

Low Noise, Wideband, Precision Operational Amplifier

July 1994

Features

- This Circuit is Processed in Accordance to MIL-STD-883 and is Fully Conformant Under the Provisions of Paragraph 1.2.1.
- Gain Bandwidth Product 100MHz (Min)
- Unity Gain Bandwidth 30MHz (Min)
40MHz (Typ)
- High Slew Rate 25V/μs (Min)
37V/μs (Typ)
- Low Offset Voltage 0.75mV (Max)
0.30mV (Typ)
- High Open Loop Gain 106dB (Min)
128dB (Typ)
- Low Voltage Noise (at 1kHz) 5.8nV/√Hz (Max)
3.6nV/√Hz (Typ)
- Low Current Noise (at 1kHz) 2.0pA/√Hz (Max)
1.4pA/√Hz (Typ)
- High Output Current ±30mA (Min)
±56mA (Typ)
- Low Supply Current 10mA (Max)
8mA (Typ)

Applications

- Precision Test Systems
- Active Filtering
- Small Signal Video
- Accurate Signal Processing
- RF Signal Conditioning

Description

The HA-5221/883 is a high performance, dielectrically isolated, monolithic op amp, featuring precision DC characteristics while providing excellent AC characteristics. Designed for audio, video, and other demanding applications, noise (3.6nV/√Hz at 1kHz typ), total harmonic distortion (<0.005% typ), and DC errors are kept to a minimum.

The precision performance is shown by low offset voltage (0.3mV typ), low bias currents (40nA typ), low offset currents (15nA typ), and high open loop gain (128dB typ). The combination of these excellent DC characteristics with fast settling time (0.4μs typ) make the HA-5221/883 ideally suited for precision signal conditioning.

The unique design of the HA-5221/883 gives this device outstanding AC characteristics, including high unity gain bandwidth (40MHz typ) and high slew rate (37V/μs typ), not normally associated with precision op amps. Other key specifications include high CMRR (95dB typ) and high PSRR (100dB typ). The combination of these specifications will allow the HA-5221/883 to be used in RF signal conditioning as well as video amplifiers.

NOTES:

1. Parameters listed in Table 3 are controlled via design or process parameters and are not directly tested at final production. These parameters are lab characterized upon initial design release, or upon design changes. These parameters are guaranteed by characterization based upon data from multiple production runs which reflect lot to lot and within lot variation.
2. Full Power Bandwidth guarantee based on Slew Rate measurement using $FPBW = Slew\ Rate / (2\pi V_{PEAK})$.
3. Power Consumption based upon Quiescent Supply Current test maximum. (No load on outputs).
4. Measured between 10% and 90% points.
5. Input Noise Voltage Density and Input Noise Current Density limits are based on characterization data.
