Attention please!

The information herein is given to describe certain components and shall not be considered as warranted characteristics.

Terms of delivery and rights to technical change reserved.

We hereby disclaim any and all warranties, including but not limited to warranties of non-infringement, regarding circuits, descriptions and charts stated herein.

Infineon Technologies is an approved CECC manufacturer.

Information

For further information on technology, delivery terms and conditions and prices please contact your nearest Infineon Technologies Office in Germany or our Infineon Technologies Representatives worldwide (see address list).

Warnings

Due to technical requirements components may contain dangerous substances. For information on the types in question please contact your nearest Infineon Technologies Office.

Infineon Technologies Components may only be used in life-support devices or systems with the express written approval of Infineon Technologies, if a failure of such components can reasonably be expected to cause the failure of that life-support device or system, or to affect the safety or effectiveness of that device or system. Life support devices or systems are intended to be implanted in the human body, or to support and/or maintain and sustain and/or protect human life. If they fail, it is reasonable to assume that the health of the user or other persons may be endangered.

8-Bit Single-Chip Microcontroller C800 Family

C868

C868

Advance Information

- C800 core :
 - Fully compatible to standard 8051 microcontroller
 - Superset of the 8051 architecture with 8 datapointers
- 6.25 - 40 MHz internal system clock (built-in PLL with software configurable divider)
 - external clock of 6.67 - 10.67 MHz
 - 300ns instruction cycle time (@40 MHz system clock)
- 8 Kbyte on-chip Program ROM for C868-1R and 8 KByte on-chip Program RAM for C868-1S
- In-system programming support for programming the XRAM(C868-1R) or XRAM/Program RAM(C868-1S)
 - This feature is realized through 4KB Boot ROM
- 256 byte on-chip RAM
- 256 byte on-chip XRAM

(further features are on the next page)

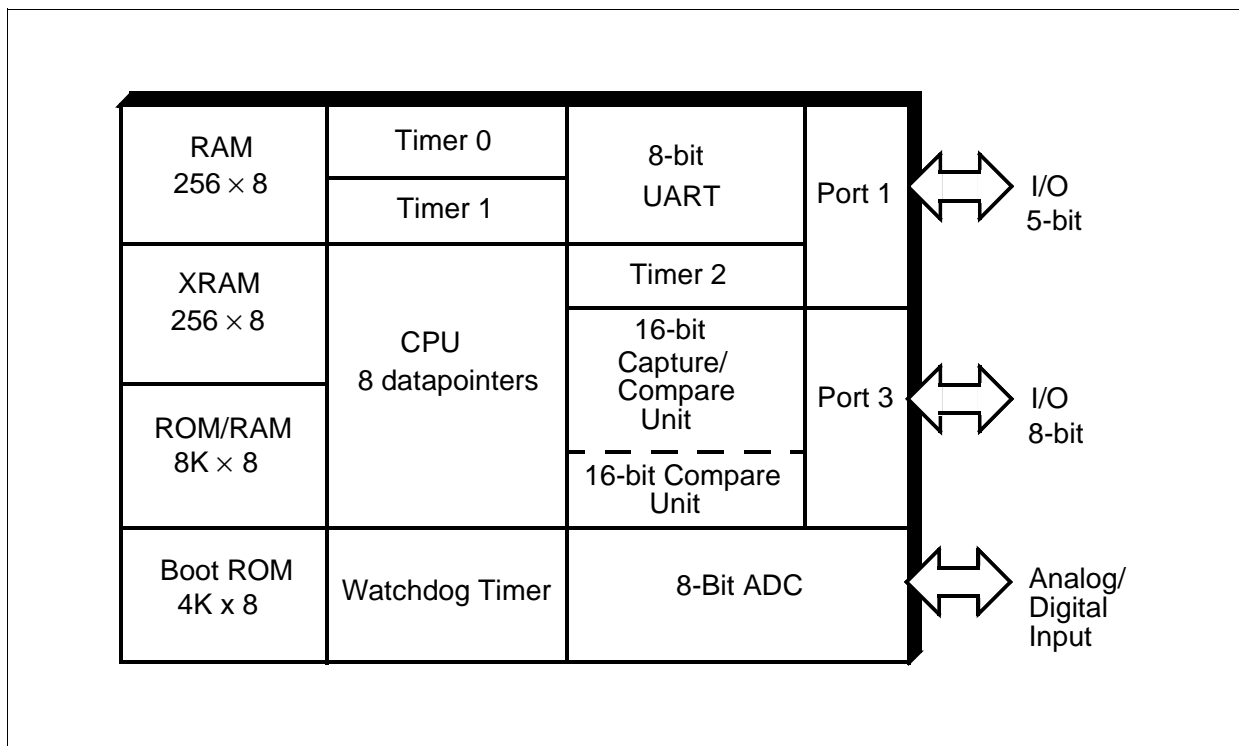

Figure 1 C868 Functional Units

- One 8-bit and one 5 bits general purpose push-pull I/O ports
 - Enhanced sink current of 10 mA on Port 1/3 (total sink current of 46 mA @ 100°C)
- Three 16-bit timers/counters
 - Timer 0 / 1
 - Timer/counter 2 (up/down counter feature)
 - Timer 1 or 2 can be used for serial baudrate generator
- Capture/compare unit for PWM signal generation
 - 3-channel, 16-bit capture/compare unit
 - 1-channel, 16-bit compare unit
- Full duplex serial interface (UART)
- 5 channel 8-bit A/D Converter
- 13 interrupt vectors with 2 priority levels
- Programmable 16-bit Watchdog Timer
- Brown out detection
- Power Saving Modes
 - Slow-down mode
 - Idle mode (can be combined with slow-down mode)
 - Power-down mode with wake up capability through $\overline{\text{INT0}}$ or RxD pins.
- Individual power-down control for timer/counter 2, capture/compare unit and A/D converter.
- P-DSO-28-1, P-TSSOP-38-1 packages
- Temperature ranges:
 - SAB-C868-1RR, SAB-C868-1SR, SAB-C868-1RG, SAB-C868-1SG $T_A = 0$ to 70 °C
 - SAF-C868-1RR, SAF-C868-1SR, SAF-C868-1RG, SAF-C868-1SG $T_A = -40$ to 85 °C

Figure 5 Block Diagram of the C868

CPU

The C868 is efficient both as a controller and as an arithmetic processor. It has extensive facilities for binary and BCD arithmetic and excels in its bit-handling capabilities. Efficient use of program memory results from an instruction set consisting of 44% one-byte, 41% two-byte, and 15% three-byte instructions. With a 10.67 MHz external crystal (giving a 40MHz CPU clock), 58% of the instructions execute in 300 ns.

CY	7	rwh	Carry Flag Used by arithmetic instructions.															

Memory Organization

The C868 CPU manipulates operands in the following five address spaces:

- up to 8 Kbyte of RAM internal program memory : 8K ROM for C868-1R
: 8K RAM for C868-1S
- 4 Kbyte of internal Self test and Boot ROM
- 256 bytes of internal data memory
- 256 bytes of internal XRAM data memory
- 128 byte special function register area

Figure 0-1 illustrates the memory address spaces of the C868.

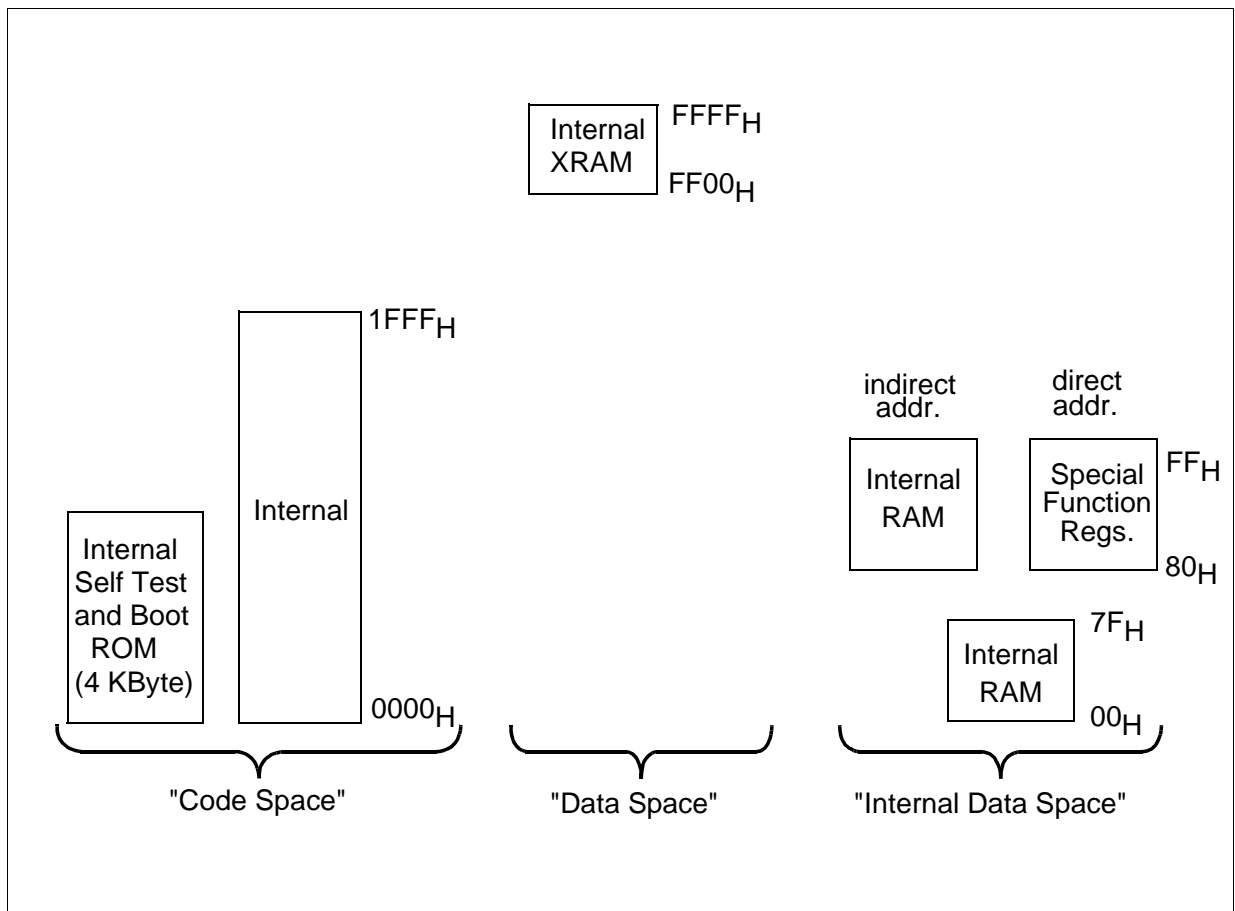

Figure 0-1 C868 Memory Map

The various chip modes supported are shown in **Figure 6**.

Figure 6 Entry and exit of Chip Modes

A valid hardware reset would, of course, override any of the above entry or exit procedures.

Table 0-1 Hardware and Software Selection of Chipmodes

Operating Mode (Chipmode)	Hardware Selection	Software Selection
Normal Mode	ALE/BSL pin = high $\overline{\text{RESET}}$ rising edge	ALE/BSL = don't care; setting bits BSLEN, SWAP = 0,0; execute unlocking sequence
Normal XRAM Mode	Not possible	setting bits BSLEN, SWAP = 0,1; execute unlocking sequence
Bootstrap XRAM Mode	Not possible	setting bits BSLEN, SWAP = 1,1; execute unlocking sequence
Bootstrap Mode	ALE/BSL pin = low $\overline{\text{RESET}}$ rising edge	ALE/BSL = don't care; setting bits BSLEN, SWAP = 1,0; execute unlocking sequence

Table 3 Normal Memory Configuration

Chip Mode	Memory Space	Memory Boundary
Normal	Code Space	ROM/RAM: 0000 _H to 1FFF _H
	Internal Data Space	XRAM: FF00 _H to FFFF _H
Bootstrap	Code Space	Boot ROM: 0000 _H to 0FFF _H
	Internal Data Space	XRAM: FF00 _H to FFFF _H ROM/RAM: 0000 _H to 1FFF _H
Normal XRAM	Code Space	XRAM: FF00 _H to FFFF _H
	Data Space	ROM/RAM: 0000 _H to 1FFF _H
Bootstrap XRAM	Code Space	Boot ROM: 0000 _H to 0FFF _H XRAM: FF00 _H to FFFF _H
	Data Space	ROM/RAM: 0000 _H to 1FFF _H

Bootstrap loader

The C868, includes a bootstrap mode, which is activated by setting the ALE/BSL pin at logic low with a pulldown and TxD pin at logic high with a pullup at the rising edge of the $\overline{\text{RESET}}$. Or it can be entered by software, that is by setting BLEN bit and resetting SWAP bit in SFR SYSCON1 accompany by an unlock sequence.

