

28V, 1A Single Cell Li-Ion & Li-Pol Linear Battery Charger

General Description

The DS6521 series of devices are highly integrated Li-Ion and Li-Pol linear chargers devices targeted at space-limited portable applications.

The battery is charged in three phases: conditioning, constant current and constant voltage. In all charge phases, an internal control loop monitors the IC junction temperature and reduces the charge current if an internal temperature threshold is exceeded.

The charger power stage and charge current sense functions are fully integrated. The charger function has high accuracy current and voltage regulation loops, charge status display, and charge termination.

The fast charge current value is also programmable via an external resistor.

Features

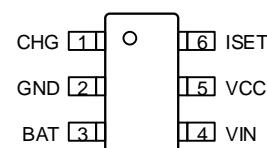

- 28V Input Rating; with 6V Input Overvoltage Protection
- 1% Charge Voltage Accuracy
- Programmable Charger Current 50mA to 1A
- 125°C Thermal Regulation
- Programmable Termination Charge Current 5mA to 100mA
- Fixed ISET / 10 for Pre-Charge Current
- Operation over JEITA Range via Battery NTC – 1/2 Fast-Charge-Current at Cold, and 4.05V at Hot
- Very Low Battery leakage Current 0.1uA
- Prevent Battery Reverse Connection Function
- SOT-23-5 & ESOP-8 & DFN2x2-10L & DFN2x3-10L & DFN3x3-10L Package Available

Applications

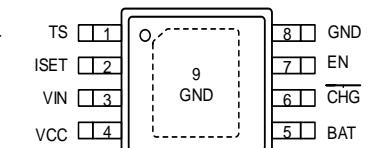

- Laptop, Palmtops and PDAs
- Smart Phones
- MP3 Players
- Low-Power Handheld Devices

Pin Configurations

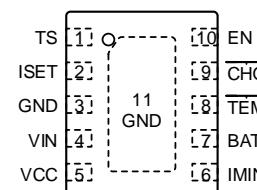

SOT-23-6

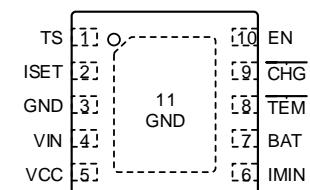

ESOP-8

DFN2x2-10L & DFN2x3-10L

DFN3x3-10L

Ordering Information

DS6521XTYY

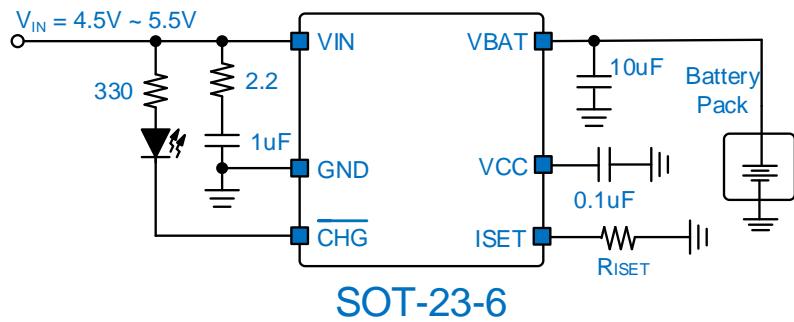

| Designator | Description | Symbol | Description |
|------------|--------------|--------|-------------|
| X | V_{BAT} | A | 4.2V |
| | | B | 4.35V |
| T | TSM | F | 0°C & 45°C |
| | | J | JEITA |
| YY | Package type | S6 | SOT-23-6 |
| | | F8 | ESOP-8L |
| | | D22 | DFN2x2-10L |
| | | D23 | DFN2x3-10L |
| | | D33 | DFN3x3-10L |

Example : $V_{BAT} = 4.2V$, TSM = 0°C & 45°C , DFN2x2-10L. Part no = DS6521AFD22 .

