

# HD641180X, HD643180X, HD647180X— MCU (Micro Controller Unit)

## ■ DESCRIPTION

The HD643180X provides instruction compatibility with the HD64180 and incorporates a 16-kbyte Mask ROM, 512-byte RAM, memory management unit (MMU), DMA controller, timer, asynchronous serial communications interface (ASCI), clocked serial I/O ports (CSI/O), analog comparator and parallel I/O pins on a single chip.

The HD647180X incorporates a 16-kbyte PROM instead of mask ROM.

The internal PROM can be programmed and verified under the same specifications as the 27256 type EPROM ( $V_{pp}12.5V$ ) using a general-purpose PROM writer.

In addition, the HD643180X and HD647180X are functionally identical except for their internal ROMs.

The HD641180X functions in the same way as the HD643180X or HD647180X, except that the HD641180X has no internal ROM.

## ■ FEATURES

### Software

- Instruction set compatible with the HD64180

### Hardware

- 16-kbyte ROM (HD643180X and HD647180X) and 512-byte RAM
- Timer
  - One-channel 16-bit timer with input capture, output compare, and timer overflow functions
  - Two-channel 16-bit reload timer
- Six-channel analog comparator
- 54 parallel I/O pins
  - Includes eight high current pins ( $I_{OL} = 10mA$ )
- MMU with 1-Mbyte memory physical address space
- Two-channel DMA controller
- Two-channel ASCI
- One-channel CSI/O
- Four external and eleven internal interrupts
- DRAM refresh controller and low speed memory, I/O interface
- Operating frequency up to 8 MHz (to clock)
- Low power operation
- Four operation modes (HD643180X and HD647180X)
  - Mode 0: single-chip mode
  - Mode 1: expanded mode (internal ROM disabled)
  - Mode 2: expanded mode (internal ROM enabled)
  - Mode 3: PROM programming mode (HD647180X only)
- Internal ROM data protect function (HD647180X only)
- Packages
  - 80-pin quad flat package
  - 84-pin plastic leaded chip carrier
  - 90-pin dual inline package

## ■ BLOCK DIAGRAM

The HD647180X combines a high-performance CPU core with many of the systems and I/O resources required by a broad range of applications (figure 2).

The CPU core consists of five functional blocks:

- Clock generator
- Bus state controller
- Interrupt controller
- Memory management unit (MMU)
- Central processing unit (CPU)

The Integrated I/O resources comprise the remaining four functional blocks:

- DMA controller (DMAC: two channels)
- Asynchronous serial communication interface (ASCI: two channels)
- Clocked serial I/O port (CSI/O: one channel)
- Programmable reload timer (PRT: two channels)
- Programmable timer 2 (PT2: one channel)
- Analog comparator (six channels)
- I/O ports

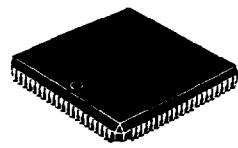

The memory consists of:

- RAM (512 bytes)
- PROM (16 kbyte): HD647180X
- Mask ROM (16 kbyte): HD643180X

## ■ CPU Architecture

The five CPU core functional blocks are described in this section.

### **Clock Generator**

The clock generator generates the system clock ( $\phi$ ) from an external crystal or external clock input. Also, the system clock is programmably prescaled to generate timing for the on-chip I/O and system support devices.

### **Bus State Controller**

The bus state controller performs all status/control bus activity. This includes external bus cycle wait state timing,  $\overline{\text{RESET}}$ , DRAM refresh, and master DMA bus exchange. Generates 'dual-bus' control signals for compatibility with peripheral devices.

### **Interrupt Controller**

The interrupts controller monitors and prioritizes the four external and eight internal interrupt sources. A variety of interrupt response modes are programmable.

### **Memory Management Unit (MMU)**

Maps the CPU 64-kbyte logical memory address space into a 1-Mbyte physical memory address space. The MMU organization preserves software object code compatibility while providing extended memory access and uses an efficient 'common area—bank area' scheme. I/O accesses (64-kbyte I/O address space) bypass the MMU.

### **Central Processing Unit (CPU)**

The CPU is microcoded to implement an upward-compatible superset of the 8-bit standard software instruction set. Many instructions require fewer clock cycles for execution and seven new instructions are added.

### **Mode Selection**

Mode program pins,  $\text{MP}_0$  and  $\text{MP}_1$  determine the operation mode of the LSI (table 4).

## ■ I/O Resources

### **DMA Controller (DMAC)**

The two channel DMAC provides high speed memory to/from memory, memory

to/from I/O, and memory to/from memory-mapped I/O transfers. The DMAC features edge or level sense request input, address increment/decrement/no-change and (for memory to/from memory transfers) programmable burst or cycle steal transfer. In addition, the DMAC can directly access the full 1-Mbyte of physical memory address space (the MMU is bypassed during DMA) and transfers (up to 64-kbyte in length) can cross 64-kbyte boundaries.

### **Asynchronous Serial Communication Interface (ASCI)**

The ASCI provides two separate full-duplex UARTs and includes a programmable baud rate generator, modem control signals, and a multiprocessor communication format. The ASCI can use the DMAC for high-speed serial data transfer, reducing CPU overhead.