In the bootstrap mode, software routines of the bootstrap loader located in the boot ROM will be executed. Its purpose is to allow the easy and quick programming of the internal SRAM (0000_H to 1FFF_H) or XRAM (FF00_H to FFFF_H) via serial interface (UART) while the MCU is in-circuit. It also provides a way to program SRAM or XRAM through bootstrapping from an external SPI EEPROM.

The first action of the bootstrap loader is to check the first byte of serial EEPROM. If the first byte is 0A5_H, the MCU would enter Phase A to download from the EEPROM. Otherwise, it will enter Phase B to establish a serial communication with the connected host. Bootstrapping from the serial EEPROM can also be done in phase B if it is invoked by the host.

Phase B consists of two functional parts that represent two phases:

- Phase I: Establish a serial connection and automatically synchronize to the transfer speed (baud rate) of the serial communication partner (host).
- Phase II: Perform the serial communication with the host. The host controls the communication by sending special header information, which select one of the working modes. These modes are:

Table 4 Serial Communication Modes of Phase B

Modes	Description
0	Transfer a customer program from the host to the SRAM (0000 _H to 1FFF _H) or XRAM (FF00 _H -FFFF _H). Then return to the beginning of phase II and wait for the next command from the host.
1	Execute a customer program in the XRAM at start address FF00 _H .
2	Execute a customer program in the SRAM at start address 0000 _H .
3	Transfer a customer program from the EEPROM to the SRAM (0000 _H to 1FFF _H) or XRAM (FF00 _H -FFFF _H). Then return to the beginning of phase II and wait for the next command from the host.
4-9	reserved

The phases of the bootstrap loader are illustrated in [Figure 7](#).

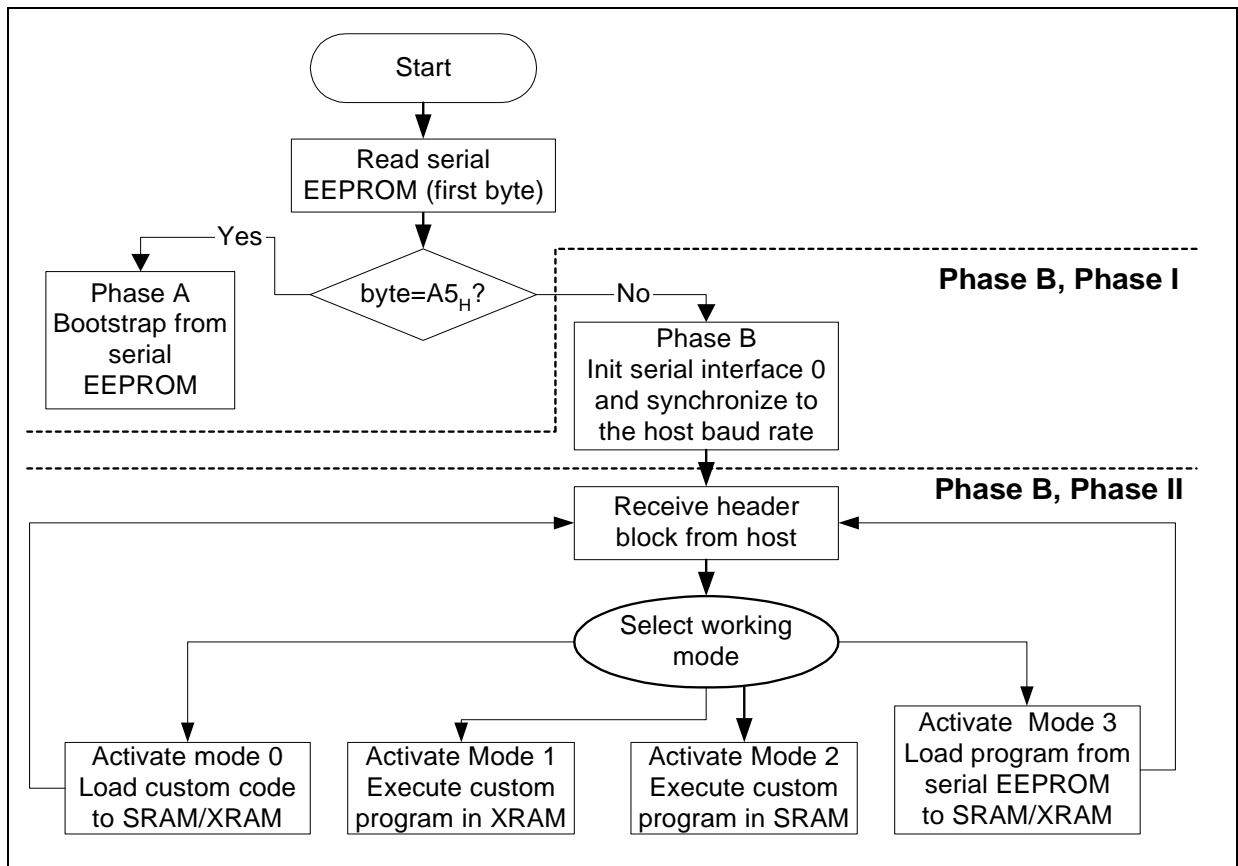

Figure 7 The phases of the Bootstrap Loader

The serial communication is activated in phase B. Using a full duplex serial cable (RS232), the MCU must be connected to the serial port of the host computer as shown in [Figure 8](#).

Figure 8 Bootstrap Loader Interface to the PC

Reset and Brownout

The reset input is an active low input. An internal Schmitt trigger is used at the input for noise rejection. The $\overline{\text{RESET}}$ pin must be held low for at least t_{bd} usec. But the CPU will only exit from reset condition after the PLL lock had been detected.

During $\overline{\text{RESET}}$ at transition from low to high, C868 will go into normal mode if ALE/BSL is high and bootstrap loading mode if ALE/BSL is low. A pullup to V_{DDP} or pulldown to ground is recommended for pin ALE/BSL. TXD should have a pullup to V_{DDP} and should not be stimulated externally during reset, as a logic low at this pin will cause the chip to go into test mode if ALE/BSL is low.

Figure 9 shows the possible reset circuits, note that the $\overline{\text{RESET}}$ pin does not have an internal pullup resistance.

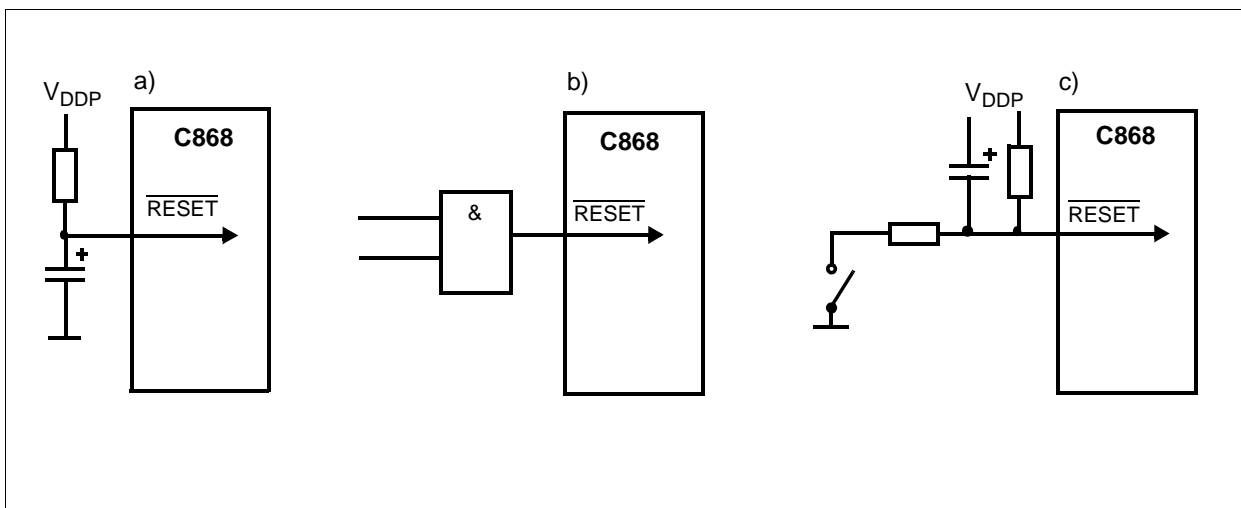

Figure 9 Reset Circuitries

An on-chip analog circuit detects brownout, if the supply voltage V_{DDC} dips below the threshold voltage $V_{\text{THRESHOLD}}$ momentarily while $\overline{\text{RESET}}$ pin is high. If this detection is active for t_{bd} usec then the device will reset. When supply voltage V_{DDC} recovers by exceeding $V_{\text{THRESHOLD}}$ while $\overline{\text{RESET}}$ is high, the reset is released once PLL is locked for 4096 clocks. Bit BO in the PMCON0 register is set when brownout detected if brownout detection was enabled, this bit is cleared by hardware reset $\overline{\text{RESET}}$ and software. All ports are tristated during brownout.

The $V_{\text{THRESHOLD}}$ has a nominal value of 1.47V, a minimum value of 1.1V and a maximum value of 1.8V.

Clock system

The C868 clock system consist of the on-chip oscillator, PLL and multiplexer stage. The programmable Slow Down Divider (SDD) divides the PLL output clock frequency by a factor of 1...32 which is specified via CMCON.REL. The system clock is switched from the PLL output to the output from the SDD when slowdown mode is selected.

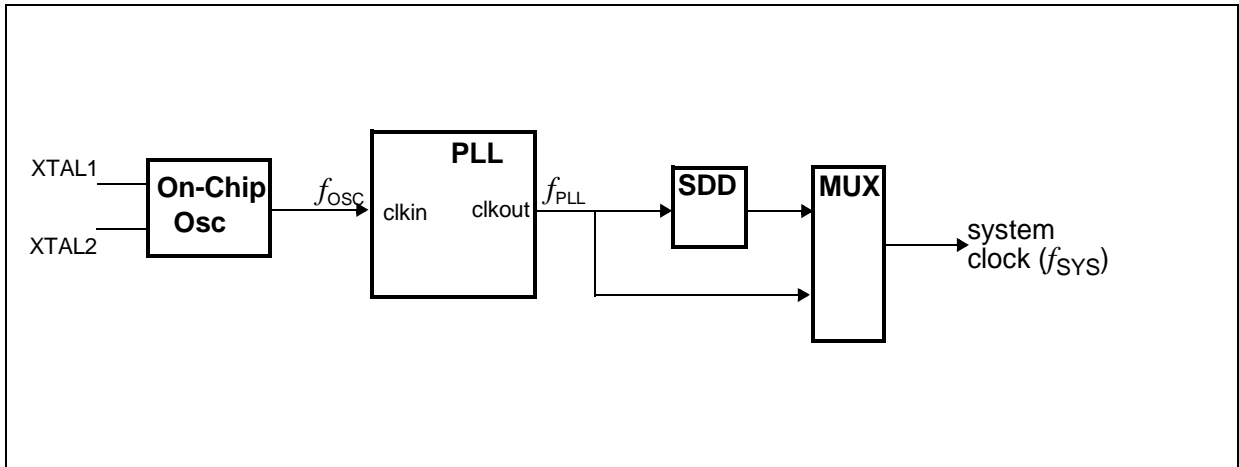

Figure 10 Block Diagram of the Clock Generation

The PLL output frequency is determined by:

$$f_{PLL} = f_{VCO} / K = \frac{15}{K} \times f_{OSC} \quad [1]$$

The range for the VCO frequency is given by:

$$100 \text{ MHz} \leq f_{VCO} \leq 160 \text{ MHz} \quad [2]$$

The relationship between the input frequency and VCO frequency is given by:

$$f_{VCO} = 15 \times f_{OSC} \quad [3]$$

This gives the range for the input frequency which is given by:

$$6.67 \text{ MHz} \leq f_{OSC} \leq 10.67 \text{ MHz} \quad [4]$$

Table 5 Output Frequencies f_{PLL} Derived from Various Output Factors

K-Factor		f_{PLL}		Duty Cycle [%]	Jitter
Selected Factor	KDIV	$f_{VCO} = 100 \text{ MHz}$	$f_{VCO} = 160 \text{ MHz}$		
2	000 _B	50	80	50	linear depending on f_{VCO} at $f_{VCO} = 100\text{MHz}$: +/-300ps at $f_{VCO} = 160\text{MHz}$: +/-250ps additional jitter for odd Kdiv factors tbd.
4	010 _B	25	40	50	
5 ¹⁾	011 _B	20	32	40	
6	100 _B	16.67	26.67	50	
8	101 _B	12.5	20	50	
9 ¹⁾	110 _B	11.11	17.78	44	
10	111 _B	10	16	50	
16	001 _B	6.25	10	50	

1) These odd factors should not be used (not tested because off the unsymmetrical duty cycle).