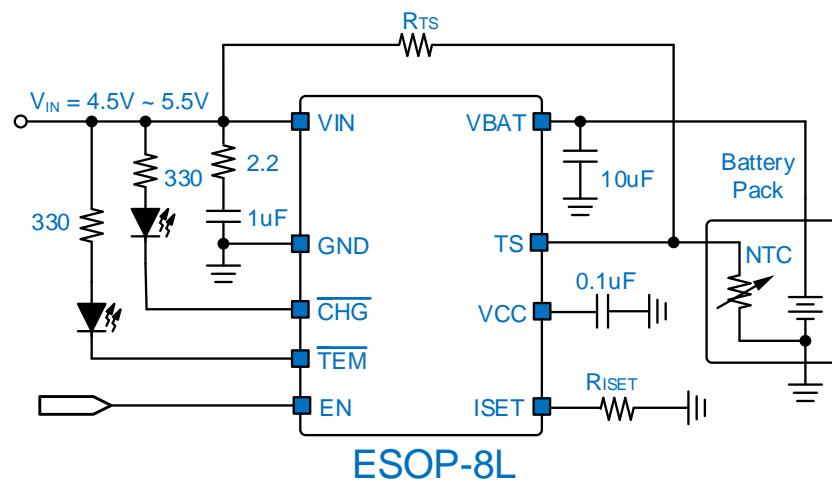

Description of Functional Pins

| Pin No | | | Pin Name | Pin Function |
|-------------|-------------|---------|----------|--|
| DFN2x2-10L | ESOP-8 | SOT23-5 | | |
| 1 | 1 | | TS | Temperature sense terminal connected to 10K & 100K at 25°C NTC thermistor, in the battery pack. |
| 2 | 2 | 5 | ISET | Programs the Fast Charge Current Setting. External resistor from ISET to GND defines fast charge current value. |
| 3 | 8 | 2 | GND | Ground . |
| 4 | 3 | 4 | VIN | Input of Supply Voltage . |
| 5 | 4 | | VCC | Internal regulator output, it is recommended to connect an external 0.1uF ~ 1uF capacitor to ground . |
| 6 | | | IMIN | Programs the Termination Charge Current Setting. External resistor from IMIN to GND defines the value of termination charge current. |
| 7 | 5 | 3 | BAT | Battery Connection. System Load may be connected. Expected range of bypass capacitors 10μF to 22μF. |
| 8 | 6 | 1 | CHG | Low (FET on) indicates charging and Open Drain (FET off) indicates no Charging or Charge complete. |
| 9 | | | TEM | Low (FET on) means that the charging current is less than the Termination Current, and open drain (FET off) means that the charging current is greater than the Termination Current. |
| 10 | 7 | | EN | CHIP Enable . |
| Exposed Pad | Exposed Pad | | PGND | Substrate of Chip. Leave floating or tie to GND. |