### **Clocked Serial I/O Port (CSI/O)**

The CSI/O half-duplex clocked serial transmitter and receiver can be used for simple, high-speed connection to another microprocessor or microcomputer.

### **Programmable Reload Timer (PRT)**

The PRT contains two separate channels, each consisting of 16-bit timer data and 16-bit timer reload registers. The time base is the system clock divided by 20 (fixed) and PRT channel 1 has an optional output allowing waveform generation.

### **Programmable Timer 2 (PT2)**

The PT2 16-bit programmable timer can measure an input waveform and generate two independent output waveforms. The pulse widths of both input/output waveforms vary from microseconds to seconds.

### **Analog Comparator**

The HD641180X/HD643180X/HD647180X provides an analog comparator with 6 channels. Each channel can be programmed as a reference voltage ( $V_{ref}$ ) input pin or a compared voltage ( $V_{in}$ ) input pin.

### **Input Output Port (I/O Port)**

The HD643180X/HD647180X provides seven I/O ports. (port A–G). Each port consists of a data direction register (DDR) to determine the directions of the individual pins, an output data register (ODR) to hold output data and an input data register (IDR) to latch input data. However, Port G does not have a DDR or ODR since it is an input-only port.

## ■ Pins Signal Description

### **XTAL, EXTAL: Crystal (Input)**

XTAL and EXTAL are the crystal oscillator connections. An external TTL clock can be input on EXTAL. XTAL should be left open if an external TTL clock is used. Note that XTAL, XTAL is schmitt triggered. See DC characteristics.

### **$\phi$ (OUT)**

$\phi$  is the system clock output. Its frequency is equal to one-half of the crystal oscillator's.

### **$\overline{\text{RESET}}$ : CPU Reset (Input)**

When  $\overline{\text{RESET}}$  is low, it initializes the HD641180X/HD643180X/HD647180X CPU. All output signals are held inactive during reset.

### **$A_0$ - $A_{19}$ : Address Bus (Output, Three-State)**

The address bus enters the high-impedance state during reset and when another device acquires the bus as indicated by  $\overline{\text{BUSREQ}}$  and  $\overline{\text{BUSACK}}$  low. During reset, the address function is selected.

### **$D_0$ - $D_7$ : Data Bus (Input/Output, Three-State)**

The bidirectional 8-bit data bus enters the high-impedance state during reset and when another device acquires the bus as indicated by  $\overline{\text{BUSREQ}}$  and  $\overline{\text{BUSACK}}$  low.

### **$\overline{\text{RD}}$ : Read (Output, Three-State)**

During a CPU read cycle,  $\overline{\text{RD}}$  enables transfer from the external memory or I/O device to the CPU data bus.

### **$\overline{\text{WR}}$ : Write (Output, Three-State)**

During a CPU write cycle,  $\overline{\text{WR}}$  enables transfer from the CPU data bus to the external memory or I/O device.

### **$\overline{\text{ME}}$ : Memory Enable (Output, Three-State)**

$\overline{\text{ME}}$  indicates memory read or write operations. The HD641180X/HD643180X/HD647180X asserts  $\overline{\text{ME}}$  low in the following cases.

- When fetching instructions and operands
- When reading or writing memory data
- During DMA memory access cycles
- During dynamic RAM refresh cycles

#### **IOE: I/O Enable (Output, Three-State)**

**IOE** indicates I/O read or write operations. The HD641180X/HD643180X/HD647180X asserts **IOE** low in the following cases:

- When reading or writing I/O data
- During DMA I/O access cycles
- During **INT<sub>0</sub>** acknowledge cycle

#### **WAIT: Bus Cycle Wait (Input)**

**WAIT** introduces wait states to extend memory and I/O cycles. If low at the falling edge of  $T_2$ , a wait state ( $T_w$ ) is inserted. Wait states will continue to be inserted until the **WAIT** input is sampled high at the falling edge of  $T_w$ , at which time the bus cycle will proceed to completion.

#### **E: Enable (Output)**

**E** is a synchronous clock for connection to HD63XX series and other 6800/6500 series compatible peripheral LSIs.

#### **BUSREQ: Bus Request (Input)**

Another device may request use of the bus by asserting **BUSREQ** low. The CPU will stop executing instructions and place the address bus, data bus, **RD**, **WR**, **ME**, and **IOE** in the high-impedance state.

3

#### **BUSACK: Bus Acknowledge (Output)**

When the CPU completes bus release (in response to **BUSREQ** low), it will assert **BUSACK** low. This acknowledges that the bus is free for use by the requesting device.

#### **HALT: Halt/Sleep Status (Output)**

**HALT** is asserted low after execution of the HALT or SLP instructions. Used with **LIR** and ST output pins to encode CPU status (table 2).

#### **LIR: Load Instruction Register (Output)**

**LIR** is asserted low when the current cycle is an opcode fetch cycle. Used with **HALT** and ST output pins to encode CPU status (table 2).

**ST: Status (Output)**

ST is used with the  $\overline{\text{HALT}}$  and  $\overline{\text{LIR}}$  output pins to encode CPU status (table 2).

