Description

The Harris HA-2539 represents the ultimate in high slew rate, wideband, monolithic operational amplifiers. It has been designed and constructed with the Harris High Frequency Bipolar Dielectric Isolation process and features dynamic parameters never before available from a truly differential device.

With a 600V/ μ s slew rate and a 600MHz gain bandwidth product, the HA-2539 is ideally suited for use in video and RF amplifier designs, in closed loop gains of 10 or greater. Full $\pm 10\text{V}$ swing coupled with outstanding AC parameters and complemented by high open loop gain makes the devices useful in high speed data acquisition systems.

For further design assistance please refer to Application Note AN541 (Using the HA-2539 Very High Slew Rate Wideband Operational Amplifiers) and Application Note AN556 (Thermal Safe-Operating-Areas For High Current Operational Amplifiers).

For military grade product information, the HA-2539/883 data sheet is available upon request.

For a lower power version of this product, please see the HA-2839 and HA-2840 data sheets.

Operating Conditions

Temperature Range	
HA-2539-2	-55°C to 125°C
HA-2539/2539C-5	0°C to 75°C
HA-2539-9	-40°C to 85°C

CAUTION: Stresses above those listed in "Absolute Maximum Ratings" may cause permanent damage to the device. This is a stress only rating and operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied.

NOTES:

- Maximum power dissipation with load conditions must be designed to maintain the maximum junction temperature below 175°C for the ceramic package and below 150°C for the plastic packages. By using Application Note AN556 on Safe Operating Area equations, along with the thermal resistances, proper load conditions can be determined. Heat sinking is recommended above 75°C.
- θ_{JA} is measured with the component mounted on an evaluation PC board in free air.

NOTES:

- 14. $A_v = -10$.
- 15. Load Capacitance should be less than 10pF.
- 16. It is recommended that resistors be carbon composition and that feedback and summing network ratios be matched to 0.1%.
- 17. SETTLE POINT (Summing Node) capacitance should be less than 10pF. For optimum settling time results, it is recommended that the test circuit be constructed directly onto the device pins. A Tektronix 568 Sampling Oscilloscope with S-3A sampling heads is recommended as a settle point monitor.