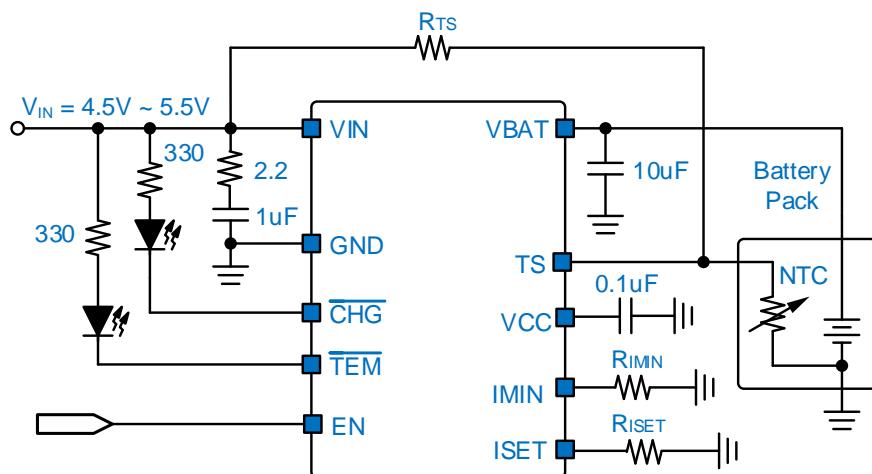

Typical Application Circuits

SOT-23-6

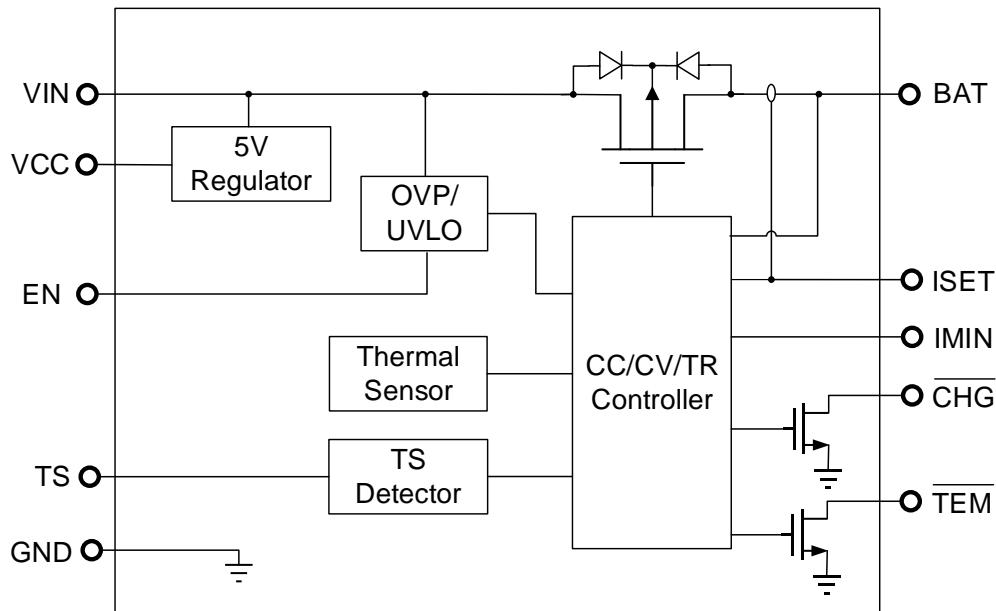

ESOP-8L

DFN2x2-10L & DFN2x3-10L & DFN3x3-10L

Function Block Diagram

Absolute Maximum Ratings (Note 1)

| | |
|-----------------------------------|--------------|
| VIN / EN / CHG / TEM to GND ----- | -0.3V to 28V |
| BAT to GND ----- | -0.3V to 15V |
| Other to GND ----- | -0.3V to 6V |

Package Thermal Resistance (Note 2)

| | |
|---|------------------|
| SOT-23-5, θ_{JA} ----- | 200 °C / W |
| ESOP-8 , θ_{JA} ----- | 75 °C / W |
| DFN2x2-10L, θ_{JA} ----- | 95 °C / W |
| DFN2x3-10L, θ_{JA} ----- | 85 °C / W |
| DFN3x3-10L, θ_{JA} ----- | 70 °C / W |
| Lead Temperature (Soldering, 10 sec.) ----- | 260 °C |
| Junction Temperature ----- | 150 °C |
| Storage Temperature Range ----- | -60 °C to 150 °C |
| ESD Susceptibility | |
| HBM ----- | 2KV |
| MM ----- | 200V |

Recommended Operating Conditions

| | |
|----------------------------------|------------------|
| Input Voltage VIN ----- | 4.5V to 24V |
| Junction Temperature Range ----- | -40 °C to 125 °C |
| Ambient Temperature Range ----- | -40 °C to 85 °C |