**Table 2 Status Summary**

<b>ST</b>	<b>HALT</b>	<b>LIR</b>	<b>Operation</b>
0	1	0	CPU operation (1st opcode fetch)
1	1	0	CPU operation (2nd opcode and 3rd opcode fetch)
1	1	1	CPU operation (MC except for opcode fetch)
0	X	1	DMA operation
0	0	0	Halt mode
1	0	1	Sleep mode (including System stop mode)

Note X: Don't care

MC: Machine cycle

**REF: Refresh (Output)**

When low,  $\overline{\text{REF}}$  indicates that the CPU is in a dynamic RAM refresh cycle and the low-order 8 bits ( $A_0-A_7$ ) of the address bus contain the refresh address.

**NMI: Non-Maskable Interrupt (Input)**

When high to low is detected, it forces the CPU to save certain state information and vector to an interrupt service routine at address 0066H. The saved state information is restored by executing the RETN (return from non-maskable interrupt) instruction.

**INT<sub>0</sub>: Maskable Interrupt Level 0 (Input)**

When low,  $\overline{\text{INT}_0}$  requests a CPU interrupt (unless masked) and saves certain state information unless masked by software.  $\overline{\text{INT}_0}$  requests service using one of three software programmable interrupt modes (table 3).

**Table 3 Interrupt Modes**

Mode	Operation
0	Instruction fetched and executed from data bus
1	Instruction fetched and executed from address 0038H
2	Vector system: Low-order 8 bits of vector table address fetched from data bus

In all modes, the saved state information is restored by executing the RETI (return from interrupt) instruction.

#### **INT<sub>1</sub>, INT<sub>2</sub>: Maskable Interrupt Levels 1, 2 (Input)**

When low, INT<sub>1</sub> and INT<sub>2</sub> request a CPU interrupt (unless masked) and save certain state information unless masked by software. INT<sub>1</sub> and INT<sub>2</sub> (and internally generated interrupts) request interrupt service using a vector system similar to mode 2 of INT<sub>0</sub>.

#### **DREQ<sub>0</sub> DMA Request—Channel 0 (Input)**

DREQ<sub>0</sub> low (programmable edge or level sense) requests DMA transfer service from channel 0 of the HD641180X/HD643180X/HD647180X DMAC. DREQ<sub>0</sub> is used for channel 0 memory to/from I/O and memory to/from memory-mapped I/O transfers. DREQ<sub>0</sub> is not used for memory to/from memory transfers. This pin is multiplexed with CKA<sub>0</sub>.

#### **TEND<sub>0</sub>: Transfer End—Channel 0 (Output)**

TEND<sub>0</sub> is asserted low synchronous with the last write cycle of channel 0 DMA transfer to indicate DMA completion to an external device. This pin is multiplexed with CKA<sub>1</sub>.

3

#### **DREQ<sub>1</sub>: DMA Request—Channel 1 (Input)**

DREQ<sub>1</sub> low (programmable edge or level sense) requests DMA transfer service from channel 1 of the HD641180X/HD643180X/HD647180X DMAC. Channel 1 supports memory to/from I/O transfers.

#### **TEND<sub>1</sub>: Transfer End—Channel 1 (Output)**

TEND<sub>1</sub> is asserted low synchronous with the last write cycle of channel 1 DMA transfer to indicate DMA completion to an external device.

**TXA<sub>0</sub>: Asynchronous Transmit Data—Channel 0 (Output)**

TXA<sub>0</sub> is the asynchronous transmit data from channel 0 of the asynchronous serial communication interface (ASCI).

**RXA<sub>0</sub>: Asynchronous Receive Data—Channel 0 (Input)**

RXA<sub>0</sub> is the asynchronous receive data to channel 0 of the ASCI.

**CKA<sub>0</sub>: Asynchronous Clock—Channel 0 (Input/Output)**

CKA<sub>0</sub> is the clock input/output for channel 0 of the ASCI. This pin is multiplexed (software selectable) with DREQ<sub>0</sub>.

**RTS<sub>0</sub>: Request to Send—Channel 0 (Output)**

RTS<sub>0</sub> is the programmable modem control output signal for channel 0 of the ASCI.

**CTS<sub>0</sub>: Clear to Send—Channel 0 (Output)**

CTS<sub>0</sub> is the modem control input signal for channel 0 of the ASCI.

**DCD<sub>0</sub>: Data Carrier Detect—Channel 0 (Output)**

DCD<sub>0</sub> is the modem control input signal for channel 0 of the ASCI.

**TXA<sub>1</sub>: Asynchronous Transmit Data—Channel 1 (Output)**

TXA<sub>1</sub> is the asynchronous transmit data from channel 1 of the ASCI.

**RXA<sub>1</sub>: Asynchronous Receive Data—Channel 1 (Input)**

RXA<sub>1</sub> is the asynchronous receive data to channel 1 of the ASCI.

**CKA<sub>1</sub>: Asynchronous Clock—Channel 1 (Input/Output)**

CKA<sub>1</sub> is the clock input/output for channel 1 of the ASCI. This pin is multiplexed (software selectable) with TEND<sub>0</sub>.

**CTS<sub>1</sub>: Clear to Send—Channel 1 (Input)**

CTS<sub>1</sub> is the modem control input signal for channel 1 of the ASCI. This pin is multiplexed (software selectable) with RXS.

