \mathrm{C}$ |  |  |  |

Caution: Permanent damage to the chip may result if absolute maximum ratings are exceeded.

### 19.2 Power Supply Voltage and Operating Frequency Ranges

Power supply voltage and operating frequency ranges (shaded areas) are shown in table 19.2.

## Table 19.2 Power Supply Voltage and Operating Frequency Ranges

Condition A: All H8S/2245 Group products
$\mathrm{V}_{\mathrm{CC}}=2.7 \mathrm{~V}$ to $5.5 \mathrm{~V}, \mathrm{AV}_{\mathrm{CC}}=2.7 \mathrm{~V}$ to $5.5 \mathrm{~V}, \mathrm{~V}_{\mathrm{ref}}=2.7 \mathrm{~V}$ to $\mathrm{AV}_{\mathrm{CC}}, \mathrm{V}_{\mathrm{SS}}=\mathrm{AV}_{\mathrm{SS}}=0 \mathrm{~V}$, $\phi=32 \mathrm{kHz}$ to $10 \mathrm{MHz}, \mathrm{T}_{\mathrm{a}}=-20^{\circ} \mathrm{C}$ to $+75^{\circ} \mathrm{C}$ (regular specifications),
$\mathrm{T}_{\mathrm{a}}=-40^{\circ} \mathrm{C}$ to $+85^{\circ} \mathrm{C}$ (wide-range specifications)
Condition B: HD6432246, HD6432245, HD6432244, HD6432243, HD6432242, HD6432241R, HD6412240
$\mathrm{V}_{\mathrm{CC}}=2.7 \mathrm{~V}$ to $5.5 \mathrm{~V}, \mathrm{AV}_{\mathrm{CC}}=2.7 \mathrm{~V}$ to $5.5 \mathrm{~V}, \mathrm{~V}_{\text {ref }}=2.7 \mathrm{~V}$ to $\mathrm{AV}_{\mathrm{CC}}, \mathrm{V}_{\mathrm{SS}}=\mathrm{AV}_{\mathrm{SS}}=0 \mathrm{~V}$, $\phi=32 \mathrm{kHz}$ to $13 \mathrm{MHz}, \mathrm{T}_{\mathrm{a}}=-20^{\circ} \mathrm{C}$ to $+75^{\circ} \mathrm{C}$ (regular specifications), $\mathrm{T}_{\mathrm{a}}=-40^{\circ} \mathrm{C}$ to $+85^{\circ} \mathrm{C}$ (wide-range specifications)

Condition C: All H8S/2245 Group products
$\mathrm{V}_{\mathrm{CC}}=5.0 \mathrm{~V} \pm 10 \%, \mathrm{AV}_{\mathrm{CC}}=5.0 \mathrm{~V} \pm 10 \%, \mathrm{~V}_{\text {ref }}=4.5 \mathrm{~V}$ to $\mathrm{AV}_{\mathrm{CC}}, \mathrm{V}_{\mathrm{SS}}=\mathrm{AV}_{\mathrm{SS}}=0 \mathrm{~V}, \phi=$ 2 MHz to $20 \mathrm{MHz}, \mathrm{T}_{\mathrm{a}}=-20^{\circ} \mathrm{C}$ to $+75^{\circ} \mathrm{C}$ (regular specifications),
$\mathrm{T}_{\mathrm{a}}=-40^{\circ} \mathrm{C}$ to $+85^{\circ} \mathrm{C}$ (wide-range specifications)

| Clock Supply Method | Crystal Resonator Connection | External Clock Input |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
| Operating Modules | All Modules | DTC, TPU, SCI, A/D Converter | CPU, I/O Ports, <br> Bus Controller, 8 -Bit Timers, Interrupt Controller, WDT |  |  |
| Condition A |  |  | Nom- |  | $\underbrace{2}_{v_{c c}^{5.5}(\mathrm{~V})}$ |
| Condition B |  |  |  |  |  |
| Condition C |  |  |  |  |  |

### 19.3 DC Characteristics

Table 19.3 lists the DC characteristics. Table 19.4 lists the permissible output currents.
Table 19.3 DC Characteristics (1)
Conditions: $\mathrm{V}_{\mathrm{CC}}=5.0 \mathrm{~V} \pm 10 \%, \mathrm{AV}_{\mathrm{CC}}=5.0 \mathrm{~V} \pm 10 \%, \mathrm{~V}_{\mathrm{ref}}=4.5 \mathrm{~V}$ to $\mathrm{AV}_{\mathrm{CC}}, \mathrm{V}_{\mathrm{SS}}=\mathrm{AV}_{\mathrm{SS}}=0 \mathrm{~V}^{*}, \mathrm{~T}_{\mathrm{a}}$ $=-20$ to $+75^{\circ} \mathrm{C}$ (regular specifications), $\mathrm{T}_{\mathrm{a}}=-40$ to $+85^{\circ} \mathrm{C}$ (wide-range specifications)

| Item |  | Symbol | Min | Typ | Max | Unit | Test Conditions |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Schmitt trigger input voltage | Port 2, <br> $\overline{\mathrm{IRQ0}}$ to $\overline{\mathrm{IRQ}}$ | $\mathrm{V}_{\text {- }}{ }^{-}$ | 1.0 | - | - | V |  |

|  | Idle |  | - | 0.01 | 5.0 | $\mu \mathrm{A}$ |  |
| RAM standby voltage |  | $\mathrm{V}_{\text {RAM }}$ | 2.0 | - | - | V |  |

