

2.4A,40V Synchronous Rectifier

Description

NDP7824KC is a synchronous rectifier for switch mode power supplies, which combines an N-Channel MOSFET and a driver circuit designed for synchronous rectification in DCM and QR operation.

The synchronous rectification can effectively reduce the secondary side rectifier power dissipation and provide high performance solution. By sensing MOSFET SW-to-Source voltage, NDP7824KC can output ideal drive signal with less external components. It can provide high performance solution for 5V output voltage application.

Features

- Supports DCM and Quasi-Resonant Topologies
- Supports Low-side Rectification
- Max 85kHz Switching Frequency
- Fast Turn-off Total Delay of 30ns
- Compatible with Energy Star
- ~150uA Low Quiescent Current
- Available in SOP8 Package

Applications

- Chargers for Cell Phones
- AC/DC adapter
- Industrial Power Systems
- Flyback Converters

WW: Weekly (01-53)

Notes:

- (1) **RoHS:** Quoted from **RoHS Directive (EU) 2015/863**, Deep-Pool defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. Deep-Pool may reference these types of products as "**Pb-Free**".
- (2) **RoHS Exempt:** Deep-Pool defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.
- (3) **Green:** Deep-Pool defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JEDEC (**JS709C**) low halogen requirements of ≤ 1000 ppm threshold.
- (4) **MSL, Peak Temp. -** The Moisture Sensitivity Level rating according to the JEDEC (**J-STD-020F**) industry standard classifications, as well as the peak solder temperature of SMT and the floor life after unpacking, which customers should pay attention and strictly comply with the standard to use.
- (5) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

The information provided on this page represents **Deep-Pool's** knowledge and belief as of the date that it is provided. **Deep-Pool** bases its knowledge and belief on information provided by third parties and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. **Deep-Pool** has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. **Deep-Pool** and **Deep-Pool** suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

Pin Function and Definition

PIN	NAME	Description
1,2,3	GND	Ground
4	VCC	Power Supply
5,6,7,8	SW	Drain of Internal N-MOS

Absolute Maximum Ratings (at TA = 25°C)

Characteristics	Symbol	Rating	Unit
VCC to GND		-0.3 to 6.5	V
SW to GND		-0.3 to 45	V
Operating Junction Temperature	T _A	-40 to 150	°C
Storage Junction Temperature	T _{stg}	-65 to 150	°C
Thermal Resistance from Junction to case	θ _{JC}	80	°C/W
Thermal Resistance from Junction to ambient	θ _{JA}	160	°C/W

Notes:

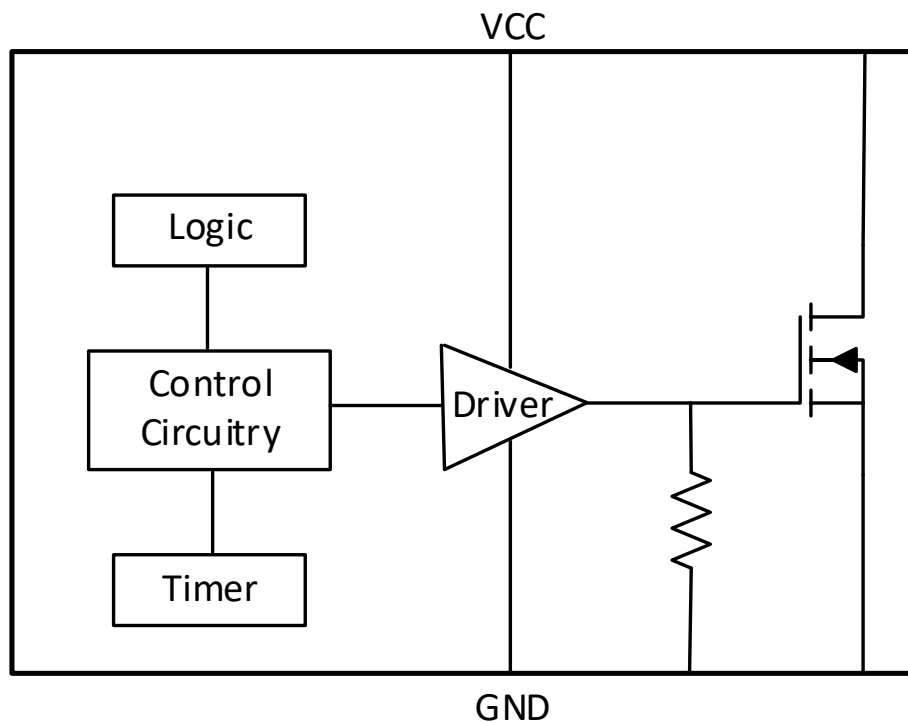

Stresses at or above those listed under Absolute Maximum Ratings may cause permanent damage to the product. This is a stress rating only; functional operation of the product at these or any other conditions above those indicated in the operational section of this specification is not implied. Operation beyond the maximum operating conditions for extended periods may affect product reliability.

Electrical Characteristics

$T_J = 25^{\circ}\text{C}$, $V_{IN} = 12\text{V}$, unless otherwise noted.

Characteristics	Symbol	Conditions	Min	Typ	Max	Units
Input Voltage	V_{CC}		3.6	-	6.0	V

Block Diagram

Operational Description

The NDP7824KC supports operation in DCM and Quasi-Resonant topologies. Operating in either a DCM or Quasi-Resonant topology, the control circuitry controls the gate in forward mode and will turn the gate off when the MOSFET current is low.

VCC Under Voltage Lockout (UVLO)

When the V_{CC} is below UVLO threshold, the part is in sleep mode and the internal N-MOS will be turn off.

Turn ON Phase

When the synchronous MOSFET is conducting, current will flow through its body diode which generates a negative V_{DS} across it. Because this body diode voltage drop is much smaller than the turn on threshold of the control circuitry (-170mV), which will then turn on the N-MOS.

Conducting Phase

When the synchronous N-MOS is turned on, V_{DS} becomes to rise according to its on resistance, as the current become smaller V_{DS} rises above the Driver Voltage Regulator (-37mV), the circuitry starts pulling down the gate driver which leads to the V_{DS} be regulated to a fixed voltage (the internal reference).

Turn OFF Phase

When the V_{DS} rises to trigger the turn off threshold (-20mV), the N-MOS gate voltage is pulled to low after about 30nS delay by the control circuitry, a $1.7\mu\text{S}$ blanking time is added after the synchronous N-MOS is turn off to avoid error trigger because of the ringing.

Blanking

The NDP7824KC control circuitry contains a blanking function. When it pulls the MOSFET OFF, it makes sure that the OFF state at least lasts for about $1.7\mu\text{s}$, so it is not recommended to set the synchronous period less than $1.6\mu\text{s}$ in flyback converter, otherwise shoot through may occur During normal operation.