**TXS: Clocked Serial Transmit Data (Output)**

Clocked serial transmit data from the Clocked Serial I/O Port (CSI/O).

**RXS: Clocked Serial Receive Data (Input)**

Clocked serial receive data to the CSI/O. This pin is multiplexed (software selectable) with ASCI channel 1  $\overline{CTS}_1$  modem control input.

**CKS: Serial Clock (Input/Output)**

Input or output clock for the CSI/O.

**TOUT1: Timer Output (Output)**

Pulse output from Programmable Reload Timer channel 1.

**AN<sub>0</sub>-AN<sub>5</sub>: Comparator (Input)**

AN<sub>0</sub>-AN<sub>5</sub> input data to the analog comparator. Select two of these pins and apply the reference voltage (V<sub>ref</sub>) and the voltage to be compared (V<sub>in</sub>) to them.

**PA<sub>0</sub>-PA<sub>7</sub>, PB<sub>0</sub>-PB<sub>7</sub>, PC<sub>0</sub>-PC<sub>7</sub>, PD<sub>0</sub>-PD<sub>7</sub>, PE<sub>0</sub>, PE<sub>7</sub>, PF<sub>0</sub>-PF<sub>7</sub>; Parallel Ports A-F (Input/Output)**

Ports A-F are 8-bit I/O ports. Each pin of each port can be individually configured as an input or output depending on the port data direction register. At reset, each port is initialized as an input port.

3

**PG<sub>0</sub>-PG<sub>5</sub>: Parallel Port G (Input)**

Port G is a 6-bit input port.

**IC: Input Capture (Input)**

IC inputs the input capture signal for timer 2.

**TOUT2, TOUT3: Timer Output 2, 3 (Output)**

TOUT2 and TOUT3 are timer 2's outputs.

**MP<sub>0</sub>, MP<sub>1</sub>: Mode Program 0, 1 (Input)**

The mode program pins, MP<sub>0</sub> and MP<sub>1</sub>, determine the operation mode of the MPU as shown in table 4.

**Table 4. Operating Mode Selection**

<b>MP<sub>1</sub></b>	<b>MP<sub>0</sub></b>	<b>ROM</b>	<b>RAM</b>	<b>Operating Mode</b>	<b>Applicable Wide-Range</b>
0	0	I	I	0; Single chip mode	HD643180X HD647180X
0	1	E	I	1; Expanded mode 1	HD643180X HD647180X HD641180X
1	0	I	I	2; Expanded mode 2	HD643180X HD647180X
1	1	I	—	3; PROM programming mode (HD647180X only)	HD647180X

I: Internal E: External

Select mode 1 (MP<sub>1</sub> = 0, MP<sub>0</sub> = 1) for the HD641180X.**Vcc, Vss: Power**

VCC is power supply. VSS is the ground.

**■ Multiplexed Pins****PA<sub>0</sub>/TXA<sub>1</sub>, PA<sub>1</sub>/RXA<sub>1</sub>, PA<sub>3</sub>/TXS, PA<sub>5</sub>/CKS, PA<sub>6</sub>/DREQ<sub>1</sub>, PA<sub>7</sub>/TEND<sub>1</sub>**

At reset, PA<sub>0</sub>/TXA<sub>1</sub>, PA<sub>1</sub>/RXA<sub>1</sub>, PA<sub>3</sub>/TXS, PA<sub>5</sub>/CKS, PA<sub>6</sub>/DREQ<sub>1</sub>, and PA<sub>7</sub>/TEND<sub>1</sub> are configured as port A input. They can be used as TXA<sub>1</sub>, RXA<sub>1</sub>, TXS, CKS, DREQ<sub>1</sub>, and TEND<sub>1</sub> by setting the corresponding bit in the port A disable register to 1.

**PA<sub>2</sub>/CKA<sub>1</sub>/TEND<sub>0</sub>**

At reset, PA<sub>2</sub>/CKA<sub>1</sub>/TEND<sub>0</sub> is configured as a port A input. The function of this pin depends on the combination of bit 2 in the port A disable register (DERA2) and the CKA1D bit in the ASCI control register channel 1 (table 5).

**Table 5. PA<sub>2</sub>/CKA<sub>1</sub>/TEND<sub>0</sub> State**

<b>DERA2</b>	<b>CKA1D</b>	<b>Pin Function</b>
0	0, 1	PA <sub>2</sub>
1	0	CKA <sub>1</sub>
	1	TEND <sub>0</sub>

**PA<sub>4</sub>/RXS/CTS<sub>1</sub>**

At reset, PA<sub>4</sub>/RXS/CTS<sub>1</sub> is configured as a port A input. The function of this pin depends on the combination of bit 4 in the port A disable register (DERA4) and the CTS1E bit in the ASCI status register channel 1 (table 6).

