## Fast CMOS 3.3V 16-Bit Registered Transceiver

### Features

- Compatible with LCX™ Families of Products
- Supports 5V Tolerant Mixed Signal Mode Operation
  - Input Can Be 3V or 5V
- Output Can Be 3V or Connected to 5V Bus
- Advanced Low Power CMOS Operation
- Excellent Output Drive Capability:
  - Balanced Drives (24mA Sink and Source)
- Pin Compatible with Industry Standard Double-Density Pinouts
- Low Ground Bounce Outputs
- Hysteresis on All Inputs
- Multiple Center Pin and Distributed V<sub>CC</sub>/GND Pins Minimizing Switching Noise

### Description

Harris' CD74LPT16952 is produced in an advanced 0.6 micron CMOS technology, achieving industry leading speed grades.

The CD74LPT16952 is a 16-bit registered transceiver organized with two sets of eight D-type latches with separate input and output controls for each set. For data flow from A to B, for example, the A-to-B Enable ( $x\bar{CEAB}$ ) input must be LOW in order to enter data from  $xAx$ . The data present on the A port will be clocked on the B register when  $xCLKAB$  toggles from LOW-to-HIGH. The  $x\bar{OEAB}$  control performs the output enable function on the B port. Control of data from B to A is similar, but uses the  $x\bar{CEAB}$ ,  $xCLKAB$ , and  $x\bar{OEAB}$  inputs. By connecting the control pins of the two independent transceivers together, a full 16-bit operation can be achieved. The output buffers are designed with a Power-Off disable allowing "live insertion" of boards when used as backplane drivers.

The CD74LPT16952 can be driven from either 3.3V or 5.0V devices allowing this device to be used as a translator in a mixed 3.3/5.0V system.

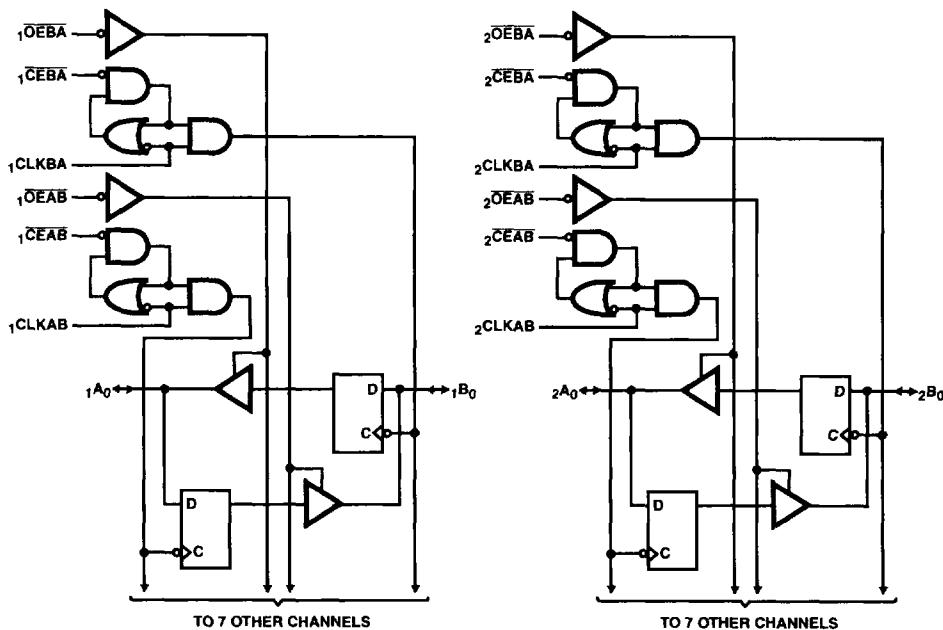

### Ordering Information

**Absolute Maximum Ratings**

DC Input Voltage ..... -0.5V to 7.0V  
 DC Output Current ..... 120mA

**Operating Conditions**

Operating Temperature Range ..... -40°C to 85°C  
 Supply Voltage to Ground Potential  
   Inputs and  $V_{CC}$  Only ..... -0.5V to 7.0V  
 Supply Voltage to Ground Potential  
   Outputs and D/O Only ..... -0.5V to 7.0V

**CAUTION:** Stresses above those listed in "Absolute Maximum Ratings" may cause permanent damage to the device. This is a stress only rating and operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied.

**NOTE:**

4.  $\theta_{JA}$  is measured with the component mounted on an evaluation PC board in free air.

**Thermal Information**

Thermal Resistance (Typical, Note 4)	$\theta_{JA}$ (°C/W)
TSSOP Package	85
SSOP Package	70
Maximum Junction Temperature	150°C
Maximum Storage Temperature Range	-65°C to 150°C
Maximum Lead Temperature (Soldering 10s)	300°C
(Lead Tips Only)

### NOTES:

5. For conditions shown as Max or Min, use appropriate value specified under Electrical Specifications for the applicable device type.
6. Typical values are at  $V_{CC} = 3.3\text{V}$ ,  $25^\circ\text{C}$  ambient and maximum loading.
7. Not more than one output should be shorted at one time. Duration of the test should not exceed one second.
8. This parameter is guaranteed but not tested.
9.  $V_{OH} = V_{CC} - 0.6\text{V}$  at rated current.
10. This parameter is determined by device characterization but is not production tested.
11. Per TTL driven input; all other inputs at  $V_{CC}$  or GND.
12. This parameter is not directly testable, but is derived for use in Total Power Supply Calculations.
13. Values for these conditions are examples of the  $I_{CC}$  formula. These limits are guaranteed but not tested.
14.  $I_C = I_{QUIESCENT} + I_{INPUTS} + I_{DYNAMIC}$   
 $I_C = I_{CC} + \Delta I_{CC} D_{HNT} + I_{CCD} (f_{CP}/2 + f_I N_I)$   
 $I_{CC} = \text{Quiescent Current}$   
 $\Delta I_{CC} = \text{Power Supply Current for a TTL High Input}$   
 $D_H = \text{Duty Cycle for TTL Inputs High}$   
 $N_T = \text{Number of TTL Inputs at } D_H$   
 $I_{CCD} = \text{Dynamic Current Caused by an Input Transition Pair (HLH or LHL)}$   
 $f_{CP} = \text{Clock Frequency for Register Devices (Zero for Non-Register Devices)}$   
 $N_{CP} = \text{Number of Clock Inputs at } f_{CP}$   
 $f_I = \text{Input Frequency}$   
 $N_I = \text{Number of Inputs at } f_I$   
All currents are in millamps and all frequencies are in megahertz.
15. Propagation Delays and Enable/Disable times are with  $V_{CC} = 3.3\text{V} \pm 0.3\text{V}$ , normal range. For  $V_{CC} = 2.7\text{V}$ , extended range, all Propagation Delays and Enable/Disable times should be degraded by 20%.
16. See test circuit and wave forms.
17. Minimum limits are guaranteed but not tested on Propagation Delays.
18. This parameter is guaranteed but not production tested.
19. Skew between any two outputs, of the same package, switching in the same direction. This parameter is guaranteed by design.
