High−Performance Silicon−Gate CMOS

The 74HC125 is identical in pinout to the LS125. The device inputs are compatible with standard CMOS outputs; with pullup resistors, they are compatible with LSTTL outputs.

The 74HC125 noninverting buffer is designed to be used with 3−state memory address drivers, clock drivers, and other bus−oriented systems. The device has four separate output enables that are active−low.

Note:Absolute Maximum Ratings indicate limits beyond which damage to the device may occur. Operating Ratings indicate conditions for which the device is intended to be functional, but specific performance is not ensured.

This device contains protectioncircuitry to guard against damagedue to high static voltages or electricfields. However, precautions mustbe taken to avoid applications of anyvoltage higher than maximum ratedvoltages to this high−impedance cir-cuit. For proper operation, V_{in} andV_{out} should be constrained to therange GND ≤ (V_{in} or V_{out}) ≤ VCC. Unused inputs must always be tied to an appropriate logic voltagelevel (e.g., either GND or V_{CC}).

Unused outputs must be left open.Stresses exceeding Maximum Ratinommended Operating Conditions may affect device reliability.†Derating − SOP Package: – 7 mW/°C from 65° to 125°C TSSOP Package: − 6.1 mW/°C fgs may damage the device. Maximum Ratings are stress ratings only. Functional operation above the Recommended Operating Conditions is not implied. Extended exposure to stresses above the Recrom 65° to 125°C