**Table 6. PA<sub>4</sub>/RXS/CTS<sub>1</sub> State**

DERA4	CTS1E	Pin Function
0	0, 1	PA <sub>4</sub>
1	0	RXS
	1	CTS <sub>1</sub>

**CKA<sub>0</sub>/DREQ<sub>0</sub>**

CKA<sub>0</sub>/DREQ<sub>0</sub> is configured as the CKA<sub>0</sub> at reset. When either the DM1 or SM1 bit of the DMA mode registers 1, this bit is forcibly configured as the DREQ<sub>0</sub> input, even if it has been configured as an output pin.

**PG<sub>0</sub>/AN<sub>0</sub>, PG<sub>1</sub>/AN<sub>1</sub>, PG<sub>2</sub>/AN<sub>2</sub>, PG<sub>3</sub>/AN<sub>3</sub>, PG<sub>4</sub>/AN<sub>4</sub>, PG<sub>5</sub>/AN<sub>5</sub>**

These pins cannot be configured as parallel port input pins (TTL-level input pins) alternate with analog comparator input pins. When using these pins as a TTL input port, read the port G input data register (IDRG).

When using these pins as an analog comparator's channel input, read the comparator control/status register (CCSR).

## ■ Absolute Maximum Ratings

Item	Symbol	Value	Unit
Supply Voltage	V <sub>CC</sub>	-0.3 to +7.0	V
Input Voltage	V <sub>in</sub>	-0.3 to V <sub>CC</sub> +0.3	V
Operating Temperature	T <sub>opr</sub>	-20 to +75	°C
Storage Temperature	T <sub>stg</sub>	-55 to +150	°C

Note: Permanent LSI damage may occur if maximum ratings are exceeded. Normal operation should be under recommended operating conditions. If these conditions are exceeded, it could effect reliability of LSI.

Storage Temperature of the HD647180X is T<sub>stg</sub> = -55 ~ +125°C.

## ■ ELECTRICAL CHARACTERISTICS

- DC Characteristics (V<sub>CC</sub> = 5V ± 10%, V<sub>SS</sub> = 0V, Ta = -20 to +75°C, unless otherwise noted)

Symbol	Item	Min	Typ	Max	Unit	Condition
V <sub>IH1</sub>	Input High Voltage RESET, EXTAL, NMI	V <sub>CC</sub> -0.6	-	V <sub>CC</sub> +0.3	V	
V <sub>IH2</sub>	Input High Voltage Except RESET, EXTAL, NMI	2.0	-	V <sub>CC</sub> +0.3	V	
V <sub>IL1</sub>	Input Low Voltage RESET, EXTAL, NMI	-0.3	-	0.6	V	
V <sub>IL2</sub>	Input Low Voltage Except RESET, EXTAL, NMI	-0.3	-	0.8	V	
V <sub>OH</sub>	Output High Voltage All outputs	2.4	-	-	V	I <sub>OH</sub> = -200 μA
		V <sub>CC</sub> -1.2	-	-		I <sub>OH</sub> = -20 μA
V <sub>OL</sub>	Output Low Voltage All Outputs	-	-	0.45	V	I <sub>OL</sub> = 2.2 mA
I <sub>L</sub>	Input Leakage Current All Inputs Except XTAL, EXTAL, RESET	-	-	1.0	μA	V <sub>in</sub> =0.5 to V <sub>CC</sub> -0.5 V
I <sub>TL</sub>	Three State Leakage Current	-	-	1.0	μA	V <sub>in</sub> =0.5 to V <sub>CC</sub> -0.5 V
I <sub>CC</sub> (Note)	Power Dissipation (Normal Operation)	-	20	40	mA	f = 4 MHz
		-	25	50		f = 6 MHz
		-	30	60		f = 8 MHz
	Power Dissipation (System Stop Mode)	-	5	10	mA	f = 4 MHz
		-	6.3	12.5		f = 6 MHz
		-	7.5	15		f = 8 MHz
C <sub>P</sub>	Pin Capacitance	RESET Except RESET	-	120 20	pF	V <sub>in</sub> =0V, f=1 MHz Ta=25°C

Note: V<sub>iHmin</sub> = V<sub>CC</sub> - 1.0 V, V<sub>ilmax</sub> = 0.8 V (All input pins except RESET, EXTAL, NMI)  
 V<sub>iHmin</sub> = V<sub>CC</sub> - 0.6 V, V<sub>ilmax</sub> = 0.6 V (RESET, EXTAL, NMI)  
 (all output terminals are at no load.)

The HD643180X differs from HD647180X in chip design and manufacturing process. Be careful when using the HD647180X system for the HD643180X since characteristics values are not exactly the same though guaranteed values are identical.

## ■ INSTRUCTION SET

### Register

**g, g', ww, xx, yy, and zz** specify a register to be used. **g** and **g'** specify an 8-bit register. **ww, xx, yy, and zz** specify a 16-bit pair of 8-bit registers. Table 7 shows the correspondence between symbols and registers.

**Table 7 Register Specification**

<b>g,g'</b>	<b>Reg.</b>	<b>ww</b>	<b>Reg.</b>	<b>xx</b>	<b>Reg.</b>	<b>yy</b>	<b>Reg.</b>	<b>zz</b>	<b>Reg.</b>
000	B	00	BC	00	BC	00	BC	00	BC
001	C	01	DE	01	DE	01	DE	01	DE
010	D	10	HL	10	IX	10	IY	10	HL
011	E	11	SP	11	SP	11	SP	11	AF
100	H								
101	L								
111	A								

Note: H and L suffixed to ww,xx,yy,zz (ex. wwH, IXL) indicate upper and lower 8 bits of the 16-bit register, respectively.