2) Shaded combinations should not be used because they are above the maximum CPU frequency of 40MHz.

Figure 11 shows the recommended oscillator circuitries for crystal and external clock operation.

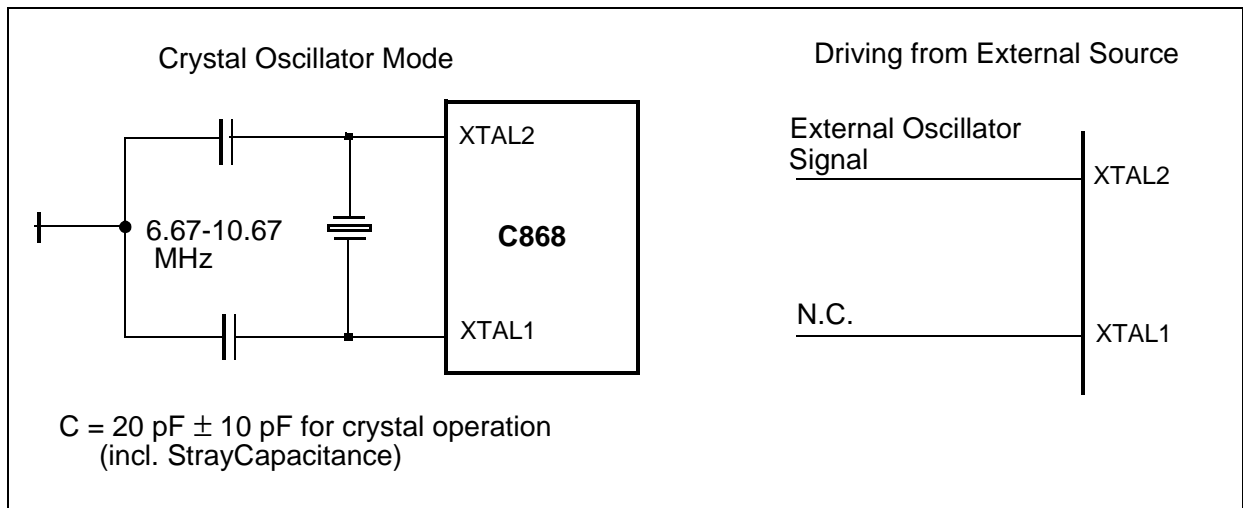

Figure 11 Recommended Oscillator Circuit

In this application the on-chip oscillator is used as a crystal-controlled, positive-reactance oscillator (a more detailed schematic is given in [Figure 12](#)). It is operated in its fundamental response mode as an inductive reactor in parallel resonance with a capacitor external to the chip. The crystal specifications and capacitances are non-critical. In this circuit tbd pF can be used as single capacitance at any frequency together with a good quality crystal. A ceramic resonator can be used in place of the crystal in cost-critical applications. If a ceramic resonator is used, the two capacitors normally have different values depending on the oscillator frequency. We recommend consulting the manufacturer of the ceramic resonator for value specifications of these capacitors.

Figure 12 On-Chip Oscillator Circuitry

To drive the C868 with an external clock source, the external clock signal has to be applied to XTAL2, as shown in [Figure 13](#). XTAL1 has to be left unconnected. A pullup resistor is suggested (to increase the noise margin), but is optional if V_{OH} of the driving gate corresponds to the V_{IH2} specification of XTAL2.

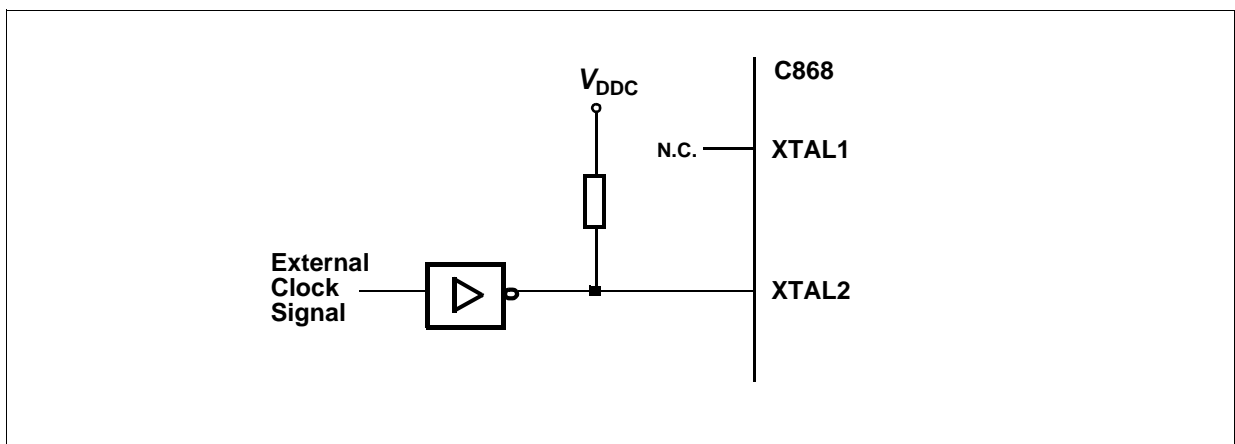

Figure 13 External Clock Source

0.1 Special Function Registers

All registers, except the program counter and the four general purpose register banks, reside in the special function register area. The special function register area consists of two portions: the standard special function register area and the mapped special function register area. For accessing the mapped special function area, bit RMAP in special function register SYSCON0 must be set. All other special function registers are located in the standard special function register area which is accessed when RMAP is cleared ("0").

SYSCON0

System Control Register 0

[Reset value: XX10XXX1_B]

7	6	5	4	3	2	1	0
-	-	EALE	RMAP	-	-	-	XMAP0
r	r	rw	rw	r	r	r	rw

The functions of the shaded bits are not described here

Field	Bits	Typ	Description
RMAP	4	rw	Special Function Register Map Control RMAP = 0 : The access to the non-mapped (standard) special function register area is enabled. RMAP = 1 : The access to the mapped special function register area is enabled.
-	[7:2]	r	reserved; returns '0' if read; should be written with '0';

As long as bit RMAP is set, the mapped special function register area can be accessed. This bit is not cleared automatically by hardware. Thus, when non-mapped/mapped registers are to be accessed, the bit RMAP must be cleared/set respectively by software.

The 109 special function registers (SFR) include pointers and registers that provide an interface between the CPU and the other on-chip peripherals. All available SFRs whose address bits 0-2 are 0 (e.g. 80_H, 88_H, 90_H, ..., F0_H, F8_H) are bit-addressable. Totally there are 128 directly addressable bits within the SFR area.

All SFRs are listed in [Table 6](#) and [Table 7](#).

In [Table 6](#) they are organized in groups which refer to the functional blocks of the C868-1R, C868-1S. [Table 7](#) illustrates the contents (bits) of the SFRs

3) This register is mapped with RMAP (SYSCON0.4)=1

Shaded registers are bit-addressable special function registers

Ports

The C868 has two kinds of ports. The first kind is push-pull ports instead of the traditional quasi-bidirectional ports. The ports belonging to this kind is port 1 which is a 5-bit I/O port and port 3 which is an eight-bit I/O port. When configured as inputs, these ports will be high impedance with Schmitt trigger feature. Port 3 is alternate for capture/compare functions whereas, port 1 has alternate functions for some of the pins.

The second kind is dedicated ports which are shared by the interrupts, timer 2 inputs, capture/compare hall inputs and analog inputs.

Timer 0 and 1

Timer 0 and 1 can be used in four operating modes as listed in [Table 8](#):

Table 8 Timer 0 and 1 Operating Modes

Mode	Description	TMOD		System Clock
		M1	M0	
0	8-bit timer with a divide-by-32 prescaler	0	0	$f_{SYS}/(12*32)$
1	16-bit timer	0	1	$f_{SYS}/12$
2	8-bit timer with 8-bit autoreload	1	0	
3	Timer 0 used as one 8-bit timer and one 8-bit timer timer 1 stops	1	1	

The register is incremented every machine cycle. Since the machine cycle consist of twelve oscillator periods, the count rate is 1/12th of the system frequency. External inputs INT0 and INT1 can be programmed to function as a gate to facilitate pulse width measurements. [Figure 14](#) illustrates the input clock logic.

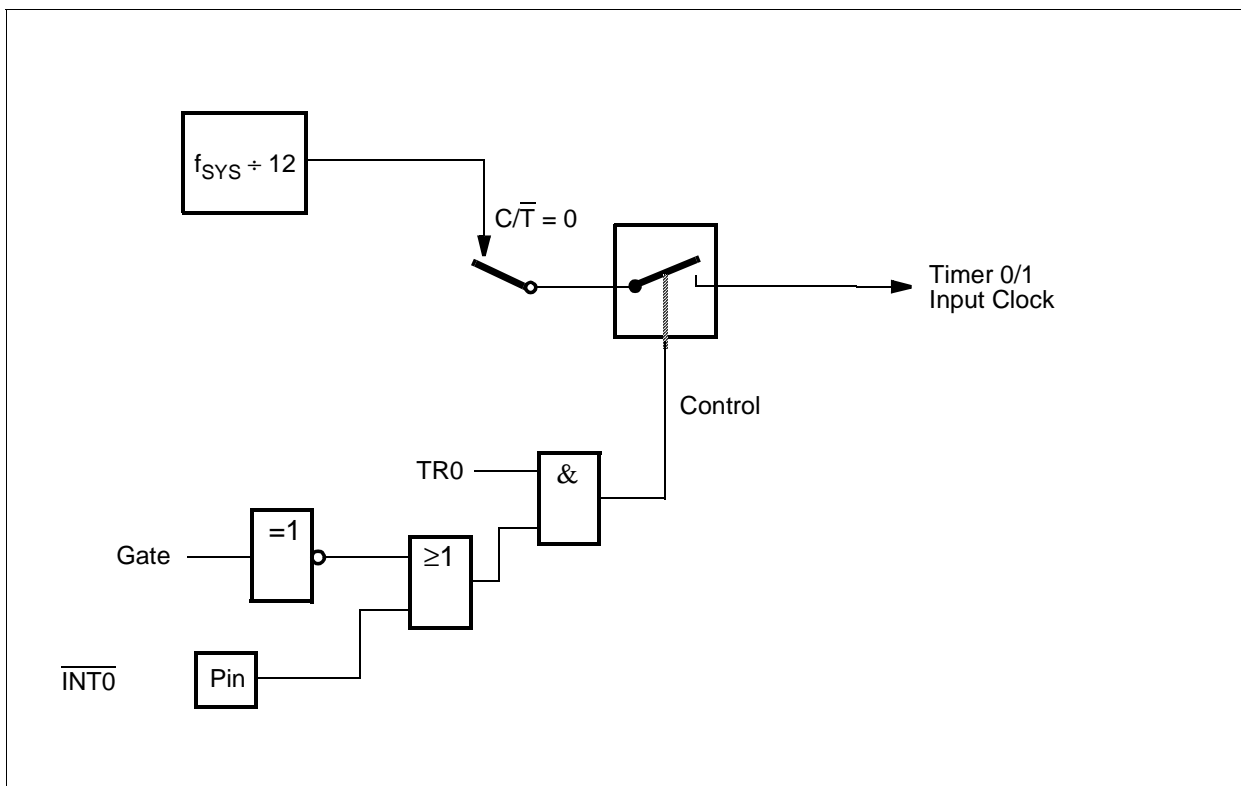

Figure 14 Timer 0 and 1 Input Clock Logic

Timer/Counter 2 with Compare/Capture/Capture

Timer 2 is a 16-bit timer/counter with an up/down count feature. It has three operating modes:

- 16-bit auto-reload mode (up or down counting)
- 16-bit capture mode
- Baudrate generator

Table 9 **Timer/Counter 2 Operating Modes**

Mode	T2CON			T2MOD	T2CON	T2EX	Remarks	System Clock	
	RCLK or TCLK	CP/ RL2	TR2	DCEN	EXEN			Internal	T2
16-bit Auto- reload	0	0	1	0	0	X	reload upon overflow	$f_{SYS}/12$	max $f_{SYS}/24$
	0	0	X	0	1	↓	reload trigger (falling edge)		
	0	0	1	1	X	0	down counting		
	0	0	1	1	X	1	up counting		
16-bit Capture	0	1	1	X	0	X	16-bit Timer/Counter (only up-counting)	$f_{SYS}/12$	max $f_{SYS}/24$
	0	1	1	X	1	↓	capture T2H,T2L-> RC2H,RC2L		
Baudrate Generator	1	X	1	X	0	X	no overflow interrupt request(TF2)	$f_{SYS}/2$	-
	1	X	1	X	1	↓	extra external interrupt ("Timer 2")		
off	X	X	0	X	X	X	Timer 2 stops	-	-

Note: ↓ denotes a falling edge

Serial Interface (UART)

The serial port is a full duplex port capable of simultaneous transmit and receive functions. It is also receive-buffered; it can commence reception of a second byte before a previously-received byte has been read from the receive register. The serial port can operate in 3 modes as illustrated in [Table 10](#).

Table 10 UART Operating Modes

Mode	SCON		Description
	SM1	SM0	
0	0	0	Reserved
1	0	1	8-bit UART, variable baudrate 10 bits are transmitted (through TxD) or received (RxD)
2	1	0	9-bit UART, fixed baudrate 11 bits are transmitted (through TxD) or received (RxD)
3	1	1	9-bit UART, variable baudrate Similar to mode 2, except for the variable baudrate.

For clarification, some terms regarding the difference between “baudrate clock” and “baudrate” should be mentioned.

The serial interface requires a clock rate which is 16 times the baudrate for internal synchronization. Therefore, the baudrate generators must provide a “baudrate clock” to the serial interface which divides it by 16, thereby resulting in the actual “baudrate”.

The baudrates in Mode 1 and 3 are determined by the timer overflow rate. These baudrates can be determined by Timer 1 or by Timer 2 or both (one for transmit, the other for receive).

Table 11 Serial Interface - Baud Rate Dependencies

Serial Interface Operating Modes	Active Control Bits		Baud Rate Calculation
	TCLK/RCLK	SMOD	
Mode 1 (8-bit UART) Mode 3 (9-bit UART)	0	x	Controlled by timer 1 overflow: $(2^{\text{SMOD}} \times \text{Timer 1 overflow rate}) / 32$
	1	x	Controlled by baud rate generator $(2^{\text{SMOD}} \times \text{Timer 2}^1 \text{ overflow rate}) / 32$
Mode 2 (9-bit UART)	–	0	$f_{\text{SYS}} / 64$
		1	$f_{\text{SYS}} / 32$

¹⁾ Timer 2 functioning as baudrate generator

Capture/Compare Unit (CCU6)

The CCU6 provides two independent timers (T12, T13), which can be used for PWM generation, especially for AC-motor control. Additionally, special control modes for block commutation and multi-phase machines are supported.

Timer 12 Features

- Three capture/compare channels, each channel can be used either as capture or as compare channel.
- Generation of a three-phase PWM supported (six outputs, individual signals for highside and lowside switches)
- 16 bit resolution, maximum count frequency = system clock
- Dead-time control for each channel to avoid short-circuits in the power stage
- Concurrent update of the required T12/13 registers
- Center-aligned and edge-aligned PWM can be generated
- Single-shot mode supported
- Many interrupt request sources
- Hysteresis-like control mode

Timer 13 Features

- One independent compare channel with one output
- 16 bit resolution, maximum count frequency = system clock
- Can be synchronized to T12
- Interrupt generation at period-match and compare-match
- Single-shot mode supported

Additional Features

- Block commutation for Brushless DC-drives implemented
- Position detection via Hall-sensor pattern
- Automatic rotational speed measurement for block commutation
- Integrated error handling
- Fast emergency stop without CPU load via external signal ($\overline{\text{CTRAP}}$)
- Control modes for multi-channel AC-drives
- Output levels can be selected and adapted to the power stage
- Capture/compare unit can be powerdown in normal, idle and slow-down modes

The timer T12 can work in capture and/or compare mode for its three channels. The modes can also be combined. The timer T13 can work in compare mode only. The multi-channel control unit generates output patterns which can be modulated by T12 and/or T13. The modulation sources can be selected and combined for the signal modulation.

A/D Converter

The C868 includes a high performance / high speed 8-bit A/D-Converter (ADC) with 5 analog input channels. It operates with a successive approximation technique and uses self calibration mechanisms for reduction and compensation of offset and linearity errors. The A/D converter provides the following features:

- 5 multiplexed input channels, which can also be used as digital inputs
- 8-bit resolution with TUE of +/- 2 LSB8.
- Single or continuous conversion mode
- Interrupt request generation after each conversion
- Using successive approximation conversion technique via a capacitor array
- Built-in calibration of offset and linearity errors
- Powerdown in normal, idle and slow-down modes

The ADC supports two conversion modes - single and continuous conversions. For each mode, there are two ways in which conversion can be started - by software.

Writing a '1' to bit field ADST starts conversion on the channel that is specified by ADCH. In single conversion mode, bit field ADM is cleared to '0'. This is the default mode selected after hardware reset. When a conversion is started, the channel specified is sampled. The busy flag ADBSY is set and ADST is cleared. When the conversion is completed, an interrupt request signal is asserted and the 8-bit result is transferred to the result register ADDATH.

In continuous conversion mode, bit field ADM is set to '1'. In this mode, the ADC repeatedly converts the channel specified by ADCH. Bit ADST is cleared at the beginning of the first conversion. The busy flag ADBSY is asserted until the last conversion is completed. At the end of each conversion, the interrupt request signal will be asserted. To stop conversion, ADM has to be reset by software. If the channel number ADCH is changed while continuous conversion is in progress, the new channel specified will be sampled in the conversions that follow.

A new request to start conversion will be allowed only after the completion of any conversion that is in progress.

Conversion and sample time control

The conversion and sample times are programmed via the bit fields ADCTC and ADSTC respectively of the register ADCON1. Bit field ADCTC (conversion time control) selects the internal ADC clock - `adc_clk`. Bit field ADSTC (sample time control) selects the sample time.

Please note that the clock divider must be selected such that `adc_clk` does not exceed 2MHz.

The total A/D conversion time is given by:

$$t_{ADCC} = 4/f_{SYS} + t_S + 8.5/adc_clk \quad [5]$$

The sample time t_S is configured in periods of the selected internal ADC clock. The table below lists the possible combinations.

ADCTC	Clock Divider (TVC)	ADC Basic Clock <code>adc_clk</code>	ADSTC	Sample Time t_S (Periods of <code>adc_clk</code> , STC)
00 (default)	32	$f_{SYS} / 32$	00 (default)	2
01	20	$f_{SYS} / 20$	01	4
10	16	$f_{SYS} / 16$	10	8
11	12	$f_{SYS} / 12$	11	16

Interrupt System

The C868 provides 13 interrupt vectors with four priority levels. Nine interrupt requests are generated by the on-chip peripherals (timer 0, timer 1, timer 2, serial channel, A/D converter, and the capture/compare unit with 4 interrupts) and four interrupts may be triggered externally.

The wake-up from power-down mode interrupt has a special functionality which allows the software power-down mode to be terminated by a short negative pulse at pins CCPOS0/T2/INT0/AN0 or P1.4/RxD.

The 13 interrupt sources are divided into six groups. Each group can be programmed to one of the two interrupt priority levels. Additionally, 4 of these interrupt sources are channeled from 7 Capture/Compare (CCU6) interrupt sources.

Figure 15 to **Figure 20** give a general overview of the interrupt sources and illustrate the request and control flags.