Electrical Characteristics

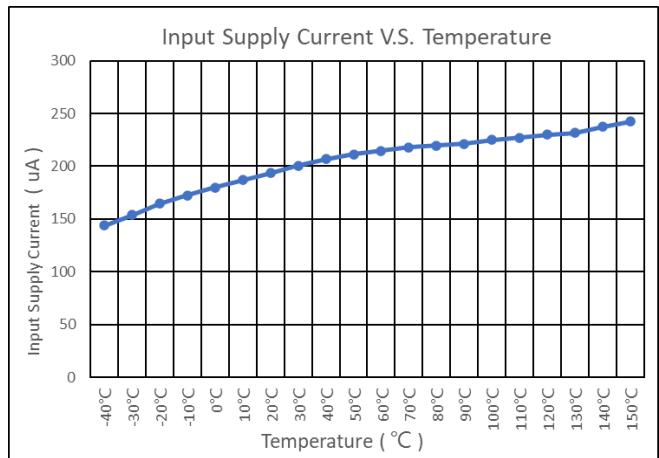

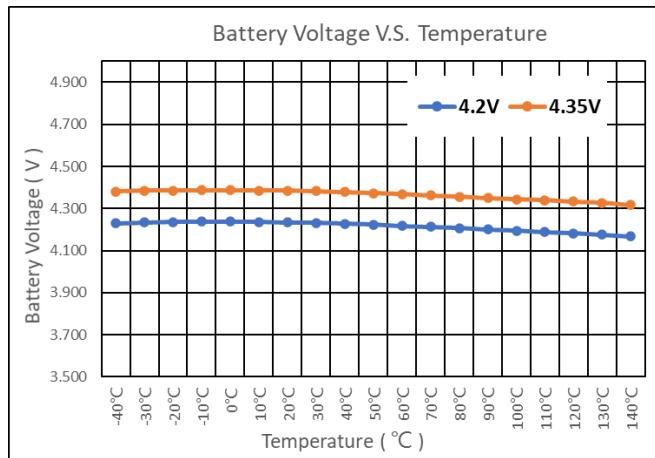

($V_{IN} = 5V$, $T_A = 25^\circ C$ unless otherwise specified)