### Bit

**b** specifies a bit to be manipulated in the bit manipulation instruction. Table 8 shows the correspondence between b and bits.

**Table 8 Bit Specification**

<b>b</b>	<b>Bit</b>
000	0
001	1
010	2
011	3
100	4
101	5
110	6
111	7

### Condition

**f** specifies the condition in program control instructions. Table 9 shows the correspondence between f and conditions.

**Table 9 Condition Specification**

<b>f</b>	<b>Condition</b>	
000	NZ	non zero
001	Z	zero
010	NC	non carry
011	C	carry
100	PO	parity odd
101	PE	parity even
110	P	sign plus
111	M	sign minus

**Restart Address**

v specifies a restart address. Table A-4 shows the correspondence between v and restart addresses.

**Table 10 Restart Address Specification**

<b>v</b>	<b>Address</b>
000	00H
001	08H
010	10H
011	18H
100	20H
101	28H
110	30H
111	38H

**Flag**

The following symbols show the flag conditions:

- : not affected
- ↑ : affected
- × : undefined
- S : set to 1
- R : reset to 0
- P : parity
- V : overflow

**Miscellaneous**

(      )<sub>M</sub> : Data in the memory address  
(      )<sub>I</sub> : Data in the I/O address  
m or n : 8-bit data  
mn : 16-bit data  
r : 8-bit register  
R : 16-bit register  
b·(      )<sub>M</sub> : Contents of bit b in the memory address  
b·gr : Contents of bit b in the register gr  
d or j : 8-bit signed displacement  
S : Source addressing mode  
D : Destination addressing mode  
· : AND operation  
+ : OR operation  
+ : EXCLUSIVE OR operation  
\*\* : Added new instructions to Z80

## ■ OPCODE MAP

**Table 22 First Opcode Map**

**Instruction format: XX**

ww(Lo = All)								Lo = 0 - 7								
BC		DE		HL		SP		BC		DE		HL		AF		
g (Lo = 0 - 7)																
	B	D	H	(HL)	B	D	H	(HL)								
	0000	0001	0010	0011	0100	0101	0110	0111	1000	1001	1010	1011	1100	1101	1110	
	0	1	2	3	4	5	6	7	8	9	A	B	C	D	E	
	F															
S (Hl = All)	B	0000	0	NOP	DNZ	JR NZ	JR NC									
	C	0001	1	LD	ww, mn											
	D	0010	2	LD	(ww), A	LD(mn)	LD(mn), HL	A								
	E	0011	3	INC	ww											
	H	0100	4	INC	g											
	L	0101	5	DEC	g											
	(HL)	0110	6	LD	g, m											
	A	0111	7	RLCA	RLA	DAA	SCF									
	B	1000	8	EXAF	AF	JR J	JR Z	JR C								
	C	1001	9	ADD	HL	ww										
	D	1010	A	LD	A,	(ww)	LD HL	LD A, (mn)								
	E	1011	B	DEC	ww											
	H	1100	C	INC	g											
	L	1101	D	DEC	g											
	(HL)	1110	E	LD	g, m											
	A	1111	F	RRCA	RRA	CPL	CCF									
				0	1	2	3	4	5	6	7	8	9	A	B	
				C	E	L	A	C	E	L	A					
				g (Lo = 8 - F)												

- Notes:
1. (HL) replaces g.
  2. (HL) replaces s.
  3. If DDH is added as first opcode for the instructions which have HL or (HL) as an operand in table 1, the instructions are executed replacing HL with IX and (HL) with (IX + d).

ex: 22H: LD (mn), HL

DDH 22H: LD (mn), IX

If FDH is added as first opcode for the instructions which have HL or (HL) as an operand in table 1, the instructions are executed replacing HL with IY and (HL) with (IY + d).

ex: 34H: INC (HL)

FDH 34H: INC (IY + d)

However, JP (HL) and EX DE, HL are exceptions. Note the followings:

If DDH is added as first opcode for JP (HL), (IX) replaces (HL) as operand and JP (IX) is executed.

If FDH is added as first opcode for JP (HL), (IY) replaces (HL) as operand and JP (IY) is executed.

Even if DDH or FDH is added as first opcode for EX DE, HL, HL is not replaced and the instruction is regarded as illegal.