Notes: 1. If the $A / D$ converter is not used, do not leave the $A V_{c c}, A V_{s s}$, and $V_{\text {ref }}$ pins open.
Connect $\mathrm{AV}_{\mathrm{cc}}$ and $\mathrm{V}_{\text {ref }}$ to $\mathrm{V}_{\mathrm{c}}$, and connect $\mathrm{AV}_{\mathrm{ss}}$ to $\mathrm{V}_{\mathrm{ss}}$.
2. Current dissipation values are for $\mathrm{V}_{\mathrm{H}} \mathrm{min}=\mathrm{V}_{\mathrm{cc}}-0.5 \mathrm{~V}$ and $\mathrm{V}_{\mathrm{LL}} \max =0.5 \mathrm{~V}$ with all output pins unloaded and the on-chip pull-up transistors in the off state.
3. The values are for $\mathrm{V}_{\text {RAM }} \leq \mathrm{V}_{\mathrm{cc}}<4.5 \mathrm{~V}, \mathrm{~V}_{\mathrm{IH}} \min =\mathrm{V}_{\mathrm{CC}} \times 0.9$, and $\mathrm{V}_{\mathrm{IL}} \max =0.3 \mathrm{~V}$.
4. $I_{c c}$ depends on $V_{c c}$ and $f$ as follows:
$\mathrm{I}_{\mathrm{cc}} \mathrm{max}=2.0(\mathrm{~mA})+0.67(\mathrm{~mA} /(\mathrm{MHz} \times \mathrm{V})) \times \mathrm{V}_{\mathrm{cc}} \times \mathrm{f}$ [normal mode]
$\mathrm{I}_{\mathrm{cc}} \max =2.0(\mathrm{~mA})+0.48(\mathrm{~mA} /(\mathrm{MHz} \times \mathrm{V})) \times \mathrm{V}_{\mathrm{cc}} \times \mathrm{f}$ [sleep mode]
$\mathrm{I}_{\mathrm{cc}} \max =2.0(\mathrm{~mA})+0.07(\mathrm{~mA} /(\mathrm{MHz} \times \mathrm{V})) \times \mathrm{V}_{\mathrm{cc}} \times \mathrm{f}$ [sleep, all module stop and medium speed ( $\phi / 32$ ) mode]

## Table 19.3 DC Characteristics (2)

Conditions: $\mathrm{V}_{\mathrm{cC}}=2.7 \mathrm{~V}$ to $5.5 \mathrm{~V}, \mathrm{AV}_{\mathrm{cC}}=2.7 \mathrm{~V}$ to $5.5 \mathrm{~V}, \mathrm{~V}_{\text {ref }}=2.7 \mathrm{~V}$ to $\mathrm{AV}_{\mathrm{c}}$,
$\mathrm{V}_{\mathrm{ss}}=\mathrm{AV}_{\mathrm{sS}}=0 \mathrm{~V}^{* 1}, \mathrm{~T}_{\mathrm{a}}=-20$ to $+75^{\circ} \mathrm{C}$ (regular specifications),
$\mathrm{T}_{\mathrm{a}}=-40$ to $+85^{\circ} \mathrm{C}$ (wide-range specifications)

| Item |  | Symbol | Min | Typ | Max | Unit | Test Conditions |

| Item |  | Symbol | Min | Typ | Max | Unit | Test Conditions |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Current dissipation* ${ }^{2}$ | Standby mode* | $\mathrm{I}_{\mathrm{cc}} *^{4}$ | - | 0.01 | 5.0 | $\mu \mathrm{A}$ | $\mathrm{T}_{\mathrm{a}} \leq 50^{\circ} \mathrm{C}$ |
|  |  |  | - | - | 20.0 |  | $50^{\circ} \mathrm{C}<\mathrm{T}_{\mathrm{a}}$ |
| Analog power supply current | During A/D | $\mathrm{Al}_{\mathrm{cc}}$ | - | 0.4 | 1.0 | mA | $\mathrm{AV}_{\mathrm{cc}}=3.0 \mathrm{~V}$ |
|  | conversion |  | - | 1.2 | - | mA | $\mathrm{AV}_{\mathrm{cc}}=5.0 \mathrm{~V}$ |
|  | Idle |  | - | 0.01 | 5.0 | $\mu \mathrm{A}$ |  |
| Reference power supply current | During A/D conversion | $\mathrm{Al}_{\mathrm{cc}}$ | - | 0.3 | 0.6 | mA | $\mathrm{V}_{\text {ref }}=3.0 \mathrm{~V}$ |
|  |  |  | - | 0.5 | - | mA | $\mathrm{V}_{\text {ref }}=5.0 \mathrm{~V}$ |
|  | Idle |  | - | 0.01 | 5.0 | $\mu \mathrm{A}$ |  |
| RAM standby voltage |  | $\mathrm{V}_{\text {RAM }}$ | 2.0 | - | - | V |  |