| Parameter | Symbol | Test Conditions | Min | Typ | Max | Unit |
|--|---------------------------|--|------|-------|------|------------|
| Supply Voltage | V_{IN} | | 4.5 | -- | 24 | V |
| UVLO Threshold Voltage | V_{IN_UVLO} | V_{IN} Rising | -- | 4.5 | -- | V |
| UVLO Hysteresis Voltage | V_{UVLO_HYS} | V_{IN} Falling | -- | 4.0 | -- | V |
| Input Over-Voltage Protection | V_{OVP} | V_{IN} Rising | | 6.0 | | V |
| Input Over-Voltage Protection Hysteresis | V_{OVP_HYS} | | | 0.2 | | V |
| Input Supply Current (Charge mode) | I_{QA} | $EN = \text{High}$, $V_{IN} = 5V$, no load on OUT terminal, | | 230 | | μA |
| Input Standby Current | I_{QS} | $EN = 0V$, $V_{IN} = 5V$ | | 56 | | μA |
| Battery leakage current into BAT terminal | I_{BAT} | $V_{IN} = 0V$, $V_{BAT} = 4.2V$ | -- | 0.1 | -- | μA |
| Reverse Battery Current into BAT terminal | I_{RBAT} | $V_{BAT} = -4.2V$ | | 800 | | μA |
| Enable Threshold Voltage | V_{IH} | EN Rising | 1.5 | | | V |
| | V_{IL} | EN Falling | | | 0.4 | |
| EN Input Current | I_{EN} | $V_{EN} = 5V$ | | 10 | 100 | nA |
| Battery Regulation Voltage | $V_{BAT} / \text{Type A}$ | $I_{CHG} = 25mA$ | 4.16 | 4.2 | 4.24 | V |
| | $V_{BAT} / \text{Type B}$ | | 4.31 | 4.35 | 4.39 | |
| Recharger Battery Voltage | $V_{BAT} / \text{Type A}$ | CHG Low to Open | | 4.0 | | V |
| | $V_{BAT} / \text{Type B}$ | | | 4.125 | | |
| Fast-Charger Current | I_{CHG} | $R_{ISET} = K\Omega$ | 50 | | 1000 | mA |
| Pre-Charger Current | I_{PRE} | Percentage of I_{CHG} | | 10 | | % |
| Termination Charger Current | I_{MIN} | $R_{IMIN} = K\Omega$ | 5 | | 100 | mA |
| Termination Delay Time | T_{TEM} | I_{MIN} to CHG | | 16.7 | | mS |
| Pre-charge to Fast-charge transition threshold | V_{LOWV} | V_{BAT} Rising | -- | 2.8 | -- | V |
| Fast-charge to Pre-charge transition threshold | V_{HOWV} | V_{BAT} Falling | -- | 2.5 | -- | V |
| Low temperature CHG Pending | $V_{TS-0^\circ C}$ | Percentage of V_{IN} | -- | 75 | -- | % |
| Hysteresis at $0^\circ C$ | $V_{HYS-0^\circ C}$ | | -- | 1 | -- | % |
| Low temperature, half charge | $V_{TS-10^\circ C}$ | Percentage of V_{IN} | -- | 67 | -- | % |
| Hysteresis at $10^\circ C$ | $V_{HYS-10^\circ C}$ | | -- | 1 | -- | % |
| High temperature at 4.1V | $V_{TS-45^\circ C}$ | Percentage of V_{IN} | -- | 35 | -- | % |
| Hysteresis at $45^\circ C$ | $V_{HYS-45^\circ C}$ | | -- | 1 | -- | % |
| High temperature Disable | $V_{TS-60^\circ C}$ | Percentage of V_{IN} | -- | 25 | -- | % |
| Hysteresis at $60^\circ C$ | $V_{HYS-60^\circ C}$ | | -- | 1 | -- | % |
| Temperature regulation limit | $T_{J(REG)}$ | | | 125 | | $^\circ C$ |
| Thermal shutdown temperature | T_{J_OFF} | | | 155 | | $^\circ C$ |

Note 1. Stresses beyond those listed “Absolute Maximum Ratings” may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions may affect device reliability.

Note 2. θ_{JA} is measured at $T_A = 25^\circ\text{C}$ on a DSTECH EVB board.

Typical Characteristics

Power-Down or Undervoltage Lockout (UVLO)

The DS6521 is in power down mode if the VIN terminal voltage is less than UVLO. The part is considered "dead" and all the terminals are high impedance. Once the VIN voltage rises above the UVLO threshold the IC will enter Active mode.

Power-up

The IC is alive after the VIN voltage ramps above UVLO, resets all logic, and starts to perform many of the continuous monitoring routines. Typically, the input voltage quickly rises through the UVLO and declares power good.

Over-Voltage Protection (OVP)

If the input source applies an overvoltage, the pass FET, if previously on, turns off after a deglitch (OVP). The CHG and TEM terminal goes to a high impedance state. Once the overvoltage returns to a normal voltage, charge continues and the CHG terminal goes low after a deglitch period.

Program the Termination Charge Current , IMIN

$$I_{TEM} = K_T * (1 / R_{IMIN})$$

From the Electrical Characteristics table:

- $K_T = 605$
- $R_{IMIN} = 605 * (1 / 50mA) = 12.1 \text{ k}\Omega$

Selecting the closest standard value, use a 12.1 kΩ resistor between IMIN and GND to have $I_{TEM}=50\text{mA}$.

When the IMIN Pin floats :

$$I_{TEM} = 1/10 * I_{CHG}$$

Program the Fast Charge Current , ISET

$$I_{CHG} = V_{ISET} / R_{ISET} * 1000$$

From the Electrical Characteristics table:

- $V_{ISET} = 1V$
- $R_{ISET} = 1V / 1A * 1000 = 1.0 \text{ k}\Omega$

Selecting the closest standard value, use a 1.0 kΩ resistor between ISET and GND to have $I_{CHG}=1\text{A}$.