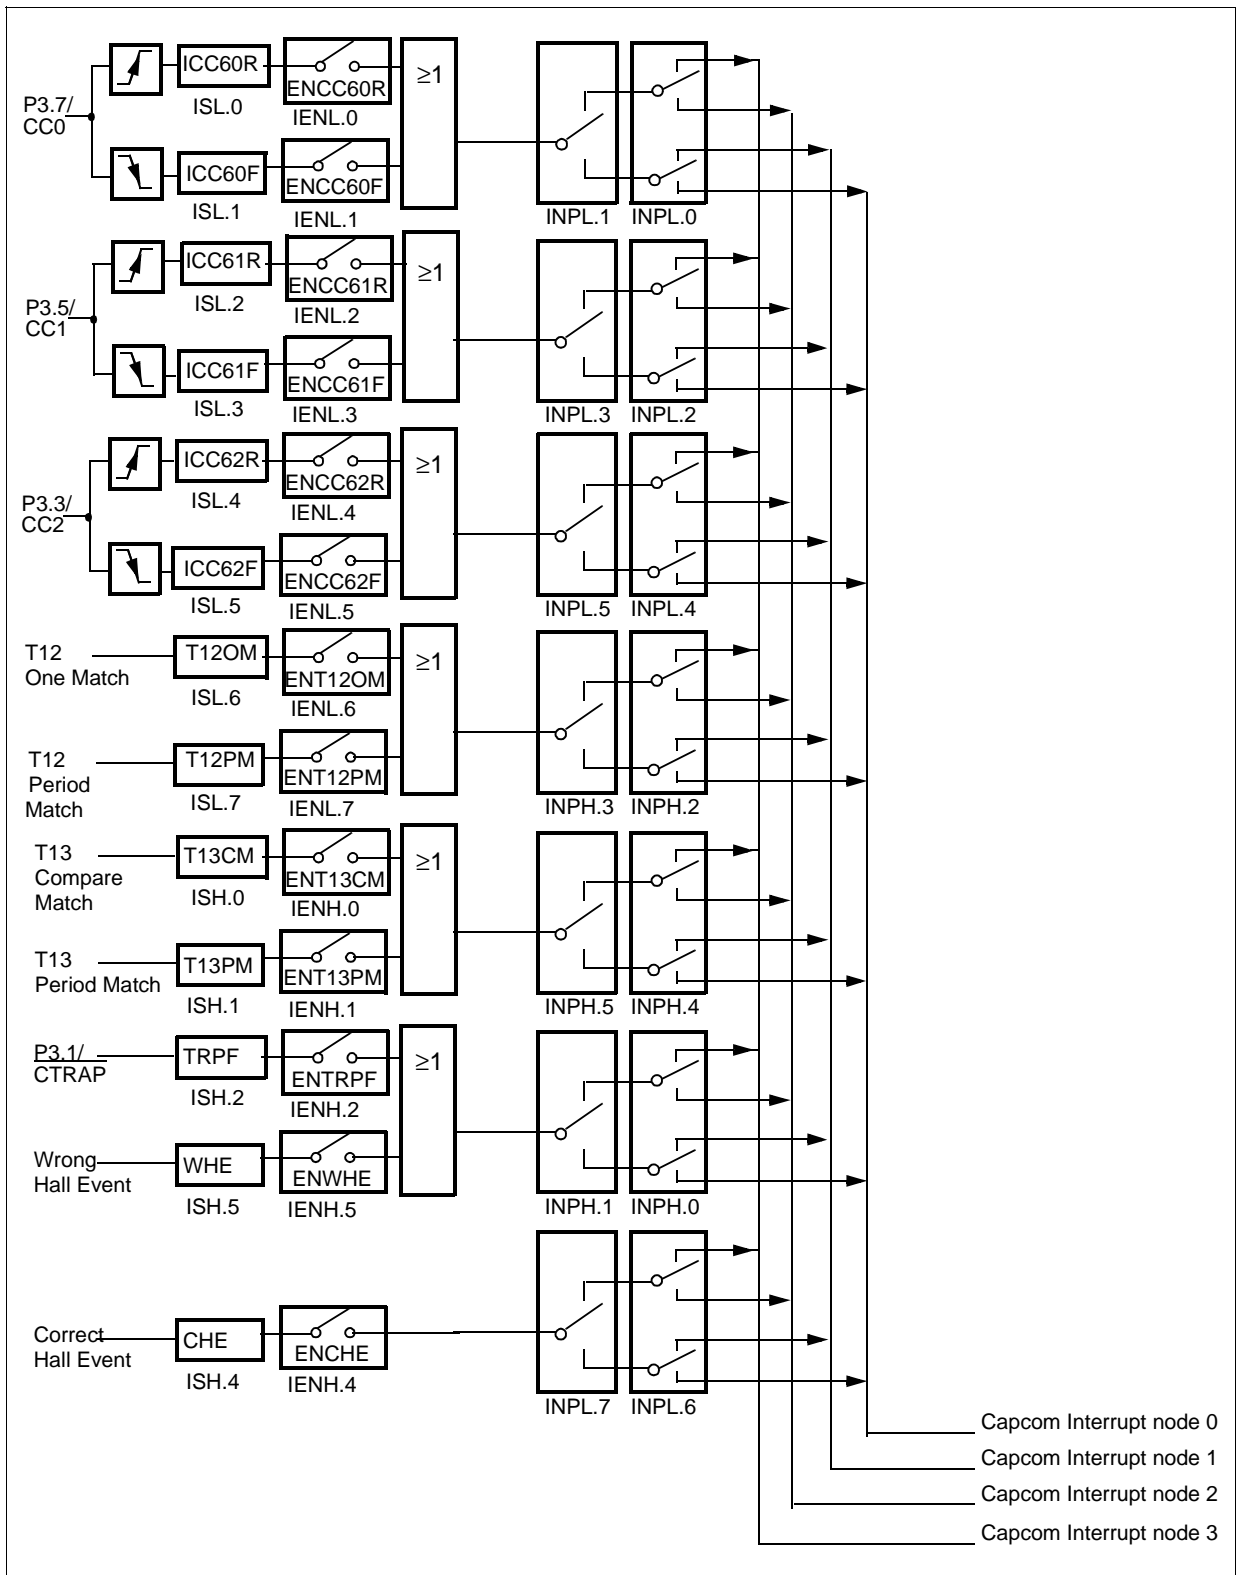

Figure 15 Capture/Compare module interrupt structure

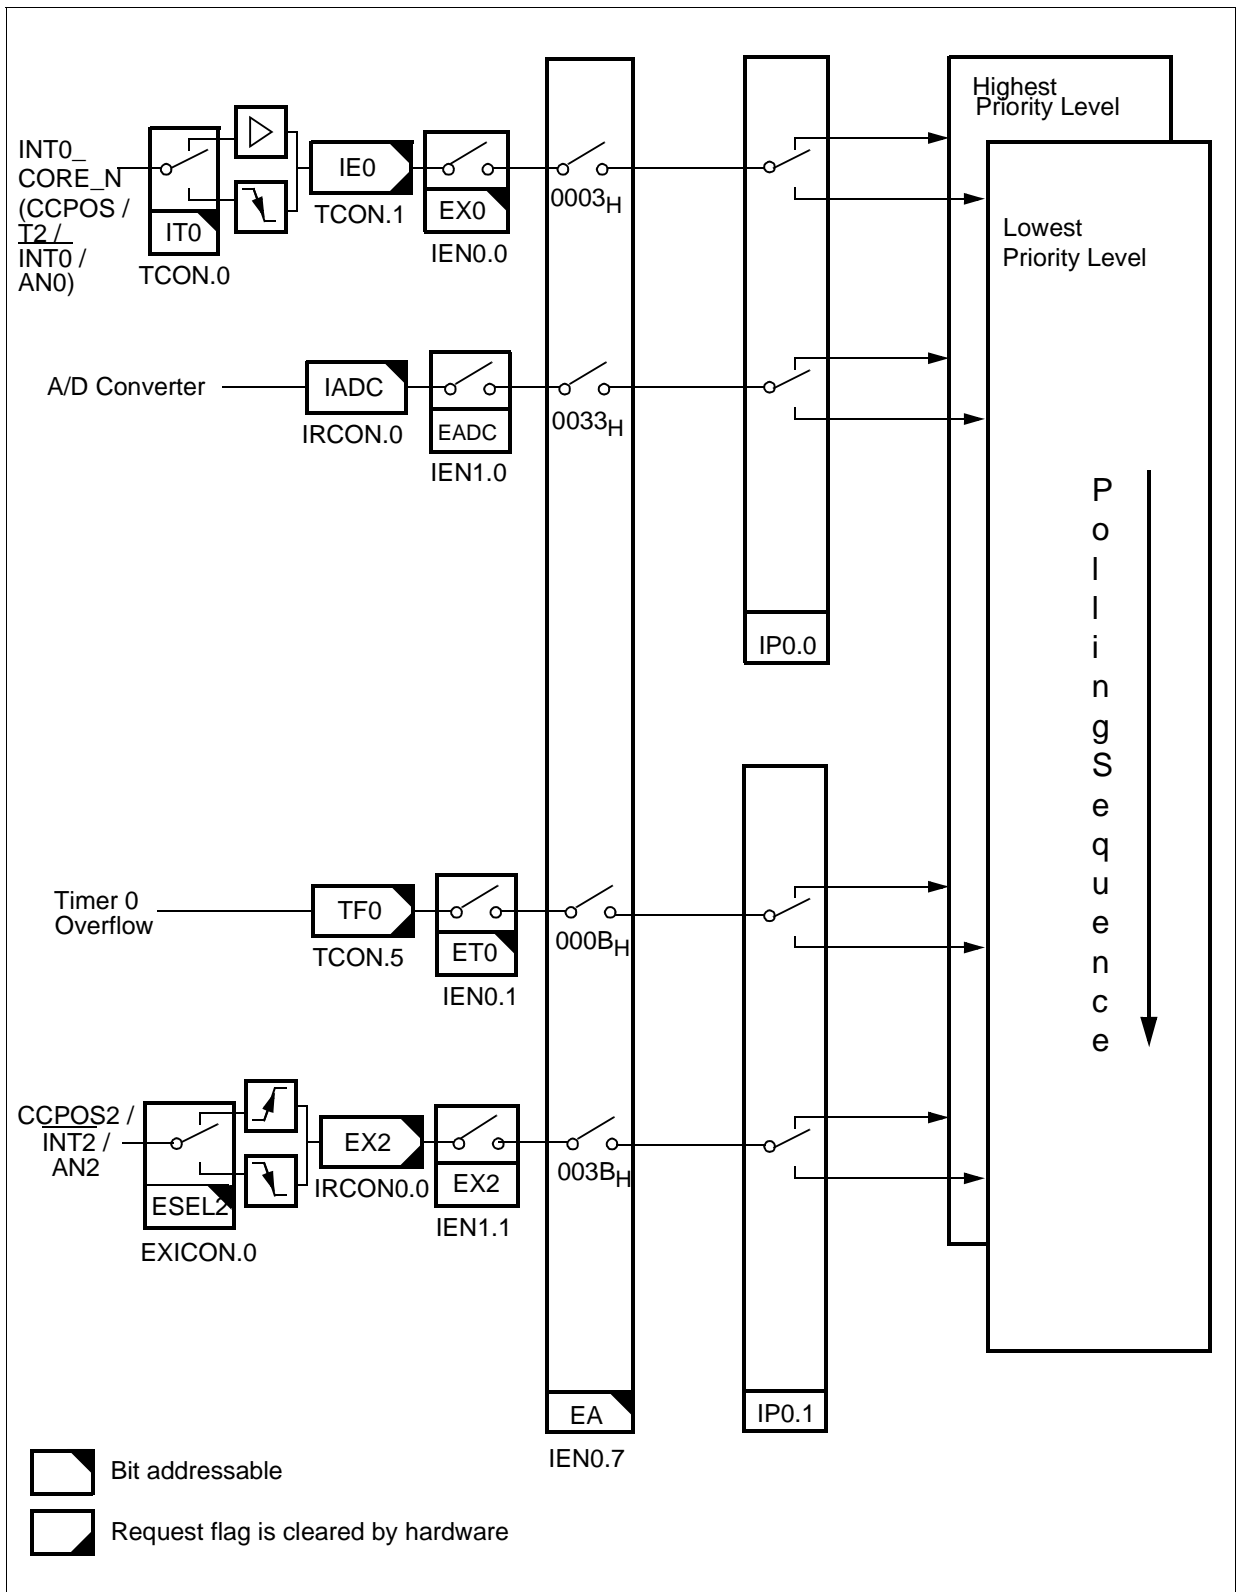

Figure 16 Interrupt Structure, Overview Part 1

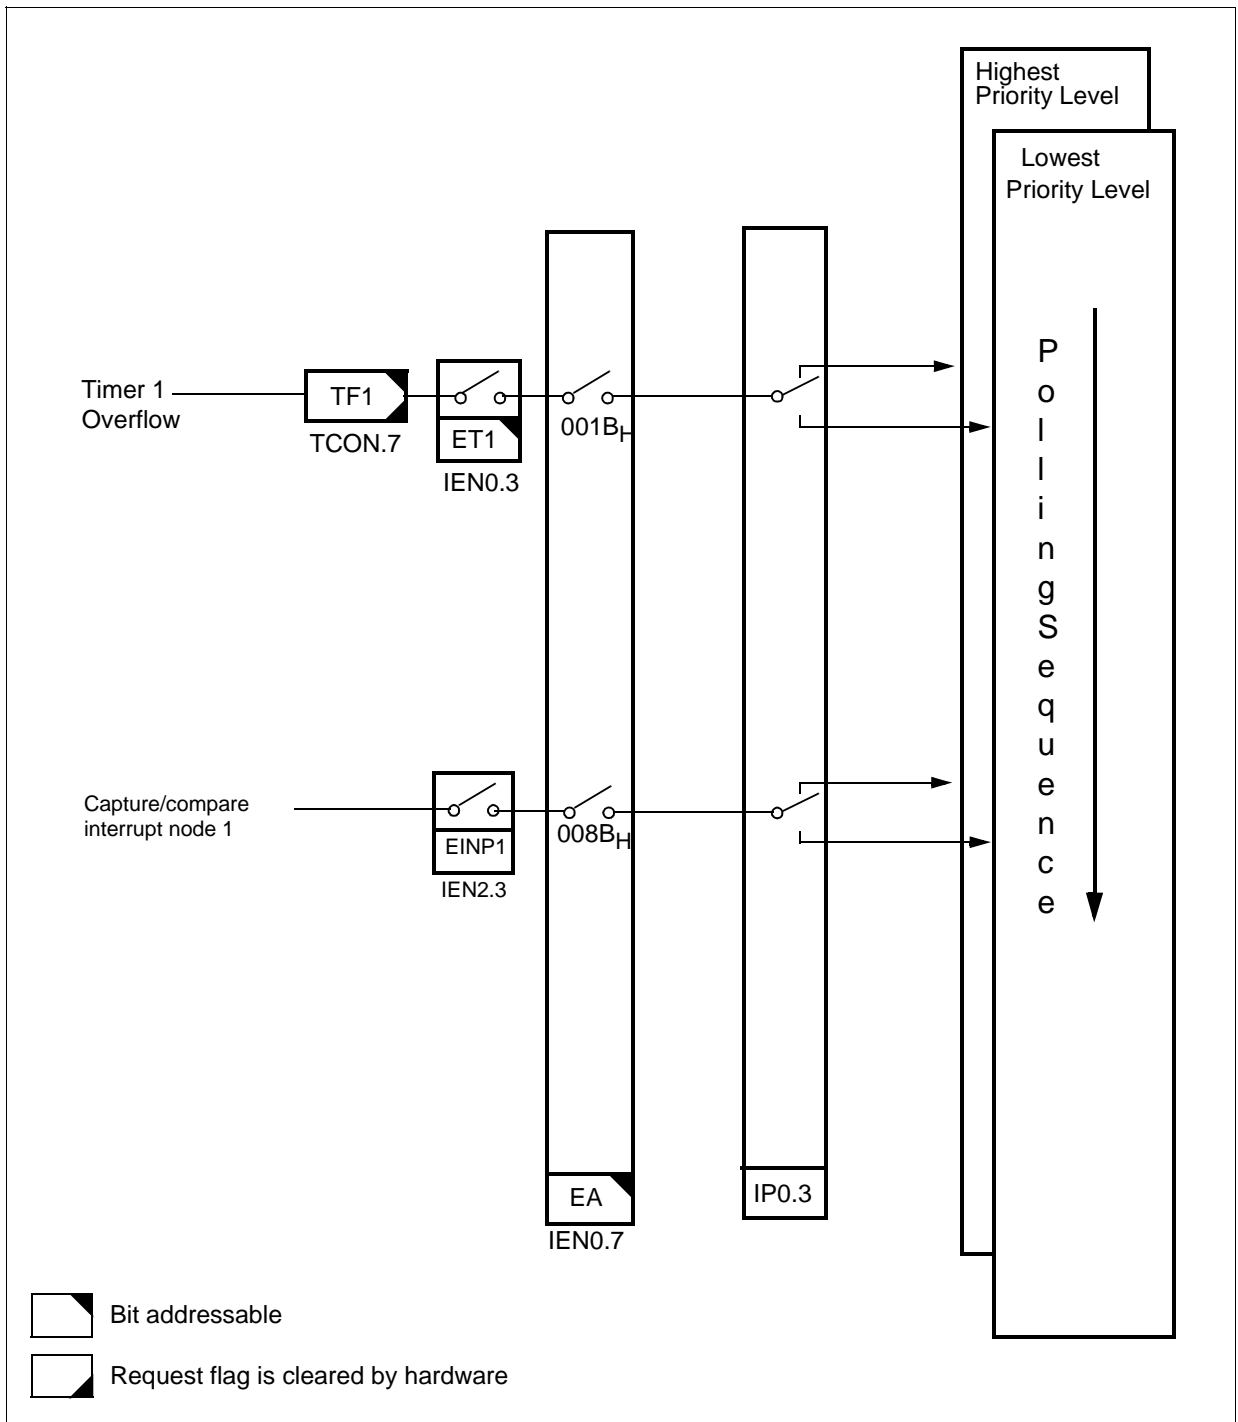

Figure 18 Interrupt Structure, Overview Part 3

Figure 19 Interrupt Structure, Overview Part 4

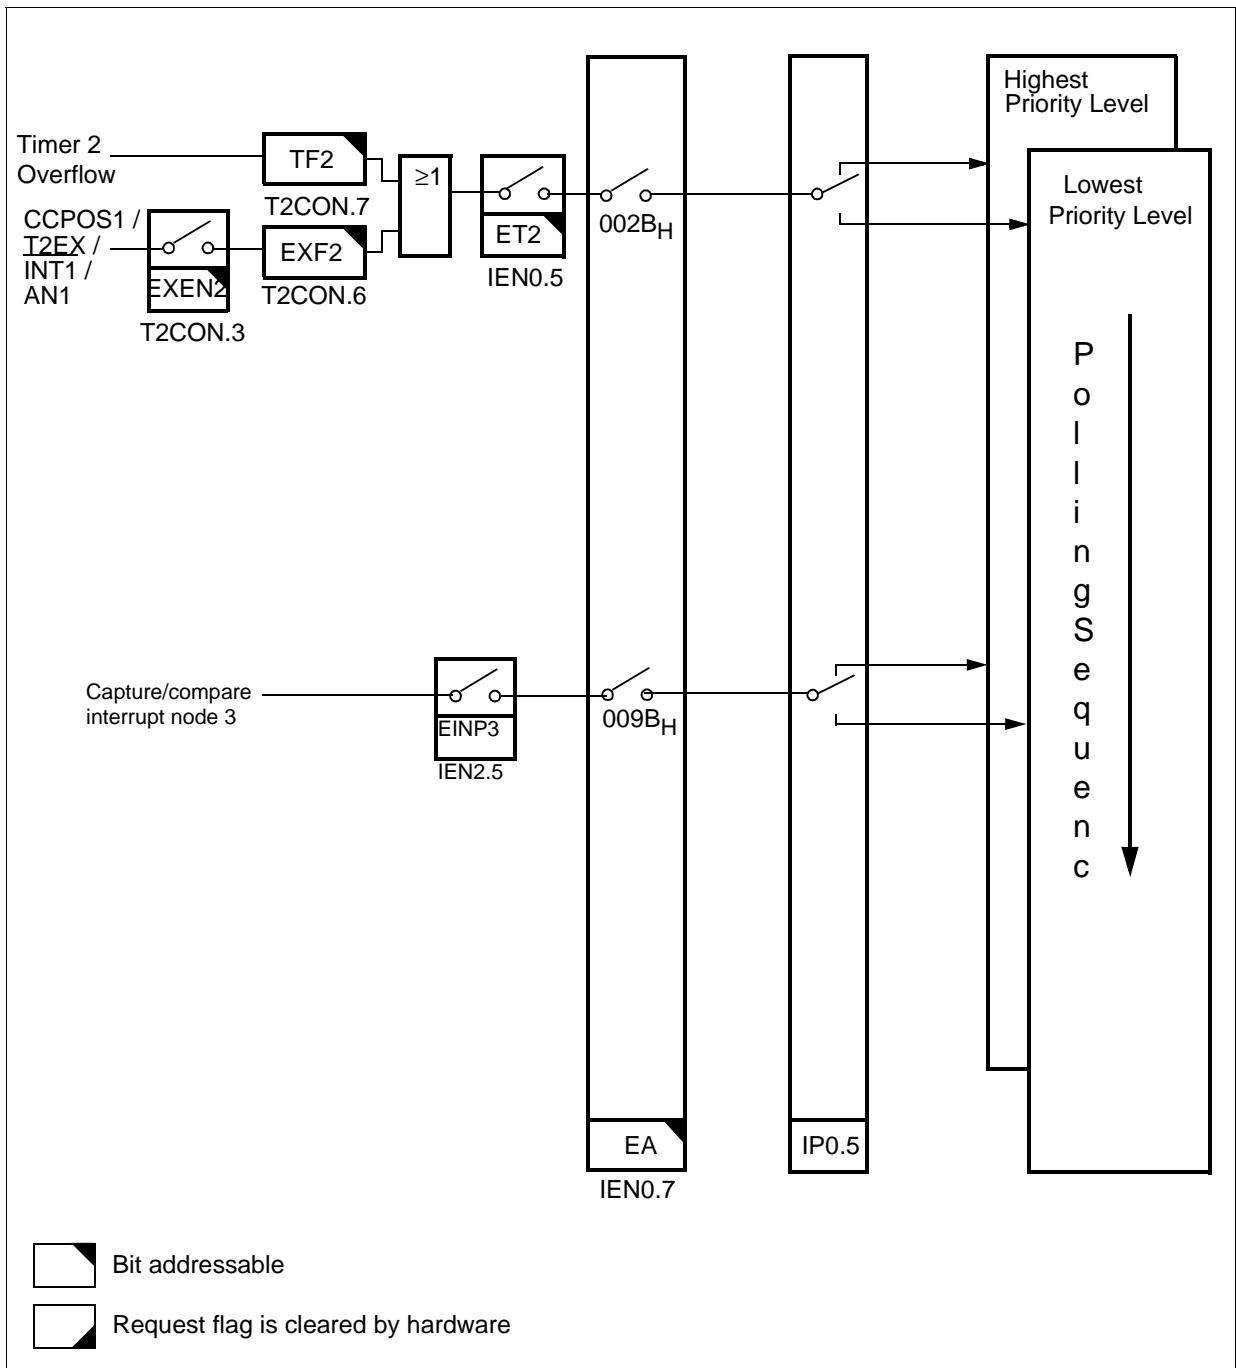

Figure 20 Interrupt Structure, Overview Part 5

Table 12 Interrupt Source and Vectors

Interrupt Source	Interrupt Vector Address(core connections)	Interrupt Request Flags
External Interrupt 0	0003 _H (EX0)	IE0
Timer 0 Overflow	000B _H (ET0)	TF0
External Interrupt 1	0013 _H (EX1)	IE1
Timer 1 Overflow	001B _H (ET1)	TF1
Serial Channel	0023 _H (ES)	RI / TI
Timer 2 Overflow	002B _H (EX5)	TF2
A/D Converter	0033 _H (EX6)	IADC
External Interrupt 2	003B _H (EX7)	IEX2
External Interrupt 3	0043 _H (EX8)	IEX3
	004B _H (EX9)	
	0053 _H (EX10)	
	005B _H (EX11)	
	0063 _H (EX12)	
	006B _H (EX13)	
CAPCOM interrupt node 0	0083 _H (EX14)	INP0 ¹⁾
CAPCOM interrupt node 1	008B _H (EX15)	INP1 ¹⁾
CAPCOM interrupt node 2	0093 _H (EX16)	INP2 ¹⁾
CAPCOM interrupt node3	009B _H (EX17)	INP3 ¹⁾
	00A3 _H (EX18)	
	00AB _H (EX19)	
	00D3 _H (EX20)	
	00DB _H (EX21)	
	00E3 _H (EX22)	
Wake-up from power-down mode	007B _H	–

¹⁾ Capture/compare has 10 interrupt sources channeled to the 4 interrupt nodes INP0..3. The 3 capture/compare ports has 3 pairs of interrupt request flags, ICC60R, ICC60F, ICC61R, ICC61F, ICC62R, ICC62F. The other flags are T12OM, T12PM, T13CM, T13PM, TRPF, WHE, CHE.