## ■ OPERATING MODES

### Request Acceptance in Each Operating Mode

**Table 25 Request Acceptance**

Request	Normal Operation (CPU mode) (I/O Stop mode)	Wait State	Refresh Cycle	Interrupt Acknowledge Cycle	DMA Cycle	Bus Release Mode	Sleep mode	System Stop Mode
<b>WAIT</b>	Accepted	Accepted	Not accepted	Accepted	Accepted	Not accepted	Not accepted	Not accepted
Refresh Request (Request of the on-chip Refresh Controller)	Refresh cycle begins at the end of MC	Not accepted	Not accepted	Refresh cycle begins at the end of MC	Refresh cycle begins at the end of MC	Not accepted	Not accepted	Not accepted
DREQ0, DREQ1,	DMA cycle begins at the end of MC	DMA cycle begins at the end of MC	Accepted	Accepted	Accepted	Accepted	Not accepted	Not accepted
			If refresh cycle precedes: DMA cycle begins at the end of one MC	If refresh cycle begins at the end of MC	Refer to Section 10 "DMA Controller" for details.	. After bus release DMA cycle, DMA cycle begins at the end of one MC		
<b>BUSREQ</b>	Bus is released at the end of MC	Not accepted	Not accepted	Bus is released at the end of MC	Bus is released at the end of MC	Continue bus release mode.	Accepted	Accepted
Interrupt	<b>INT0, INT1,</b> <b>INT2,</b> Internal I/O Interrupt	Accepted after executing the current instruction.	Accepted after executing the current instruction.	Not accepted	Not accepted	Not accepted	Accepted	Accepted
						Return from sleep mode to normal operation.	Return from system stop mode to normal operation.	Return from system stop mode to normal operation.
<b>NMI</b>	Accepted after executing the current instruction.	Accepted after executing the current instruction.	Accepted after executing the current instruction.	Not accepted	Not accepted	Not accepted	Accepted	Accepted
						Return from sleep mode to normal operation.	Return from system stop mode to normal operation.	Return from system stop mode to normal operation.

Notes : \* not acceptable when DMA Request is in level sense.

MC: Machine Cycle

**Request Priority**

The HD643180X/HD647180X has the following three types of requests.

**Type 1:** To be accepted in specified state ..... WAIT

**Type 2:** To be accepted in each machine cycle ..... Refresh Req.  
DMA Req.  
Bus Req.

**Type 3:** To be accepted in each instruction ..... Interrupt Req.

Type 1, type 2, and type 3 request priority is as follows:

Highest priority Type 1 > Type 2 > Type 3 Lowest priority

Type 2 request priority is as follows:

Highest priority Bus Req. > Refresh Req. > DMA Req. Lowest priority

Note : If Bus Req. and Refresh Req. occurs simultaneously, Bus Req. is accepted.

Refer to "Section 8, Interrupts" for type 3 request priority.

**Type 4:** To be accepted in last machine cycle

Highest priority Bus Req. from Bus masters > Interrupt Req.