When using I_{MIN} setting :

$$I_{CHG} = K_C * (1 / R_{ISET}) + 0.92 * I_{TEM}$$

From the Electrical Characteristics table:

- $K_C = 924.7$
- $I_{TEM} = 50\text{mA}$
- $R_{ISET} = 924.7 / (1000\text{mA} - 0.92 * 50\text{mA})$
 $= 0.969 \text{ k}\Omega$

Selecting the closest standard value, use a 976 Ω resistor between ISET and GND to have $I_{CHG}=1\text{A}$ with $I_{TEM}=50\text{mA}$.

CHG and TEM LED Pull-up Source

For host monitoring, a pull-up resistor is used between the "STATUS" terminal and the VCC of the host and for a visual indication a resistor in series with an LED is connected between the "STATUS" terminal and a power source. If the source is the BAT terminal, note that as the battery changes voltage, and the brightness of the LEDs vary.

| Charging State | <u>CHG</u> FET/LED |
|--------------------------|--------------------|
| Charge after VIN applied | ON |
| OVP or UVLO | OFF |

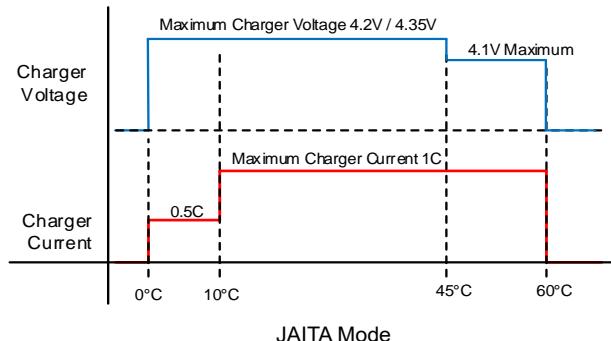

| Termination Charger Current State | $\overline{\text{TEM}}$ FET/LED |
|---|---------------------------------|
| I_{CHG} more than the I_{TEM} | OFF |
| I_{CHG} Less than I_{TEM} | ON |

Temperature Sense Type select (TSM)

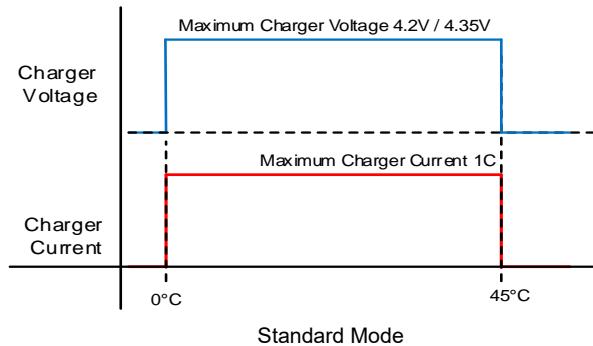

This is the temperature detection mode selection function. When the TSM is F type, the temperature detection is the standard mode, and when the TSM is J type, the temperature detection is the JEITA specification mode.

Temperature Sense (TS)

The TS function for the DS6521 is designed to follow the new JEITA temperature standard for Li-Ion and Li-Pol batteries. There are now four thresholds, 60°C, 45°C, 10°C, and 0°C. Normal operation occurs between 10°C and 45°C. If between 0°C and 10°C the charge current level is cut in half and if between 45°C and 60°C the regulation voltage is reduced to 4.1Vmax.

