

ASMB-MTB1-0B3A2

PLCC-4 Tricolor Black Surface LED

Overview

The LEDs in this family of Broadcom[®] SMT LEDs are in a plastic leaded chip carrier PLCC-4 package. A wide viewing angle of 115°, together with a built-in reflector, drives up the intensity of light output making these LEDs suitable for use in interior electronic signs. The black top surface of the LED provides better contrast enhancement, especially in full color displays.

These LEDs are compatible with the reflow soldering process. For easy pick-and-place assembly, the LEDs are shipped in tape and reel. Each reel, except for the red color, is shipped from a single intensity and color bin for better uniformity.

Features

- Standard PLCC-4 package
- LED package with diffused silicone encapsulation
- High brightness using AlInGaP and InGaN dice technologies
- Typical viewing angle of 115°
- Compatible with the reflow soldering process
- JEDEC MSL 3

Applications

- Indoor full-color displays

CAUTION! This LED is ESD sensitive. Please observe appropriate precautions during handling and processing. Refer to Application Note AN-1142 for additional details.

Figure 1: Package Drawing

Pin	Configuration
1	Red Cathode
2	Green Cathode
3	Blue Cathode
4	Common Anode

NOTE:

1. All dimensions are in millimeters (mm).
2. Tolerance is ± 0.20 mm unless otherwise specified.
3. Encapsulation = silicone.
4. Terminal finish = silver plating.

Figure 2: Circuit Diagram

Absolute Maximum Ratings

Parameter	Red	Green	Blue	Unit
DC Forward Current ^a	25	25	25	mA
Peak Forward Current ^b	100	100	100	mA
Power Dissipation	65	90	90	mW
Reverse Voltage	Not recommended for reverse bias operation			
LED Junction Temperature	110			°C
Operating Temperature Range	-40 to +100			°C
Storage Temperature Range	-40 to +100			°C

a. Derate linearly as shown in Figure 9, Figure 10, Figure 11, and Figure 12.

b. Duty factor = 10%, frequency = 1 kHz.

Optical Characteristics (T_J = 25°C, I_F = 20 mA)

Color	Luminous Intensity, I _V (mcd) ^a			Dominant Wavelength, λ _d (nm) ^b			Peak Wavelength, λ _p (nm)	Viewing Angle, 2θ _½ (°) ^c
	Min.	Typ.	Max.	Min.	Typ.	Max.	Typ.	Typ.
Red	450	—	900	619	625	629	634	115
Green	1800	—	3550	525	530	535	522	115
Blue	355	—	715	465	470	473	465	115

a. The luminous intensity, I_V is measured at the mechanical axis of the package and it is tested with a single current pulse condition. The actual peak of the spatial radiation pattern may not be aligned with the axis.

b. The dominant wavelength, λ_d is derived from the CIE Chromaticity Diagram and represents the perceived color of the device.

c. θ_½ is the off-axis angle where the luminous intensity is half of the peak intensity.

Electrical Characteristics (T_J = 25°C, I_F = 20 mA)

Color	Forward Voltage V _F (V) ^a			Reverse Voltage, V _R (V) at I _R = 100 μA ^b	Reverse Voltage, V _R (V) at I _R = 10 μA ^b	Thermal Resistance, R _{θJ-S} (°C/W) ^c	
	Min.	Typ.	Max.	Min.	Min.	1 Chip On	3 Chips On
Red	1.8	2.1	2.6	4.0	—	609	653
Green	2.8	3.1	3.6	—	4.0	320	430
Blue	2.8	3.1	3.6	—	4.0	320	430

a. Forward voltage tolerance is ±0.1V.

b. Indicates product final test condition. Long term reverse bias is not recommended.

c. Thermal resistance from LED junction to solder point.