Notes: 1. If the $A / D$ converter is not used, do not leave the $A V_{c c}, A V_{s s}$, and $V_{\text {ref }}$ pins open. Connect $\mathrm{AV}_{\mathrm{cc}}$ and $\mathrm{V}_{\text {ref }}$ to $\mathrm{V}_{\mathrm{c}}$, and connect $\mathrm{AV}_{\mathrm{ss}}$ to $\mathrm{V}_{\mathrm{ss}}$.
2. Current dissipation values are for $\mathrm{V}_{\mathrm{tH}} \min =\mathrm{V}_{\mathrm{cc}}-0.5 \mathrm{~V}$ and $\mathrm{V}_{\mathrm{tL}} \max =0.5 \mathrm{~V}$ with all output pins unloaded and the on-chip pull-up transistors in the off state.
3. The values are for $\mathrm{V}_{\text {RAM }} \leq \mathrm{V}_{\mathrm{cC}}<2.7 \mathrm{~V}, \mathrm{~V}_{\mathrm{H}} \min =\mathrm{V}_{\mathrm{cC}} \times 0.9$, and $\mathrm{V}_{\mathrm{LL}} \max =0.3 \mathrm{~V}$.
4. $I_{c c}$ depends on $V_{c c}$ and $f$ as follows:
$\mathrm{I}_{\mathrm{cc}} \max =2.0(\mathrm{~mA})+0.67(\mathrm{~mA} /(\mathrm{MHz} \times \mathrm{V})) \times \mathrm{V}_{\mathrm{cc}} \times \mathrm{f}$ [normal mode]
$\mathrm{I}_{\mathrm{cc}} \max =2.0(\mathrm{~mA})+0.48(\mathrm{~mA} /(\mathrm{MHz} \times \mathrm{V})) \times \mathrm{V}_{\mathrm{cc}} \times \mathrm{f}$ [sleep mode]
$\mathrm{I}_{\mathrm{cc}} \max =2.0(\mathrm{~mA})+0.07(\mathrm{~mA} /(\mathrm{MHz} \times \mathrm{V})) \times \mathrm{V}_{\mathrm{cc}} \times \mathrm{f}$ [sleep, all module stop and medium speed ( $\phi / 32$ ) mode]
5. The current dissipation for $32-\mathrm{kHz}$ operation is the value when the duty adjustment circuit is stopped.

## Table 19.4 Permissible Output Currents

Conditions: $\mathrm{V}_{\mathrm{CC}}=2.7 \mathrm{~V}$ to $5.5 \mathrm{~V}, \mathrm{AV}_{\mathrm{CC}}=2.7$ to $5.5 \mathrm{~V}, \mathrm{~V}_{\mathrm{ref}}=2.7 \mathrm{~V}$ to $\mathrm{AV}_{\mathrm{CC}}, \mathrm{V}_{\mathrm{SS}}=\mathrm{AV}_{\mathrm{SS}}=0 \mathrm{~V}$, $\mathrm{T}_{\mathrm{a}}=-20$ to $+75^{\circ} \mathrm{C}$ (regular specifications), $\mathrm{Ta}=-40$ to $+85^{\circ} \mathrm{C}$ (wide-range specifications)

| Item | Symbol | Min | Typ | Max | Unit |  |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| Permissible output <br> low current (per pin) | Ports 1, A to C $\mathrm{I}_{\mathrm{OL}}$ - - 10 mA <br> Other output pins      | - | - | 2.0 | mA |  |
| Permissible output <br> low current (total) | Total of 28 pins <br> including ports 1 <br> and A to C | $\sum \mathrm{I}_{\mathrm{OL}}$ | - | - | 80 | mA |
|  | Total of all output <br> pins, including the <br> above |  | - | - | 120 | mA |
| Permissible output <br> high current (per pin) | All output pins | $-\mathrm{I}_{\mathrm{OH}}$ | - | - | 2.0 | mA |
| Permissible output <br> high current (total) | Total of all output <br> pins | $\sum-\mathrm{I}_{\mathrm{OH}}$ | - | - | 40 | mA |

Notes: 1. To protect chip reliability, do not exceed the output current values in table 19.4.
2. When driving a darlington pair or LED, always insert a current-limiting resister in the output line, as show in figures 19.1 and 19.2.

Figure 19.1 Darlington Pair Drive Circuit (Example)

Figure 19.2 LED Drive Circuit (Example)

### 19.4 AC Characteristics

Figure 19.3 show, the test conditions for the AC characteristics.

Figure 19.3 Output Load Circuit

### 19.4.1 Clock Timing

Table 19.5 lists the clock timing

## Table 19.5 Clock Timing

Condition A: $\mathrm{V}_{\mathrm{cc}}=2.7 \mathrm{~V}$ to $5.5 \mathrm{~V}, \mathrm{AV}_{\mathrm{cc}}=2.7 \mathrm{~V}$ to $5.5 \mathrm{~V}, \mathrm{~V}_{\text {ref }}=2.7 \mathrm{~V}$ to $\mathrm{AV}_{\mathrm{Cc}}$, $\mathrm{V}_{\mathrm{ss}}=\mathrm{AV}_{\mathrm{ss}}=0 \mathrm{~V}, \phi=32 \mathrm{kHz}$ to $10 \mathrm{MHz}, \mathrm{T}_{\mathrm{a}}=-20$ to $+75^{\circ} \mathrm{C}$ (regular specifications), $\mathrm{T}_{\mathrm{a}}=-40$ to $+85^{\circ} \mathrm{C}$ (wide-range specifications)

Condition B: $\mathrm{V}_{\mathrm{CC}}=2.7$ to $5.5 \mathrm{~V}, \mathrm{AV}_{\mathrm{CC}}=2.7$ to $5.5 \mathrm{~V}, \mathrm{~V}_{\mathrm{ref}}=2.7 \mathrm{~V}$ to $\mathrm{AV}_{\mathrm{CC}}$, $\mathrm{V}_{\mathrm{ss}}=\mathrm{AV}_{\mathrm{ss}}=0 \mathrm{~V}, \phi=32 \mathrm{kHz}$ to $13 \mathrm{MHz}, \mathrm{T}_{\mathrm{a}}=-20$ to $+75^{\circ} \mathrm{C}$ (regular specifications), $\mathrm{T}_{\mathrm{a}}=-40$ to $+85^{\circ} \mathrm{C}$ (wide-range specifications)

