

CMOS Decade Counter/Divider

Plus 10 Decoded Decimal Outputs

The RCA-CD4017A consists of a 5-stage Johnson decade counter and an output decoder which converts the Johnson binary code to a decimal number. Inputs include a CLOCK, a RESET, and a CLOCK INHIBIT signal.

The decade counter is advanced one count at the positive clock signal transition if the CLOCK INHIBIT signal is low. Counter advancement via the clock line is inhibited when the clock INHIBIT signal is high. A high reset signal clears the decade counter to

its zero count. Use of the Johnson decade counter configuration permits high speed operation, 2-input decimal decode gating, and spike-free decoded outputs. Anti-lock gating is provided, thus assuring proper counting sequence. The 10 decoded outputs are normally low and go high only at their respective decimal time slot. Each decoded output remains high for one full clock cycle. A CARRY-OUT (COUT) signal completes one cycle every 10 clock input cycles and is used to clock the succeeding decade directly in a multi-decade counting chain.

These types are supplied in 16-lead hermetic dual-in-line ceramic packages (D and F suffixes), 16-lead dual-in-line plastic packages (E suffix), 16-lead ceramic flat packages (K suffix), and in chip form (H suffix).

Features:

- Synchronous decade counter plus 10 decoded outputs
- Fully static operation
- Medium speed operation. 5 MHz (typ.) at $V_{DD} - V_{SS} = 10\text{ V}$
- Quiescent current specified to 15 μA
- Maximum input leakage current of 1 μA at 15 V (full package-temperature range)
- 1-V noise margin (full package-temperature range)

Applications:

- Decade counter/decimal decode display
- Frequency division
- Counter control/timers
- Divide by N counting
 $N = 2 - 10$ with one CD4017A and one one CD4001A
 $N > 10$ with multiple CD4017A's

Fig. 12 - Divide by N counter (N ≤ 10) with N decoded outputs.

When the Nth decoded output is reached (Nth clock pulse) the S-R flip flop (constructed from two NOR gates of the CD4001A) generates a reset pulse which clears the CD4017A to its zero count. At this time, if the Nth decoded output is greater than or equal to 6, the COUT line goes high to clock the next CD4017A counter section. The "0" decoded output also goes high at this time. Coincidence of the clock low and decoded "0" output low resets the S-R flip flop to enable the CD4017A. If the Nth decoded output is less than 6, the COUT line will not go high and, therefore, cannot be used. In this case "0" decoded output may be used to perform the clocking function for the next counter.