If two or more requests of different priority levels are received simultaneously, the request of the highest priority is serviced first. If requests of the same priority level are received simultaneously, an internal polling sequence determines which request is to be serviced first. Thus, within each priority level there is a second priority structure determined by the polling sequence. This is illustrated in [Table 13](#)

Table 13 Interrupt Source Structure

Interrupt Group	Priority Bits of Interrupt Group	Interrupt Source Priority				Priority
		High Priority	→		Low	
0	IP0.0	EXINT0	IADC			High ↓ Low
1	IP0.1	TF0	EXINT2			
2	IP0.2	EXINT1	EXINT3	INP0 ¹⁾		
3	IP0.3	TF1	INP1 ¹⁾			
4	IP0.4	RI + TI	INP2 ¹⁾			
5	IP0.5	TF2	INP3 ¹⁾			

¹⁾ Capture/compare has 10 interrupt sources channeled to the 4 interrupt nodes INP0..3. The 3 capture/compare ports has 3 pairs of interrupt request flags, ICC60R, ICC60F, ICC61R, ICC61F, ICC62R, ICC62F. The other flags are T12OM, T12PM, T13CM, T13PM, TRPF, WHE, CHE.

Within a column, the topmost interrupt is serviced first, then the second and the third, when available. The interrupt groups are serviced from left to right of the table. A low-priority interrupt can itself be interrupted by a higher-priority interrupt, but not by another interrupt of the same or a lower priority. An interrupt of the highest priority level cannot be interrupted by another interrupt source.

