

# RAM1A..G

1-pole, solid state relay with LED and built-in Varistor, VDE certified

## Main features

- AC switching Solid State Relay
- Direct copper bonding (DCB) technology
- Back to Back thyristor output
- VDE certified for Glow wire test according to IEC/EN 60335-1
- 100,000 cycles UL endurance test\*
- Integrated overvoltage protection
- LED for control presence indication
- Clip-on IP20 protection cover
- Self-lifting terminals
- 65 kA UL short circuit current rating

\* selected models

## Description

The industrial, 1-phase relay with antiparallel thyristor output is the most widely used industrial SSR due to its multiple application possibilities. The relay can be used for resistive, inductive and capacitive loads. The zero switching relay switches ON when the sinusoidal curve crosses zero and switches OFF when the current crosses zero. The built-in varistor secures transient protection. The LED indicates the status of the control input. The clipon cover secures touch protection (IP 20). Protected output terminals can handle cables up to 16 mm<sup>2</sup>.

Specifications are at a surrounding temperature of 25°C unless otherwise specified.

## Applications

Plastic injection machines, Extrusion machines, Blow moulding machines, Thermoformers, Dryers, Electrical ovens, Fryers, Shrink tunnels, Air handling units, Sterilisation equipment, Climatic chambers, Ovens and furnaces, Ambient heating.

## Main functions

- 1-pole, zero cross switching
- Rated output voltage up to 660 VAC
- Rated output current up to 125 AAC
- 3(4)-32 VDC or 20-280 VAC/22-48 VDC control voltage range

#### Note:

- Control input lines must be installed together to maintain products' susceptibility to Radio Frequency interference.
- The control terminals A1, A2 (RAM1A..A..G) shall be supplied by a secondary circuit where power is limited by a transformer, rectifier, voltage divider, or similar device that derives power from a primary circuit, and where the short-circuit limit between conductors of the secondary circuit or between conductors and ground is 1500 VA or less. The short-circuit volt ampere limit is the product of the open circuit voltage and the short circuit ampere.
- Performance Criteria 1 (PC1): No degradation of performance or loss of function is allowed when the product is operated as intended.
- Performance Criteria 2 (PC2): During the test, degradation of performance or partial loss of function is allowed. However when the test is complete the product should return operating as intended by itself.
- Performance Criteria 3 (PC3): Temporary loss of function is allowed, provided the function can be restored by manual operation of the controls.

**Short circuit protection**

**Protection Co-ordination, Type 1 vs Type 2:**

Type 1 protection implies that after a short circuit, the device under test will no longer be in a functioning state. In Type 2 co-ordination the device under test will still be functional after the short circuit. In both cases, however the short circuit has to be interrupted. The fuse between enclosure and supply shall not open. The door or cover of the enclosure shall not be blown open. There shall be no damage to conductors or terminals and the conductors shall not separate from terminals. there shall be no breakage or cracking of insulating bases to the extent that the integrity of the mounting of live parts is impaired. Discharge of parts or any risk of fire shall not occur.

The product variants listed in the table hereunder are suitable for use on a circuit capable of delivering not more than 65,000 Arms Symmetrical Amperes, 600Volts maximum when protected by fuses. Tests at 65,000A were performed with Class J, fast acting: please refer to the table below for maximum allowed ampere rating of the fuse. Use fuses only.