Condition C: $\mathrm{V}_{\mathrm{cC}}=5.0 \mathrm{~V} \pm 10 \%, \mathrm{AV}_{\mathrm{cC}}=5.0 \mathrm{~V} \pm 10 \%, \mathrm{~V}_{\mathrm{ref}}=4.5 \mathrm{~V}$ to $\mathrm{AV}_{\mathrm{cc}}$, $\mathrm{V}_{\mathrm{SS}}=\mathrm{AV}_{\mathrm{SS}}=0 \mathrm{~V}, \phi=2$ to $20 \mathrm{MHz}, \mathrm{T}_{\mathrm{a}}=-20$ to $+75^{\circ} \mathrm{C}$ (regular specifications), $\mathrm{T}_{\mathrm{a}}=-40$ to $+85^{\circ} \mathrm{C}$ (wide-range specifications)

### 19.4.4 Timing of On-Chip Supporting Modules

Table 19.8 lists the timing of on-chip supporting modules.

## Table 19.8 Timing of On-Chip Supporting Modules

Condition A: $\mathrm{V}_{\mathrm{CC}}=2.7 \mathrm{~V}$ to $5.5 \mathrm{~V}, \mathrm{AV}_{\mathrm{CC}}=2.7 \mathrm{~V}$ to $5.5 \mathrm{~V}, \mathrm{~V}_{\text {ref }}=2.7 \mathrm{~V}$ to $\mathrm{AV}_{\mathrm{CC}}$, $\mathrm{V}_{\mathrm{ss}}=\mathrm{AV}_{\mathrm{ss}}=0 \mathrm{~V}, \phi=32 \mathrm{kHz}$ to $10 \mathrm{MHz}(\mathrm{I} / \mathrm{O}$ port, TMR, WDT), $\phi=2$ to 10 MHz (TPU, SCI, A/D converter), $\mathrm{T}_{\mathrm{a}}=-20$ to $+75^{\circ} \mathrm{C}$ (regular specifications), $\mathrm{T}_{\mathrm{a}}=-40$ to $+85^{\circ} \mathrm{C}$ (wide-range specifications)

Condition B: $\mathrm{V}_{\mathrm{CC}}=2.7 \mathrm{~V}$ to $5.5 \mathrm{~V}, \mathrm{AV}_{\mathrm{CC}}=2.7 \mathrm{~V}$ to $5.5 \mathrm{~V}, \mathrm{~V}_{\text {ref }}=2.7 \mathrm{~V}$ to $\mathrm{AV}_{\mathrm{CC}}$, $\mathrm{V}_{\mathrm{ss}}=\mathrm{AV}_{\mathrm{ss}}=0 \mathrm{~V}, \phi=32 \mathrm{kHz}$ to 13 MHz (I/O port, TMR, WDT), $\phi=2$ to 13 MHz (TPU, SCI, A/D converter), $\mathrm{T}_{\mathrm{a}}=-20$ to $+75^{\circ} \mathrm{C}$ (regular specifications), $\mathrm{T}_{\mathrm{a}}=-40$ to $+85^{\circ} \mathrm{C}$ (wide-range specifications)

Condition C: $\mathrm{V}_{\mathrm{CC}}=5.0 \mathrm{~V} \pm 10 \%, \mathrm{AV}_{\mathrm{cC}}=5.0 \mathrm{~V} \pm 10 \%, \mathrm{~V}_{\text {re }}=4.5 \mathrm{~V}$ to $\mathrm{AV}_{\mathrm{CC}}$, $\mathrm{V}_{\mathrm{SS}}=\mathrm{AV}_{\mathrm{SS}}=0 \mathrm{~V}, \phi=2$ to $20 \mathrm{MHz}, \mathrm{T}_{\mathrm{a}}=-20$ to $+75^{\circ} \mathrm{C}$ (regular specifications), $\mathrm{T}_{\mathrm{a}}=-40$ to $+85^{\circ} \mathrm{C}$ (wide-range specifications)

| Item |  |  | Symbol | Condition A |  | Condition B |  | Condition C |  | Unit | Test Conditions |

### 19.5 A/D Conversion Characteristics

Table 19.9 lists the $\mathrm{A} / \mathrm{D}$ conversion characteristics.

## Table 19.9 A/D Conversion Characteristics

Condition A: $\mathrm{V}_{\mathrm{CC}}=2.7 \mathrm{~V}$ to $5.5 \mathrm{~V}, \mathrm{AV}_{\mathrm{CC}}=2.7 \mathrm{~V}$ to $5.5 \mathrm{~V}, \mathrm{~V}_{\text {ref }}=2.7 \mathrm{~V}$ to $\mathrm{AV}_{\mathrm{CC}}$, $\mathrm{V}_{\mathrm{SS}}=\mathrm{AV}_{\mathrm{SS}}=0 \mathrm{~V}, \phi=2$ to $10 \mathrm{MHz}, \mathrm{T}_{\mathrm{a}}=-20$ to $+75^{\circ} \mathrm{C}$ (regular specifications), $\mathrm{T}_{\mathrm{a}}=-40$ to $+85^{\circ} \mathrm{C}$ (wide-range specifications)