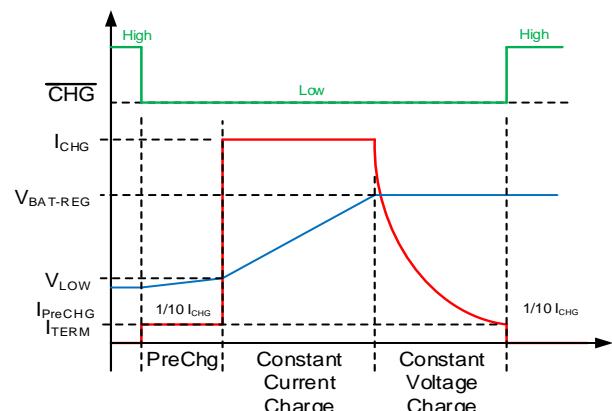

The TS function of DS6521 is designed to comply with the new temperature protection of lithium-ion and lithium polymer battery temperature standards. There are now two thresholds, 45°C and 0°C. Normal operation occurs between 0°C and 45°C.

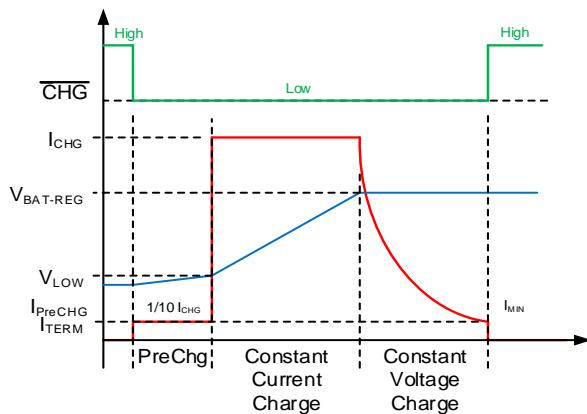

The TS feature is implemented using RTS form VIN Series with the thermistor (designed for use with a 10K NTC $\beta = 3380$) connected from the TS terminal to GND. If this feature is not needed, connecting TS and GND direct to allow normal operation without temperature sense function.

Charge Cycle

I_{MIN} Pin Floating Type :

I_{MIN} Pin Pull Down by Resistor Type :

$T_A=25^\circ\text{C}$, DSTECH PCB,

The max PD(Max) = $(125^\circ\text{C} - 25^\circ\text{C}) / (200^\circ\text{C/W}) = 0.5\text{W}$ for SOT-23-5 packages.

The max PD(Max) = $(125^\circ\text{C} - 25^\circ\text{C}) / (75^\circ\text{C/W}) = 1.33\text{W}$ for ESOP-8L packages.

The max PD(Max) = $(125^\circ\text{C} - 25^\circ\text{C}) / (95^\circ\text{C/W}) = 1.05\text{W}$ for DFN2x2-10L packages.

The max PD(Max) = $(125^\circ\text{C} - 25^\circ\text{C}) / (85^\circ\text{C/W}) = 1.18\text{W}$ for DFN2x3-10L packages.

The max PD(Max) = $(125^\circ\text{C} - 25^\circ\text{C}) / (70^\circ\text{C/W}) = 1.42\text{W}$ for DFN3x3-10L packages.