## Operation Mode Transition

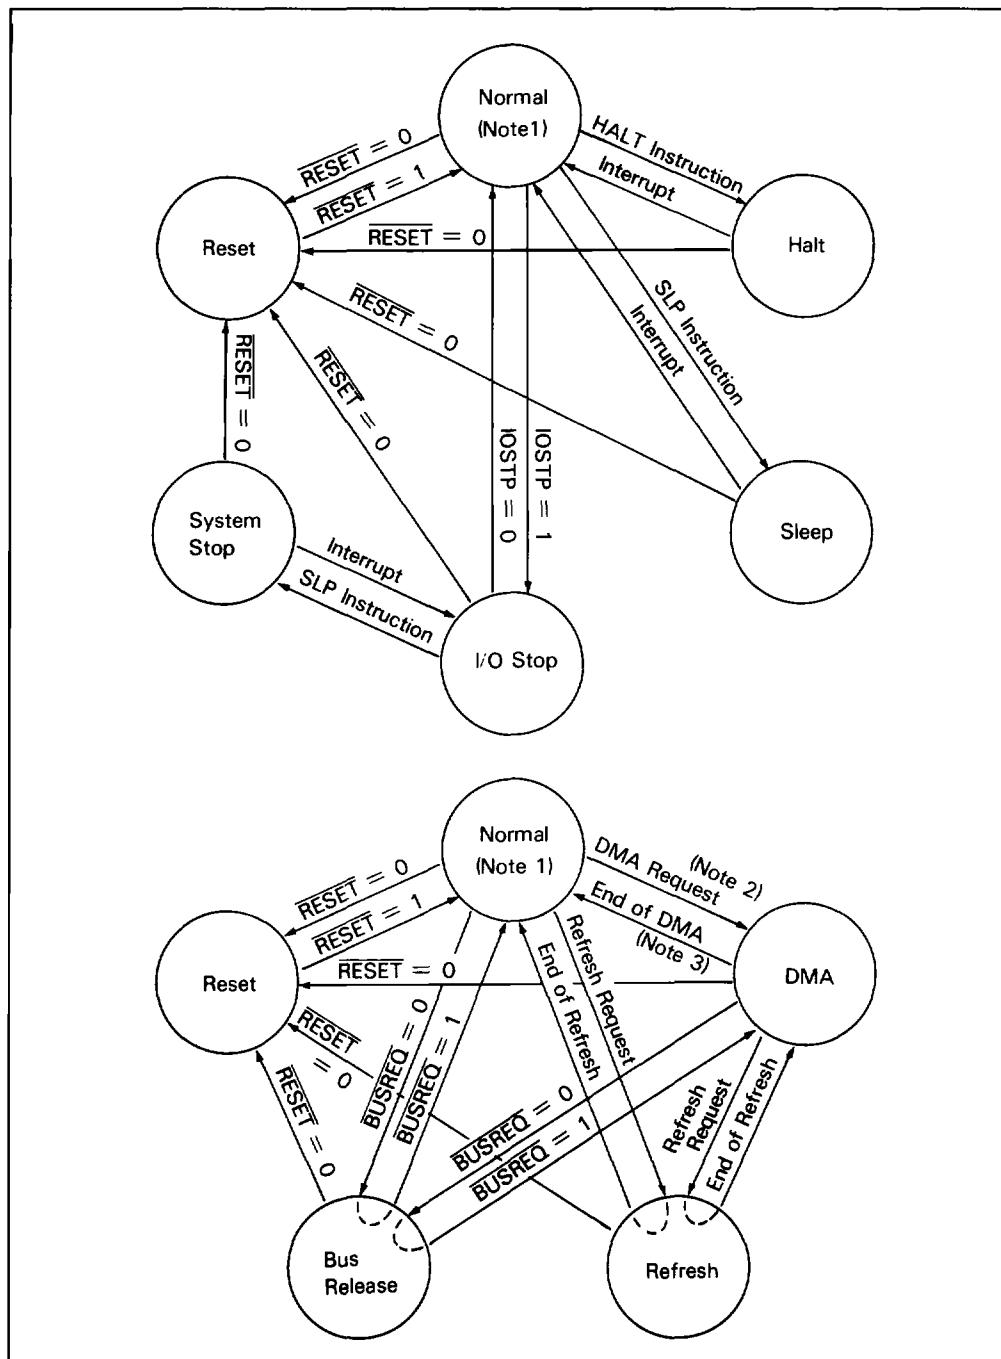

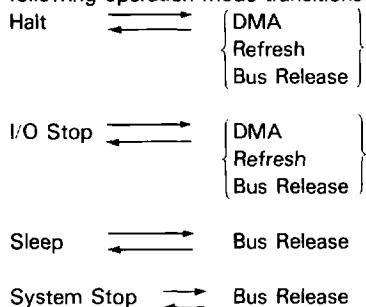

Figure 19. Operation Mode Transitions

- Notes :
1. Normal: CPU executes instructions normally in normal mode.
  2. DMA request: DMA is requested in the following cases.
    - (1)  $\overline{DREQ_0}, \overline{DREQ_1} = 0$  (memory to/from (memory-mapped) I/O DMA transfer)
    - (2)  $DE0 = 1$  (memory to/from memory DMA transfer)
  3. DMA end: DMA ends in the following cases.
    - (1)  $\overline{DREQ_0}, \overline{DREQ_1} = 1$  (memory to/from (memory-mapped) I/O DMA transfer)
    - (2)  $BCR0, BCR1 = 0000H$  (all DMA transfers)
    - (3)  $\overline{NMI} = 0$  (all DMA transfers)

The following operation mode transitions are also possible.

**Status Signals**

Table 26. shows pin outputs in each operating mode.

**Table 26 Pin Outputs**

Mode		LIR	ME	IOE	RD	WR	REF	HALT	BUSACK	ST	Address Bus	Data Bus
CPU operation	Opcode Fetch (1st opcode)	0	0	1	0	1	1	1	1	0	A	In
	Opcode Fetch (except 1st opcode)	0	0	1	0	1	1	1	1	1	A	In
	Memory Read	1	0	1	0	1	1	1	1	1	A	In
	Memory Write	1	0	1	1	0	1	1	1	1	A	Out
	I/O Read	1	1	0	0	1	1	1	1	1	A	In
	I/O Write	1	1	0	1	0	1	1	1	1	A	Out
	Internal Operation	1	1	1	1	1	1	1	1	1	A	In
Refresh		1	0	1	1	1	0	1	1	*	A	In
Interrupt	NMI	0	0	1	0	1	1	1	1	0	A	In
Acknow- ledge Cycle (1st machine cycle)	INT <sub>0</sub>	0	1	0	1	1	1	1	1	0	A	In
	INT <sub>1</sub> , INT <sub>2</sub> & Internal Interrupts	1	1	1	1	1	1	1	1	0	A	In
Bus Release		1	Z	Z	Z	Z	1	1	0	*	Z	In
Halt		0	0	1	0	1	1	0	1	0	A	In
Sleep		1	1	1	1	1	1	0	1	1	1	In
Internal DMA	Memory Read	1	0	1	0	1	1	*	1	0	A	IN
	Memory Write	1	0	1	1	0	1	*	1	0	A	Out
	I/O Read	1	1	0	0	1	1	*	1	0	A	In
	I/O Write	1	1	0	1	0	1	*	1	0	A	Out
Reset		1	1	1	1	1	1	1	1	1	Z	In

Note 1 : High

0 : Low

A : Programmable

Z : High Impedance

In : Input

Out : Output

\* : Invalid

## ■ INTERNAL I/O REGISTERS

By programming IOA7 in the I/O control register, internal I/O register addresses are relocatable within ranges from 0000H to 00FFH in the I/O address space.

Register	Mnemonic	Address	Remarks								
ASCI Control Register A Channel 0 (CNTLA0)		0 0	bit	MPE	RE	TE	RTSO	MPBR/ EFR	MOD2	MOD1	MODO
			During reset	0	0	0	1	invalid	0	0	0