Condition B: $\mathrm{V}_{\mathrm{CC}}=2.7 \mathrm{~V}$ to $5.5 \mathrm{~V}, \mathrm{AV}_{\mathrm{cC}}=2.7 \mathrm{~V}$ to $5.5 \mathrm{~V}, \mathrm{~V}_{\text {ref }}=2.7 \mathrm{~V}$ to $\mathrm{AV}_{\mathrm{cc}}$,
$\mathrm{V}_{\mathrm{SS}}=\mathrm{AV}_{\mathrm{SS}}=0 \mathrm{~V}, \phi=2$ to $13 \mathrm{MHz}, \mathrm{T}_{\mathrm{a}}=-20$ to $+75^{\circ} \mathrm{C}$ (regular specifications), $\mathrm{T}_{\mathrm{a}}=-40$ to $+85^{\circ} \mathrm{C}$ (wide-range specifications)

Condition C: $\mathrm{V}_{\mathrm{cC}}=5.0 \mathrm{~V} \pm 10 \%, \mathrm{AV}_{\mathrm{cC}}=5.0 \mathrm{~V} \pm 10 \%, \mathrm{~V}_{\text {ref }}=4.5 \mathrm{~V}$ to $\mathrm{AV}_{\mathrm{c}}$, $\mathrm{V}_{\mathrm{SS}}=\mathrm{AV}_{\mathrm{SS}}=0 \mathrm{~V}, \phi=2$ to $20 \mathrm{MHz}, \mathrm{T}_{\mathrm{a}}=-20$ to $+75^{\circ} \mathrm{C}$ (regular specifications), $\mathrm{T}_{\mathrm{a}}=-40$ to $+85^{\circ} \mathrm{C}$ (wide-range specifications)

| Item | Condition A |  |  | Condition B |  |  | Condition C |  |  | Unit |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | Min | Typ | Max | Min | Typ | Max | Min | Typ | Max |  |
| Resolution | 10 | 10 | 10 | 10 | 10 | 10 | 10 | 10 | 10 | bits |
| Conversion time | 13.1 | - | - | 9.8 | - | - | 6.5 | - | - | $\mu \mathrm{s}$ |
| Analog input capacitance | - | - | 20 | - | - | 20 | - | - | 20 | pF |
| Permissible signalsource impedance | - | - | 10*1 | - | - | 10*1 | - | - | $10{ }^{3}$ | $k \Omega$ |
|  | - | - | $5 *^{2}$ | - | - | $5 *^{2}$ | - | - | $5{ }^{*}$ |  |
| Nonlinearity error | - | - | $\pm 6.0$ | - | - | $\pm 6.0$ | - | - | $\pm 3.0$ | LSB |
| Offset error | - | - | $\pm 4.0$ | - | - | $\pm 4.0$ | - | - | $\pm 2.0$ | LSB |
| Full-scale error | - | - | $\pm 4.0$ | - | - | $\pm 4.0$ | - | - | $\pm 2.0$ | LSB |
| Quantization error | - | - | $\pm 0.5$ | - | - | $\pm 0.5$ | - | - | $\pm 0.5$ | LSB |
| Absolute accuracy | - | - | $\pm 8.0$ | - | - | $\pm 8.0$ | - | - | $\pm 4.0$ | LSB |

Notes: 1. $4.0 \leq \mathrm{AV}_{\mathrm{cc}} \leq 5.5 \mathrm{~V}$
2. $2.7 \mathrm{~V} \leq \mathrm{AV}_{\mathrm{cc}}<4.0 \mathrm{~V}$
3. $\phi \leq 12 \mathrm{MHz}$
4. $\phi>12 \mathrm{MHz}$

### 19.6 Usage Notes

Although both the ZTAT and mask ROM versions fully meet the electrical specifications listed in this manual, due to differences in the fabrication process, the on-chip ROM, and the layout patterns, there will be differences in the actual values of the electrical characteristics, the operating margins, the noise margins, and other aspects.

Therefore, if a system is evaluated using the ZTAT version, a similar evaluation should also be performed using the mask ROM version.

## Appendix A Instruction Set

## A. 1 Instruction List

## Operand Notation

| Rd | General register (destination)* |
| :---: | :---: |
| Rs | General register (source)* |
| Rn | General register* |
| ERn | General register (32-bit register) |
| (EAd) | Destination operand |
| (EAs) | Source operand |
| EXR | Extended control register |
| CCR | Condition-code register |
| N | $N$ (negative) flag in CCR |
| Z | Z (zero) flag in CCR |
| V | $V$ (overflow) flag in CCR |
| C | C (carry) flag in CCR |
| PC | Program counter |
| SP | Stack pointer |
| \#IMM | Immediate data |
| disp | Displacement |
| + | Add |
| - | Subtract |
| $\times$ | Multiply |
| $\div$ | Divide |
| $\wedge$ | Logical AND |
| $\checkmark$ | Logical OR |
| $\oplus$ | Logical exclusive OR |
| $\rightarrow$ | Move |
| $\neg$ | Logical NOT (logical complement) |
| ( ) < > | Contents of effective address of the operand |
| :8/:16/:24/:32 | 8-, 16-, 24-, or 32-bit length |

Note: * General registers include 8-bit registers (R0H to R7H, R0L to R7L), 16-bit registers (R0 to R7, E0 to E7), and 32-bit registers (ER0 to ER7).

## Condition Code Notation

| Symbol |  |
| :--- | :--- |
| $\mathfrak{\downarrow}$ | Changes according to the result of instruction |
| $*$ | Undetermined (no guaranteed value) |
| 0 | Always cleared to 0 |
| 1 | Always set to 1 |
| - | Not affected by execution of the instruction |

## A. 3 Number of States Required for Instruction Execution

The tables in this section can be used to calculate the number of states required for instruction execution by the H8S/2000 CPU. Table A. 4 indicates the number of instruction fetch, data read/write, and other cycles occurring in each instruction. Table A. 3 indicates the number of states required for each cycle, depending on its size. The number of states required for execution of an instruction can be calculated from these two tables as follows:

Execution states $=I \times S_{I}+J \times S_{J}+K \times S_{K}+L \times S_{L}+M \times S_{M}+N \times S_{N}$
Examples: Advanced mode, program code and stack located in external memory, on-chip supporting modules accessed in two states with 8-bit bus width, external devices accessed in three states with one wait state and 16-bit bus width.