Fail Save Mechanisms

The C868 offers enhanced fail save mechanisms, which allow an automatic recovery from software upset or hardware failure :

a programmable watchdog timer (WDT), with variable time-out period from 12.8 μ s to 819.2 μ s at $f_{SYS} = 40$ MHz.

Programmable Watchdog Timer

To protect the system against software failure, the user’s program has to clear this watchdog within a previously programmed time period. If the software fails to do this periodical refresh of the watchdog timer, an internal reset will be initiated. The software can be designed so that the watchdog times out if the program does not work properly. It also times out if a software error is based on hardware-related problems.

The watchdog timer in the C868 is a 16-bit timer, which is incremented by a count rate of $f_{SYS}/2$ upto $f_{SYS}/128$. The machine clock of the C868 is divided by a prescaler, a divide-by-two or a divide-by-128 prescaler. The upper 8 bits of the Watchdog Timer can be preset to a user-programmable value via a watchdog service access in order to vary the watchdog expire time. The lower 8 bits are reset on each service access. **Figure 21** shows the block diagram of the watchdog timer unit.

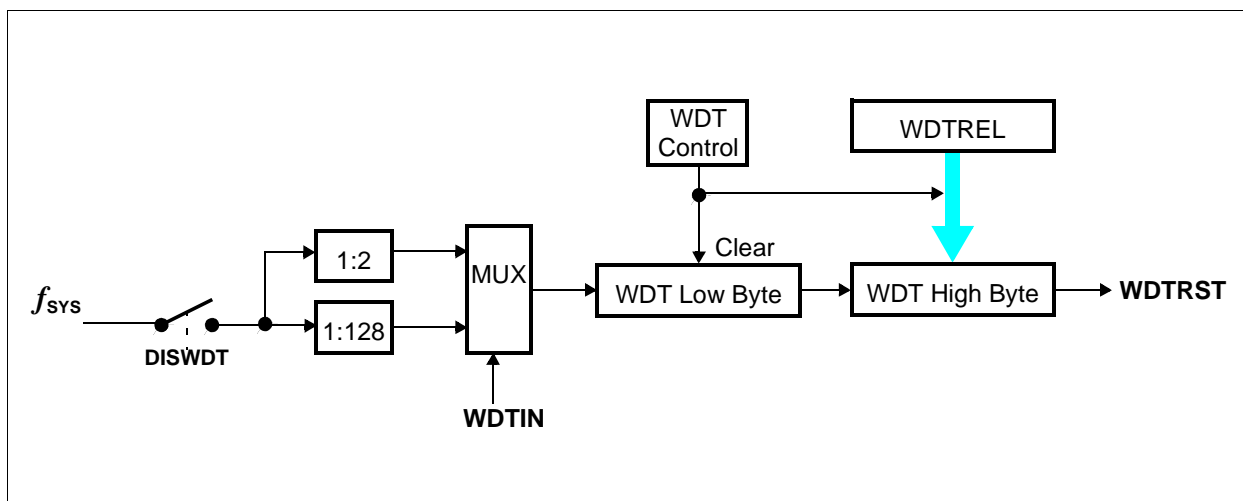

Figure 21 Block Diagram of the Programmable Watchdog Timer

After a reset, the Watchdog Timer is automatically enabled. If it is disabled, it cannot be enabled again during active mode of the device. If the software fails to clear the watchdog timer an internal reset will be initiated. The reset cause (external reset or reset caused by the watchdog) can be examined by software (status flag $WDTR$ in $SCUWDT$ is set). A refresh of the watchdog timer is done by setting bits $WDTRE$ and $WDTRS$ (in

SFR SCUWDT) consecutively. This double instruction sequence has been implemented to increase system security.

It must be noted, however, that the watchdog timer is halted during the idle mode and power-down mode of the processor (see section "Power Saving Modes"). It is not possible to use the idle mode in combination with the watchdog timer function. Therefore, even the watchdog timer cannot reset the device when one of the power saving modes has been entered accidentally.

The time period for an overflow of the Watchdog Timer is programmable in two ways :

- **the input frequency** to the Watchdog Timer can be selected via bit WDTIN in register WDTCON to be either $f_{SYS}/2$ or $f_{SYS}/128$.
- **the reload value** WDTREL for the high byte of WDT can be programmed in register WDTCON.

The period P_{WDT} between servicing the Watchdog Timer and the next overflow can therefore be determined by the following formula:

[0.1]

$$P_{WDT} = \frac{2^{(1+WDTIN*6)} * (2^{16} - WDTREL * 2^8)}{f_{SYS}}$$

Table 14 lists the possible ranges for the watchdog time which can be achieved using a certain module clock. Some numbers are rounded to 3 significant digits.

Table 14 Watchdog Time Ranges

Reload value in WDTREL	Prescaler for f_{SYS}					
	2 (WDTIN = '0')			128 (WDTIN = '1')		
	40 MHz	20 MHz	16 MHz	40 MHz	20 MHz	16 MHz
FF _H	12.8 μs	25.6 μs	32.0 μs	819.2 μs	1.64 ms	2.05 ms
7F _H	1.65 ms	3.3 ms	4.13 ms	105.7 ms	211.3 ms	264 ms
00 _H	3.28 ms	6.55 ms	8.19 ms	209.7 ms	419.4 ms	524 ms

For safety reasons, the user is advised to rewrite WDTCON each time before the Watchdog Timer is serviced.

Power Saving Modes

The C868 provides two basic power saving modes, the idle mode and the power down mode. Additionally, a slow down mode is available. This power saving mode reduces the internal clock rate in normal operating mode and it can also be used for further power reduction in idle mode.

- **Idle Mode**

In the idle mode, the oscillator of the C868 continues to run, but the CPU is gated off from the clock signal. However, the interrupt system, the serial port, the A/D converter, the capture/compare unit, and all timers are further provided with the clock. The CPU status is preserved in its entirety: the stack pointer, program counter, program status word, accumulator, and all other registers maintain their data during idle mode.

- **Slow Down Mode**

In some applications, where power consumption and dissipation are critical, the controller might run for a certain time at reduced speed (for example, if the controller is waiting for an input signal). Since in CMOS devices, there is an almost linear dependence of the operating frequency and the power supply current, so, a reduction of the operating frequency results in reduced power consumption.

- **Software Power Down Mode**

In the software power down mode, the on-chip oscillator which operates with the XTAL pins and the PLL are all stopped. Therefore, all functions of the microcontroller are stopped and only the contents of the on-chip RAM, XRAM and the SFR's are maintained. The port pins, which are controlled by their port latches, output the values that are held by their SFR's. The port pins which serve the alternate output functions show the values they had at the end of the last cycle of the instruction which initiated the power down mode. ALE is held at logic low level or high impedance if disabled. In the power down mode of operation, V_{DDC} and V_{DDP} can be reduced to minimize power consumption. It must be ensured, however, that V_{DDC} and V_{DDP} is not reduced before the power down mode is invoked, and that V_{DDC} and V_{DDP} is restored to its normal operating level before the power down mode is terminated. However, V_{DDC} cannot be lower than V_{DDP} by more than 1(tbd) volt.

Table 15 Power Saving Modes Overview

Mode	Entering	Leaving by	Remarks
Idle Mode	ORL PCON,#01 _H	Occurance of any enabled interrupt	CPU clock is stopped; CPU maintains its data; peripheral units are active (if enabled) and provided with clock
		Hardware Reset	
Slow Down Mode	In normal mode: ORL PCON,#10 _H	ANL PCON,#0EF _H or Hardware Reset	Internal clock rate is reduced to a configurable factor of 1/2 to 1/32 of the system clock rate
	With idle mode: ORL PCON,#11 _H	Occurance of any enabled interrupt to exit idle mode and the instruction ANL PCON,#0EF _H to terminate slow down mode Hardware Reset	CPU clock is stopped; CPU maintains all its data; Peripheral units are active (if enabled) and provided with a configurable factor of 1/2 to 1/32 of the system clock rate
Software Power Down mode	With external wake-up capability from power down enabled ORL PMCON0,#01 _H ____ (to wake-up via pin INT0) or ORL PMCON0,#03 _H (to wake-up via pin RxD) ORL PCON,#02 _H	Hardware Reset When $\overline{\text{INT0}}$ or RxD goes low for at least 10 μs (latch phase). But it is desired that the corresponding pin must be held at high level during the power down mode entry and up to the wake-up.	Oscillator is stopped; Contents of on-chip RAM and SFR's are maintained
	With external wake-up capability from power down disabled ORL PCON,#02 _H	Hardware Reset	

Device Specifications

Absolute Maximum Ratings

Absolute Maximum Rating Parameters

Parameter	Symbol	Limit Values		Unit	Notes
		min.	max.		
Ambient temperature under bias	T_A	-40	110	°C	-
Storage temperature	T_{STG}	-65	150	°C	-
Voltage on V_{DDP} pins with respect to ground (V_{SSP})	V_{DDP}	-0.3	4.0	V	-
Voltage on V_{DDC} pins with respect to ground (V_{SSC})	V_{DDC}	-0.3	tbd	V	-
Voltage on V_{AREF} pins with respect to ground (V_{AGND})	V_{AREF}	-0.5	$V_{DDC}+tbd$	V	-
Voltage on any pin except int/analog and XTAL with respect to ground (V_{SSP})	V_{IN}	-0.5	$V_{DDP}+0.5$	V	-
Voltage on any int/analog pin with respect to ground (V_{SSP})	V_{IN1}	-0.5	$V_{DDC}+tbd$	V	-
Voltage on XTAL pins with respect to ground (V_{SSC})	V_{IN2}	-0.5	$V_{DDC}+0.5$	V	-
Input current on any pin during overload condition	I_{IN}	-36.9	14.0	mA	-
Absolute sum of all input currents during overload condition	ΣI_{IN}	-	43	mA	-
Power dissipation	P_{DISS}	-	tbd	W	-

Note: Stresses above those listed under “Absolute Maximum Ratings” may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability. During absolute maximum rating overload conditions ($V_{IN}>V_{DDP}$ or $V_{IN}<V_{SSP}$, $V_{IN2}>V_{DDC}$ or $V_{IN2}<V_{SSC}$) the voltage on V_{DDP} and V_{DDC} pins with respect to ground (V_{SSP} , V_{SSC}) must not exceed the values defined by the absolute maximum ratings.

Operating Conditions

The following operating conditions must not be exceeded in order to ensure correct operation of the C868. All parameters specified in the following sections refer to these operating conditions, unless otherwise noticed.

Operating Condition Parameters

Parameter	Symbol	Limit Values		Unit	Notes
		min.	max.		
Digital supply voltage	V_{DDP}	3.0	3.6	V	Active mode, $f_{SYSmax} = 40$ MHz
		tbd ¹⁾	$V_{DDC} + tbd^{2)}$	V	PowerDown mode
Digital supply voltage	V_{DDC}	2.125	2.75	V	Active mode, $f_{SYSmax} = 40$ MHz
		tbd ²⁾	2.75	V	PowerDown mode
Digital ground voltages	V_{SSC}, V_{SSP}	0		V	-
Overload current	I_{OV}	-	± 10	mA	Per pin ³⁾ ⁴⁾
Ambient temperature	T_A	0	70	°C	SAB-C868...
		-40	85	°C	SAF-C868...
Analog reference voltage	V_{AREF}	tbd	$V_{DDP} + 0.1$	V	-
Analog ground voltage	V_{AGND}	$V_{SSP} - 0.1$	$V_{SSP} + 0.1$	V	-
Analog input voltage	V_{AIN}	V_{AGND}	V_{AREF}	V	-
External Clock	f_{OSC}	6.67	10.67	MHz	-

Notes:

- 1) Oscillator or external clock disabled.
- 2) Output voltages and output currents will be reduced when V_{DDP} leaves the range defined for active mode.
- 3) Overload conditions occur if the standard operating conditions are exceeded, i.e. the voltage on any pin exceeds the specified range (i.e. $V_{OV} > V_{DDP} + 0.5V$ or $V_{OV} < V_{SSP} - 0.5V$). The absolute sum of input overload currents on all pins may not exceed **43 mA**. The supply voltage must remain within the specified limits.
Proper operation is not guaranteed if overload conditions occur on functional pins line XTAL1 etc.
- 4) Not 100% tested, guaranteed by design characterization.