Part Numbering System

A S M B - M T x₁ 1 - 0 x₂ x₃ x₄ x₅

Code	Description	Option	
x ₁	Package Type	B	Black Surface
x ₂	Minimum Intensity Bin	B	Red = Bin U1
			Green = Bin X1
			Blue = Bin T2
			Red : Bin U1, U2, V1
			Green : Bin X1, X2, Y1
			Blue : Bin T2, U1, U2
x ₃	Number of Intensity Bins	3	3 Intensity Bins from Minimum
x ₄	Color Bin Option	A	Red = Full Distribution
			Green = Bin A, B, D
			Blue = Bin A, B, C
x ₅	Test Option	2	Test Current = 20 mA

Bin Information

Intensity Bin Limits (CAT)

Precautionary Notes

Soldering

- Do not perform reflow soldering more than twice. Observe necessary precautions of handling moisture-sensitive devices as stated in the following section.
- Do not apply any pressure or force on the LED during reflow and after reflow when the LED is still hot.
- Use reflow soldering to solder the LED. Use hand soldering only for rework if unavoidable, but it must be strictly controlled to following conditions:
 - Soldering iron tip temperature = 315°C maximum
 - Soldering duration = 3 seconds maximum
 - Number of cycles = 1 only
 - Power of soldering iron = 50W maximum
- Do not touch the LED package body with the soldering iron except for the soldering terminals, as it may cause damage to the LED.
- Confirm beforehand whether the functionality and performance of the LED is affected by soldering with hand soldering.

Figure 20: Recommended Board Reflow Direction

Handling Precautions

The encapsulation material of the LED is made of silicone for better product reliability. Compared to epoxy encapsulant, which is hard and brittle, silicone is softer and flexible. Observe special handling precautions during assembly of silicone encapsulated LED products. Failure to comply might lead to damage and premature failure of the LED. Refer to Broadcom Application Note AN5288, *Silicone Encapsulation for LED: Advantages and Handling Precautions*, for additional information.

- Do not poke sharp objects into the silicone encapsulant. Sharp objects, such as tweezers or syringes, might apply excessive force or even pierce through the silicone and induce failures to the LED die or wire bond.
- Do not touch the silicone encapsulant. Uncontrolled force acting on the silicone encapsulant might result in excessive stress on the wire bond. Hold the LED only by the body.
- Do not stack assembled PCBs together. Use an appropriate rack to hold the PCBs.
- The surface of silicone material attracts dust and dirt easier than epoxy, due to its surface tackiness. To remove foreign particles on the surface of silicone, use a cotton bud with isopropyl alcohol (IPA). During cleaning, rub the surface gently without putting too much pressure on the silicone. Ultrasonic cleaning is not recommended.
- For automated pick-and-place, Broadcom has tested a nozzle size with OD 3.5 mm to work with this LED. However, due to the possibility of variations in other parameters such as pick-and-place machine maker/model, and other settings of the machine, verify that the selected nozzle will not cause damage to the LED.

Handling of Moisture-Sensitive Devices

This product has a Moisture Sensitive Level 3 rating per JEDEC J-STD-020. Refer to Broadcom Application Note AN5305, *Handling of Moisture Sensitive Surface Mount Devices*, for additional details and a review of proper handling procedures.

- Before use:
 - An unopened moisture barrier bag (MBB) can be stored at $40^{\circ}\text{C}/90\% \text{RH}$ for 12 months. If the actual shelf life has exceeded 12 months and the Humidity Indicator Card (HIC) indicates that baking is not required, then it is safe to reflow the LEDs per the original MSL rating.
 - Do not open the MBB prior to assembly (for example, for IQC). If unavoidable, MBB must be properly resealed with fresh desiccant and HIC. The exposed duration must be taken in as floor life.
- Control after opening the MBB:
 - Read the HIC immediately upon opening of MBB.
 - Keep the LEDs at $30^{\circ}\text{C}/60\% \text{RH}$ at all times, and complete all high temperature-related processes, including soldering, curing or rework within 168 hours.
- Control for unfinished reel:

Store unused LEDs in a sealed MBB with desiccant or a desiccator at $5\% \text{RH}$.
- Control of assembled boards:

If the PCB soldered with the LEDs is to be subjected to other high-temperature processes, store the PCB in a sealed MBB with desiccant or desiccator at $5\% \text{RH}$ to ensure that all LEDs have not exceeded their floor life of 168 hours.
- Baking is required if:
 - The HIC indicator indicates a change in color for 10% and 5%, as stated on the HIC.
 - The LEDs are exposed to conditions of $30^{\circ}\text{C}/60\% \text{RH}$ at any time.
 - The LED's floor life exceeded 168 hours.