1. BSET \#0, @FFFFC7:8

From table A.4:

$$
\mathrm{I}=\mathrm{L}=2, \quad \mathrm{~J}=\mathrm{K}=\mathrm{M}=\mathrm{N}=0
$$

From table A.3:

$$
\mathrm{S}_{\mathrm{I}}=4, \quad \mathrm{~S}_{\mathrm{L}}=2
$$

Number of states required for execution $=2 \times 4+2 \times 2=12$
2. JSR @ @ 30

From table A.4:

$$
\mathrm{I}=\mathrm{J}=\mathrm{K}=2, \quad \mathrm{~L}=\mathrm{M}=\mathrm{N}=0
$$

From table A.3:

$$
S_{\mathrm{I}}=\mathrm{S}_{\mathrm{J}}=\mathrm{S}_{\mathrm{K}}=4
$$

Number of states required for execution $=2 \times 4+2 \times 4+2 \times 4=24$

Table A. 3 Number of States per Cycle
Access Conditions

|  |  | On-Chip Memory | On-Chip Supporting Module |  | External Device |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

Notes: 1. 2 when EXR is invalid, 3 when EXR is valid.
2. When $n$ bytes of data are transferred.
3. Only register ERO to ER6 should be used when using the STM/LDM instruction.
4. Only register ER0, ER1, ER4, or ER5 should be used when using the TAS instruction.

Note: * Located in on-chip RAM. The bus width is 32 bits when the DTC accesses this area as register information, and 16 bits otherwise.

## B. 2 Register Descriptions

MRA—DTC Mode Register A
H'F800—H'FBFF
DTC

Bit :

| 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| SM1 | SM0 | DM1 | DM0 | MD1 | MD0 | DTS | Sz |

Initial value :
Undefined Undefined Undefined Undefined Undefined Undefined Undefined Undefined
Read/Write :

Destination Address Mode

| 0 | - | DAR is fixed |
| :---: | :---: | :--- |
| 1 | 0 | DAR is incremented after a transfer <br> $(b y+1$ when $\mathrm{Sz}=0 ;$ by +2 when $\mathrm{Sz}=1)$ |
|  | 1 | DAR is decremented after a transfer <br> $(b y-1$ when $\mathrm{Sz}=0 ;$ by -2 when $\mathrm{Sz}=1)$ |

Source Address Mode

| 0 | - | SAR is fixed |
| :---: | :---: | :--- |
| 1 | 0 | SAR is incremented after a transfer <br> $(b y+1$ when $S z=0 ;$ by +2 when $\mathrm{Sz}=1)$ |
|  | 1 | SAR is decremented after a transfer <br> $(b y-1$ when $\mathrm{Sz}=0 ;$ by -2 when $\mathrm{Sz}=1)$ |

Bit

Initial value : Undefined Undefined Undefined Undefined Undefined Undefined Undefined Undefined
Read/Write :

Specifies transfer data source address

Specifies transfer data destination address

CRA—DTC Transfer Count Register A

Initial value : Unde- Unde- Unde- Unde- Unde- Unde- Unde- Unde- Unde- Unde- Unde- Unde- Unde- Unde- Unde- Unde-
fined fined fined fined fined fined fined fined fined fined fined fined fined fined fined fined

Specifies the number of DTC data transfers

## CRB—DTC Transfer Count Register B

H'F800-H'FBFF

Initial value : Unde- Unde- Unde- Unde- Unde- Unde- Unde- Unde- Unde- Unde- Unde- Unde- Unde- Unde- Unde- Undefined fined fined fined fined fined fined fined fined fined fined fined fined fined fined fined
Read/Write : $\qquad$

Specifies the number of DTC block data transfers

| P1DDR-Port | Data Dir | ection Reg | egister |  | 'FEB0 |  |  | Port 1 |

| Initial value | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |

$\begin{array}{llllllllll}\text { Read/Write: } & \underline{R /(W)} \\ & & R /(W))^{* 2} & \mathrm{R} /(\mathrm{W})^{* 2} & \mathrm{R} /(\mathrm{W})^{* 2} & \mathrm{R} /(\mathrm{W})^{* 2} & \mathrm{R} /(\mathrm{W})^{* 2} & \mathrm{R} /(\mathrm{W})^{* 2} & \mathrm{R} /(\mathrm{W})^{* 2}\end{array}$
Sets vector number for DTC software activation

## DTC Software Activation Enable

| 0 | DTC software activation is disabled <br> [Clearing conditions] <br> - When the DISEL bit is 0 and the specified number of transfers have not ended <br> - When 0 is written to the DISEL bit after a software-activated data transfer end <br> interrupt (SWDTEND) request has been sent to the CPU. |
| :---: | :--- |
| 1 | DTC software activation is enabled <br> [Holding conditions] <br> - When the DISEL bit is 1 and data transfer has ended <br> - When the specified number of transfers have ended <br> - During data transfer activated by software |

Notes: 1. A value of 1 can always be written to the SWDTE bit, but 0 can only be written after 1 is read.
2. Only write to bits DTVEC6 to DTVEC0 when SWDTE is 0 .