DC Characteristics

(Operating Conditions apply)

Parameter	Symbol	Limit Values		Unit	Test Condition
		min.	max.		
Input low voltages all except XTAL2, int/analog int/analog XTAL2	V_{IL0} V_{IL1} V_{IL2}	-0.5 -0.5 -0.5	1.16 1.00 tbd	V V V	– ¹⁾
Input high voltages all except XTAL2, int/analog int/analog XTAL2	V_{IH0} V_{IH1} V_{IH2}	1.85 1.54 tbd	$V_{DDP}+0.5$ $V_{DDP}+0.5$ $V_{DDC}+0.5$	V V V	–
Output low voltage	V_{OL}	–	0.4	V	$I_{OL}=9.8\text{mA}$
Output high voltage	V_{OH}	2.4	–	V	$I_{OH}=18\text{mA}$
Input leakage current (all except int/analog)	I_{LI0}	tbd	tbd	uA	$0.4 < V_{IN} < V_{DDP}$
Input leakage current (int/analog)	I_{LI1}	tbd	tbd	uA	$0.4 < V_{IN} < V_{DDP}$ 2)
Input low current (XTAL2)	I_{LI2}	tbd	tbd	V	$V_{IN}=0.4$
Pin capacitance	C_{IO}	-	10	pF	$f_C = 1\text{MHz}$ $T_A = 25^\circ\text{C}$
Overload current	I_{OV}	-	± 5	mA	Per pin ³⁾ ⁴⁾

Note:

- 1) Interrupt/analog pins are input only and has CMOS characteristics whereas the other I/O pins have TTL characteristics.
- 2) The leakage current of interrupt/analog pins depends on the leakage current of the CMOS pad for the digital functions and the analog pad.
- 3) Overload conditions occur if the standard operations conditions are exceeded, i.e. the voltage on any pin exceeds the specified range (i.e. $V_{OV} > V_{DDP}+0.5\text{V}$ or $V_{OV} < V_{SSP}-0.5\text{V}$). The absolute sum of input overload currents on all pins may not exceed **43 mA**. The supply voltage must remain within the specified limits.
Proper operation is not guaranteed if overload conditions occur on functional pins line XTAL1 etc.
- 4) Not 100% tested, guaranteed by design characterization.

Power Supply Current

Parameter			Symbol	Limit Values		Unit	Test Condition
				typ. ¹⁾	max. ²⁾		
Active mode	C868-1S	40 MHz ³⁾	I_{DDC}	tbd	tbd	mA	4)

			I_{DDP}	tbd	tbd	mA	
	C868-1R	40 MHz ³⁾	I_{DDC}	tbd	tbd	mA	
			I_{DDP}	tbd	tbd	mA	
Idle mode with slow-down enabled	C868-1S	40 MHz ³⁾	I_{DDC}	tbd	tbd	mA	7)
			I_{DDP}	tbd	tbd	mA	
	C868-1R	40 MHz ³⁾	I_{DDC}	tbd	tbd	mA	
			I_{DDP}	tbd	tbd	mA	
Power-down mode	C868-1S		I_{PDC1}	tbd	tbd	uA	$V_{DDC}=tbd..2.75V^8)$ $V_{DDP}=tbd$
			I_{PDP1}	tbd	tbd	uA	
	C868-1R		I_{PDC2}	tbd	tbd	uA	$V_{DDC}=1.5V^8)$ $V_{DDP}=1.5V$
			I_{PDP2}	tbd	tbd	uA	

Note:

- 1) The typical I_{DDP} and I_{DDC} values are periodically measured at $T_A = + 25\text{ °C}$ but not 100% tested.
- 2) The maximum I_{DDP} and I_{DDC} values are measured under worst case conditions ($T_A = 0\text{ °C}$ or $- 40\text{ °C}$ and $V_{DDP} = 3.6\text{ V}$, $V_{DDC} = 2.75\text{ V}$).
- 3) System clock, set by using external clock of 10.67MHz and setting KDIV in CMCON to 010 (factor of 4)

- 4) I_{DDC} and I_{DDP} (active mode) is measured with:
 $\overline{XTAL2}$ driven with $t_R, t_F = 5 \text{ ns}$, $V_{IL1}, V_{IL2} = V_{SSP} + 0.5 \text{ V}$, $V_{IH1}, V_{IH2} = V_{DDP} - 0.5 \text{ V}$; $XTAL1 = \text{N.C.}$;
 $\overline{RESET} = V_{DDP}$; all other pins are disconnected. I_{DDC} would be slightly higher if the crystal oscillator is used (approx. 1 mA).
- 5) I_{DDC} and I_{DDP} (idle mode) is measured with all output pins disconnected and with all peripheral disabled:
 $\overline{XTAL2}$ driven with $t_R, t_F = 5 \text{ ns}$, $V_{IL1}, V_{IL2} = V_{SSP} + 0.5 \text{ V}$, $V_{IH1}, V_{IH2} = V_{DDP} - 0.5 \text{ V}$; $XTAL1 = \text{N.C.}$;
 $\overline{RESET} = V_{DDP}$; all other pins are disconnected.
- 6) I_{DDC} and I_{DDP} (active mode with slow down mode) is measured with all output pins disconnected:
 $\overline{XTAL2}$ driven with $t_R, t_F = 5 \text{ ns}$, $V_{IL1}, V_{IL2} = V_{SSP} + 0.5 \text{ V}$, $V_{IH1}, V_{IH2} = V_{DDP} - 0.5 \text{ V}$; $XTAL1 = \text{N.C.}$;
 $\overline{RESET} = V_{DDP}$; all other pins are disconnected; the microcontroller is put into slow-down mode by software with the slow-down clock set to 1/32 of system clock.
- 7) I_{PDC1} and I_{PDP1} (idle mode with slow down mode) is measured with all output pins disconnected and with all peripheral disabled:
 $\overline{XTAL2}$ driven with $t_R, t_F = 5 \text{ ns}$, $V_{IL1}, V_{IL2} = V_{SSP} + 0.5 \text{ V}$, $V_{IH1}, V_{IH2} = V_{DDP} - 0.5 \text{ V}$; $XTAL1 = \text{N.C.}$;
 $\overline{RESET} = V_{DDP}$; all other pins are disconnected; the microcontroller is put into slow-down mode by software with the slow-down clock set to 1/32 of system clock.
- 8) I_{PDC2} and I_{PDP2} (power-down mode) is measured under the following conditions:
 $\overline{RESET} = V_{DDP}$; $XTAL2 = V_{SSC}$; $XTAL1 = \text{N.C.}$; $V_{AGND} = V_{SSP}$; $V_{AREF} = V_{DDP}$; all other pins are disconnected; ALE output disabled.

Power Supply Current Calculation Formulae

Parameter		Symbol	Formula
Active mode	C868-1S	$I_{DDC_{typ}}$	tbd
		$I_{DDC_{max}}$	tbd
	C868-1R	$I_{DDC_{typ}}$	tbd
		$I_{DDC_{max}}$	tbd
Idle mode	C868-1S	$I_{DDC_{typ}}$	tbd
		$I_{DDC_{max}}$	tbd
	C868-1R	$I_{DDC_{typ}}$	tbd
		$I_{DDC_{max}}$	tbd
Active mode with slow-down enabled	C868-1S	$I_{DDC_{typ}}$	tbd
		$I_{DDC_{max}}$	tbd
	C868-1R	$I_{DDC_{typ}}$	tbd
		$I_{DDC_{max}}$	tbd
Idle mode with slow-down enabled	C868-1S	$I_{DDC_{typ}}$	tbd
		$I_{DDC_{max}}$	tbd
	C868-1R	$I_{DDC_{typ}}$	tbd
		$I_{DDC_{max}}$	tbd

A/D Converter Characteristics (Operating Condition Parameters)

Parameter	Symbol	Limits		Unit	Test Condition
		min	max		
Analog input voltage	V_{AIN}	V_{AGND}	V_{AREF}	V	1)
Sample time	t_S	64* t_{SYS} 40* t_{SYS} 32* t_{SYS} 24* t_{SYS}	512* t_{SYS} 320* t_{SYS} 256* t_{SYS} 192* t_{SYS}	ns	Prescaler/32 Prescaler/20 Prescaler/16 Prescaler/12
Conversion cycle time	t_{ADCC}	340* t_{SYS} 214* t_{SYS} 172* t_{SYS} 130* t_{SYS}	788* t_{SYS} 494* t_{SYS} 396* t_{SYS} 298* t_{SYS}	ns	Prescaler/32 Prescaler/20 Prescaler/16 Prescaler/12
Total unadjusted error	T_{UE}	–	±2	LSB	$V_{AGND} \leq V_{AIN} \leq V_{AREF}$ 2)
Internal resistance of reference voltage source	R_{AREF}	–	–	kΩ	3)5)
Internal resistance of analog source	R_{ASRC}	–	–	kΩ	4)5)
ADC input capacitance	C_{AIN}	–	50	pF	5)

Note:

- 1) V_{AIN} may exceed V_{AGND} or V_{AREF} up to the maximum ratings. However, the conversion result in these cases will be 00_H or FF_H, respectively.
- 2) T_{UE} (max.) is tested at $-40 \leq T_A \leq 85$ °C; $V_{DD} \leq 3.6$ V; $V_{AREF} \leq V_{DDP} + 0.1$ V and $V_{SSP} \leq V_{AGND}$. It is guaranteed by design characterization for all other voltages within the defined voltage range.
- 3) During the conversion the ADC's capacitance must be repeatedly charged or discharged. The internal resistance of the reference source must allow the capacitance to reach their final voltage level within the indicated time. The maximum internal resistance results from the programmed conversion timing.
- 4) During the sample time the input capacitance C_{AIN} must be charged/discharged by the external source. The internal resistance of the analog source must allow the capacitance to reach their final voltage level within t_S . After the end of the sample time t_S , changes of the analog input voltage have no effect on the conversion result.
- 5) Not 100% tested, but guaranteed by design characterization.

Clock calculation table for ADC

TVC	32				20				
STC	2	4	8	16	2	4	8	16	t_{ADC}
t_{ADCC}	340	404	532	788	214	254	334	494	t_{SYS}
t_S	64	128	256	512	40	80	160	320	t_{SYS}

TVC	16				12				
STC	2	4	8	16	2	4	8	16	t_{ADC}
t_{ADCC}	172	204	268	396	130	154	202	298	t_{SYS}
t_S	32	64	128	256	24	48	96	192	t_{SYS}

TVC is the clock divider specified by bit fields ADCTC. STC is the sample time control specified by bit fields ADSTC. t_{ADC} is $t_{SYS} * TVC$. $t_{ADC\ min} = 500\text{ns}$.

AC Characteristics
(Operating Condition Apply)
External Clock Drive Characteristics

Parameter	Symbol	Limit Values		Unit
		Variable Ext Clock 6.67 to 10.67 MHz		
		min	max	
Oscillating period	t_{OSC}	93.75	150	ns
High time	t_1	46.875	75	ns
Low time	t_2	46.875	75	ns
Rise time	t_R	-	10	ns
Fall time	t_F	-	10	ns

ALE Characteristics

Parameter	Symbol	Limit Values		Unit
		System freq = 6.25MHz to 40MHz Duty Cycle 0.5		
		min	max	
ALE pulse width	t_{AWD}	50	320	ns
ALE period	t_{ACY}	150	960	ns

Plastic Package, P-DSO-28-1 for SAB-C868-1SR, SAB-C868-1RR, SAF-C868-1SR and SAF-C868-1RR

- 1) Does not include plastic or metal protrusion of 0.15 max. per side
- 2) Does not include dambar protrusion of 0.08 max. per side
- 3) Does not include plastic or metal protrusion of 0.25 max. per side

Infineon goes for Business Excellence

“Business excellence means intelligent approaches and clearly defined processes, which are both constantly under review and ultimately lead to good operating results.

Better operating results and business excellence mean less idleness and wastefulness for all of us, more professional success, more accurate information, a better overview and, thereby, less frustration and more satisfaction.”

Dr. Ulrich Schumacher