The recommended baking condition is: $60^{\circ}\text{C} \pm 5^{\circ}\text{C}$ for 20 hours.

Baking can only be done once.
- Storage:

The soldering terminals of these Broadcom LEDs are silver plated. If the LEDs are exposed in ambient environments for too long, the silver plating might be oxidized, thus affecting its solderability performance. As such, keep unused LEDs in a sealed MBB with desiccant or in a desiccator at $5\% \text{RH}$.

Application Precautions

- The drive current of the LED must not exceed the maximum allowable limit across temperature as stated in the data sheet. Constant current driving is recommended to ensure consistent performance.
- Circuit design must cater to the whole range of forward voltage (V_F) of the LEDs to ensure the intended drive current can always be achieved.
- The LED exhibits slightly different characteristics at different drive currents, which may result in a larger variation of performance (meaning: intensity, wavelength, and forward voltage). Set the application current as close as possible to the test current to minimize these variations.
- Do not use the LED in the vicinity of material with sulfur content or in environments of high gaseous sulfur compounds and corrosive elements. Examples of material that might contain sulfur are rubber gaskets, room-temperature vulcanizing (RTV) silicone rubber, rubber gloves, and so on. Prolonged exposure to such environments may affect the optical characteristics and product life.
- White LEDs must not be exposed to acidic environments and must not be used in the vicinity of any compound that may have acidic outgas, such as, but not limited to, acrylate adhesive. These environments have an adverse effect on LED performance.
- Avoid rapid change in ambient temperature, especially in high-humidity environments, because they cause condensation on the LED.
- If the LED is intended to be used in a harsh or an outdoor environment, protect the LED against damages caused by rain water, water, dust, oil, corrosive gases, external mechanical stresses, and so on.

Thermal Management

The optical, electrical, and reliability characteristics of the LED are affected by temperature. Keep the junction temperature (T_J) of the LED below the allowable limit at all times. T_J can be calculated as follows:

$$T_J = T_A + R_{\theta J-A} \times I_F \times V_{Fmax}$$

where:

T_A = ambient temperature ($^{\circ}\text{C}$)

$R_{\theta J-A}$ = thermal resistance from LED junction to ambient ($^{\circ}\text{C}/\text{W}$)

I_F = forward current (A)

V_{Fmax} = maximum forward voltage (V)

The complication of using this formula lies in T_A and $R_{\theta J-A}$. Actual T_A is sometimes subjective and hard to determine. $R_{\theta J-A}$ varies from system to system depending on design and is usually not known.

Another way of calculating T_J is by using the solder point temperature, T_S , as follows:

$$T_J = T_S + R_{\theta J-S} \times I_F \times V_{Fmax}$$

where:

T_S = LED solder point temperature as shown in [Figure 21](#) ($^{\circ}\text{C}$)

$R_{\theta J-S}$ = thermal resistance from junction to solder point ($^{\circ}\text{C}/\text{W}$)

I_F = forward current (A)

V_{Fmax} = maximum forward voltage (V)

Figure 21: T_S Point (PIN 4)

T_S can be easily measured by mounting a thermocouple on the soldering joint as shown in [Figure 21](#), while $R_{\theta J-S}$ is provided in the data sheet. Verify the T_S of the LED in the final product to ensure that the LEDs are operating within all maximum ratings stated in the data sheet.

Eye Safety Precautions

LEDs may pose optical hazards when in operation. Do not look directly at operating LEDs because it might be harmful to the eyes. For safety reasons, use appropriate shielding or personal protective equipment.