SBYCR—Standby Control Register
H'FF38

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

| Initial value | 1 | 0 | 0 | 0 | 0 | 1 | 0 | 0 |

Read/Write : $\frac{\mathrm{R} /(\mathrm{W})^{* 1}}{\square} \frac{\mathrm{R} /(\mathrm{W})^{* 1}}{\square} \frac{\mathrm{R} /(\mathrm{W})^{* 1}}{\mathrm{R} /(\mathrm{W})^{* 1}} \quad \frac{\mathrm{R} /(\mathrm{W})^{* 1}}{\square} \quad \frac{\mathrm{R}}{\square} \quad \frac{\mathrm{R}}{\square} \quad \frac{\mathrm{R} / \mathrm{W}}{\square}$
Multiprocessor Bit Transfer

| 0 | Data with a 0 multiprocessor bit is transmitted |
| :--- | :--- |
| 1 |  |

1 Data with a 1 multiprocessor bit is transmitted

## Multiprocessor Bit

| 0 | [Clearing condition] <br> When data with a 0 multiprocessor bit is received |
| :---: | :--- |
| 1 | [Setting condition] <br> When data with a 1 multiprocessor bit is received |

## Transmit End

| 0 | [Clearing conditions] <br> - When 0 is written to TDRE after reading TDRE $=1$ <br> - When the DTC*2 is activated by a TXI interrupt and write data to TDR |
| :--- | :--- |
| 1 | [Setting conditions] <br> - When the TE bit in SCR is 0 <br> - When TDRE $=1$ at transmission of the last bit of a 1 -byte <br> serial transmit character |

Parity Error
0 [Clearing condition]
When 0 is written to FER after reading FER = 1
[Setting condition]
When, in reception, the number of 1 bits in the receive data plus the parity bit does not match the parity setting (even or odd) specified by the O/E bit in SMR
Framing Error

| 0 | [Clearing condition] <br> When 0 is written to FER after reading FER $=1$ |
| :--- | :--- |
| 1 | [Setting condition] <br> When the SCI checks whether the stop bit at the end of the receive <br> data is 1 when reception ends, and the stop bit is 0 |

## Overrun Error

| 0 | $[$ Clearing condition] <br> When 0 is written to ORER after reading ORER $=1$ |
| :--- | :--- |
| 1 | $[$ Setting condition $]$ <br> When the next serial reception is completed while <br> RDRF $=1$ |

Receive Data Register Full
0 [Clearing conditions]

- When 0 is written to RDRF after reading RDRF $=1$
- When the DTC*2 is activated by an RXI interrupt and read data from RDR

1 [Setting condition]
When serial reception ends normally and receive data is transferred from RSR to RDR

Transmit Data Register Empty
0 [Clearing conditions]

- When 0 is written to TDRE after reading TDRE $=1$
- When the DTC*2 is activated by a TXI interrupt and write data to TDR

1 [Setting conditions]

- When the TE bit in SCR is 0
- When data is transferred from TDR to TSR and data can be written to TDR

Notes: 1. Can only be written with 0 for flag clearing.
2. DTC can clear this bit only when DISEL is 0 with the transfer counter not being 0 .

## SSR2—Serial Status Register 2

H'FF8C

## Smart Card Interface 2

Notes: 1. Can only be written with 0 for flag clearing
2. DTC can clear this bit only when DISEL is 0 with the transfer counter not being 0 .

Read/Write : R/W R/W R/W R/W R/W R/W R/W R/W R/W R/W R/W R/W R/W R/W R/W R/W

Timer Enable starts counting up from $\mathrm{H}^{\prime} \mathrm{OO}$ until overflow occurs.

| 0 | TCNT is initialized to H'00 and halted |
| :--- | :--- |
| 1 | TCNT counts |

Timer Mode Select

| 0 | Interval timer mode: Sends the CPU an interval timer interrupt request <br> (WOVI) when TCNT overflows |
| :---: | :--- |
| 1 | Watchdog timer mode: Generates the $\overline{\text { WDTOVF signal when }}$ <br> TCNT overflows |

Overflow Flag

| 0 | [Clearing condition] <br> Cleared by reading TCSR when OVF $=1$, then writing 0 to $\mathrm{OVF}^{* 2}$ |
| :---: | :--- |
| 1 | [Setting condition] <br> Set when TCNT overflows from H'FF to H'00 in interval timer mode |

Notes: The method for writing to TCSR is different from that for general registers to prevent accidental overwriting.
For details see section 11.2.4, Notes on Register Access.

1. Can only be written with 0 for flag clearing.
2. When polling OVF with the interval timer interrupt disabled, read TSCR twice or more while OVF is set to 1 .

## TCNT—Timer Counter

Note: The method for writing to TCNT is different from that for general registers to prevent accidental overwriting. For details see section 11.2.4, Notes on Register Access.

Notes: The method for writing to RSTCSR is different from that for general registers to prevent accidental overwriting. For details see section 11.2.4, Notes on Register Access.

* Can only be written with 0 for flag clearing.

| Bit | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | - | - | - | - | CST2 | CST1 | CST0 |
| Initial value : | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| Read/Write : | - | - | - | - | - | R/W | R/W | R/W |
|  |  |  |  |  | Counter Start |  |  |  |
|  |  |  |  |  | 0 | $\mathrm{TCNT}_{\mathrm{n}}$ cour | t opera | is stopped |
|  |  |  |  |  | 1 | $\mathrm{TCNT}_{\mathrm{n}}$ pe | rms co | operation |

Note: $\mathrm{n}=2$ to 0

Note: If 0 is written to the CST bit during operation with the TIOC pin designated for output, the counter stops but the TIOC pin output compare output level is retained. If TIOR is written to when the CST bit is cleared to 0 , the pin output level will be changed to the set initial output value.