Thermal Application

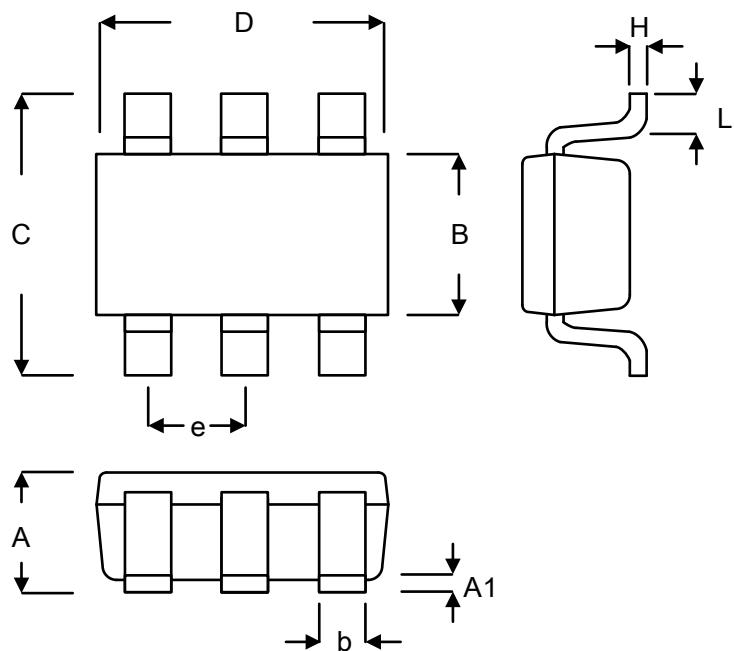

For continuous operation, do not exceed the absolute maximum junction temperature. The maximum power dissipation depends on the thermal resistance of the IC package, PCB layout, rate of surrounding airflow, and difference between junction and ambient temperature. The maximum power dissipation can be calculated as below:

Power dissipation (PD) is equal to the product of the output current and the voltage drop across the output pass element, as shown in the equation below:

$$PD = (V_{IN} - V_{OUT}) \times I_{CHG}$$

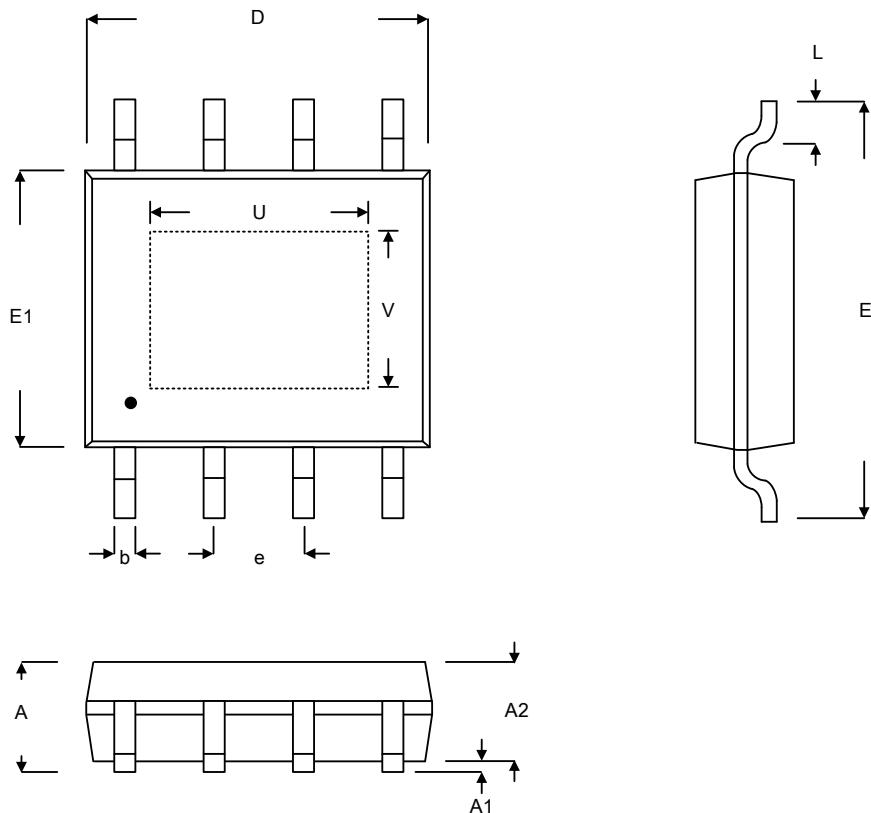

Layout Consideration

By placing input and output capacitors on the same side of the PCB as the Charger, and placing them as close as is practical to the package can achieve the best performance. The ground connections for input and output capacitors must be back to the DS6521 ground pin using as wide and as short of a copper trace as is practical. Connections using long trace lengths, narrow trace widths, and/or connections through via must be avoided. These add parasitic inductances and resistance that results in worse performance especially during transient conditions.