TSYR—Timer Synchro Register

## TSR0—Timer Status Register 0

H'FFD5

Bit
Initial value :

TGRA•Input Capture/Output Compare Flag

| 0 | [Clearing conditions] |
| :---: | :--- |

- When DTC* ${ }^{* 2}$ is activated by TGIA interrupt while DISEL bit of MRB in DTC is 0 .
- When 0 is written to TGFA after reading TGFA $=1$
1 [Setting conditions]
- When TCNT = TGRA while TGRA is functioning as output compare register
- When TCNT value is transferred to TGRA by input capture signal while TGRA is functioning as input capture register
TGRB.Input Capture/Output Compare Flag

| 0 | [Clearing conditions] <br> - When DTC*2 is activated by TGIB interrupt while DISEL <br> bit of MRB in DTC is 0. |
| :---: | :--- |
| 1 | - When 0 is written to TGFB after reading TGFB $=1$ |
| - When TCNT $=$ TGRB while TGRB is functioning as <br> output compare register <br> - When TCNT value is transferred to TGRB by input <br> capture signal while TGRB is functioning as input <br> capture register |  |

TGRC•Input Capture/Output Compare Flag
0 [Clearing conditions]

- When DTC ${ }^{* 2}$ is activated by TGIC interrupt while DISEL bit of MRB in DTC is 0
- When 0 is written to TGFC after reading TGFC $=1$

1 [Setting conditions]

- When TCNT = TGRC while TGRC is functioning as output compare register
- When TCNT value is transferred to TGRC by input capture signal while TGRC is functioning as input capture register

TGRD.Input Capture/Output Compare Flag

| 0 | [Clearing conditions] <br> - When DTC*2 is activated by TGID interrupt while DISEL bit of MRB in DTC <br> - is 0 |
| :---: | :--- |
| 1 | When 0 is written to TGFD after reading TGFD $=1$ |
| Setting conditions] |  |
| - When TCNT $=$ TGRD while TGRD is functioning as output compare register |  |
| - When TCNT value is transferred to TGRD by input capture signal while |  |
| TGRD is functioning as input capture register |  |

Overflow Flag

| 0 | Clearing condition] <br> When 0 is written to TCFV after reading TCFV $=1$ |
| :---: | :--- |
| 1 | $[$ Setting condition $]$ <br> When the TCNT value overflows (changes from H'FFFF to H'0000 ) |

Notes: 1. Can only be written with 0 for flag clearing.
2. DTC can clear this bit only when DISEL is 0 with the transfer counter not being 0 .

## Appendix E Pin States at Power-On

Note that pin states at power-on depend on the state of the $\overline{\text { STBY }}$ pin and NMI pin. The case in which pins settle* from an indeterminate state at power-on, and the case in which pins settle* from the high-impedance state, are described below.

After reset release, power-on reset exception handling is started.
Note: * "Settle" refers to the pin states in a power-on reset in each MCU operating mode.

## E. 1 When Pins Settle from an Indeterminate State at Power-On

When the NMI pin level changes from low to high after powering on, the chip goes to the poweron reset state after a high level is detected at the NMI pin. While the chip detects a low level at the NMI pin, the manual reset state is established. The pin states are indeterminate during this interval. (Ports may output an internally determined value after powering on.)

The NMI setup time $\left(\mathrm{t}_{\text {NMIS }}\right)$ is necessary for the chip to detect a high level at the NMI pin.

Figure E. 1 When Pins Settle from an Indeterminate State at Power-On

## E. 2 When Pins Settle from the High-Impedance State at Power-On

When the $\overline{\text { STBY }}$ pin level changes from low to high after powering on, the chip goes to the poweron reset state after a high level is detected at the $\overline{\text { STBY }}$ pin. While the chip detects a low level at the $\overline{\text { STBY }}$ pin, it is in the hardware standby mode. During this interval, the pins are in the highimpedance state.

After detecting a high level at the $\overline{\text { STBY }}$ pin, the chip starts oscillation.

Figure E. 2 When Pins Settle from the High-Impedance State at Power-On

## Appendix F Timing of Transition to and Recovery from Hardware Standby Mode

## Timing of Transition to Hardware Standby Mode

(1) To retain RAM contents with the RAME bit set to 1 in SYSCR, drive the $\overline{\operatorname{RES}}$ signal low at least 10 states before the $\overline{\text { STBY }}$ signal goes low, as shown figure F.1. $\overline{\text { RES }}$ must remain low until $\overline{\text { STBY }}$ goes low (delay from $\overline{\text { STBY }}$ fall to $\overline{\mathrm{RES}}$ rise: minimum 0 ns ).
$\overline{S T B Y}$
$\overline{\text { RES }}$

## Figure F. 1 Timing of Transition to Hardware Standby Mode

(2) To retain RAM contents with the RAME bit cleared to 0 in SYSCR, or when RAM contents do not need to be retained, $\overline{\text { RES }}$ does not have to be driven low as in (1).

## Timing of Recovery from Hardware Standby Mode

Drive the $\overline{\mathrm{RES}}$ signal low and the NMI signal high approximately 100 ns or more before $\overline{\mathrm{STBY}}$ goes high, and execute a power-on reset.

Figure F. 2 Timing of Recovery from Hardware Standby Mode

## Appendix G Product Code Lineup

## Appendix H Package Dimensions

The package dimension that is shown in the Renesas Semiconductor Package Data Book has priority.
