

## LOW-NOISE DUAL OPERATIONAL AMPLIFIER

### ■ GENERAL DESCRIPTION

The NJM5532 is a high performance dual low noise operational amplifier. Compared to the standard dual operational amplifiers, such as the NJM4558, it shows better noise performance, improved output drive capability, and considerably higher small-signal and power bandwidths. It is compensated internally for voltage follower circuit. This makes the device especially suitable for application in high quality and professional audio equipment, instrumentation, control circuits, and telephone channel amplifiers.

If very low noise characteristic is of prime importance, it is recommended D-Rank type products(NJM5532DD/LD/MD). These have specified maximum limits for equivalent input noise voltage.

### ■ PACKAGE OUTLINE

NJM5532D (DIP8)

NJM5532L (SIP8)

NJM5532M (DMP8)

### ■ FEATURES

- Operating Voltage                     $\pm 3V \sim \pm 22V$
- Small Signal Bandwidth            10MHz typ.
- Output Drive Capability            600 $\Omega$ , 10Vrms typ.
- Input Noise Voltage                5nV/ $\sqrt{\text{Hz}}$  typ.
- Power Bandwidth                    140kHz typ.
- Slew Rate                              8V/ $\mu\text{s}$  typ.
- Bipolar Technology
- Package Outline                      DIP8, DMP8, SIP8

### ■ PIN CONFIGURATION

#### PIN FUNCTION

- 1.A OUTPUT
- 2.A -INPUT
- 3.A +INPUT
- 4.V<sup>-</sup>
- 5.B +INPUT
- 6.B -INPUT
- 7.B OUTPUT
- 8.V<sup>+</sup>

■ NOTICE

When used in voltage follower circuit, put a current limit resistor into non-inverting input terminal in order to avoid inside input diode destruction when the power supply is turned on. ( ref.Fig.1 )

(Fig.1)

■ Caution to Thermal Design

If the NJM5532 junction temperature ( $T_j$ ) exceeds guaranteed value (125 degree) or the package power dissipation ( $P_D$ ), there is possibility of the NJM5532 deterioration or breakdown.

The NJM5532 supply current is higher ( $I_{CCMAX}=16mA$  at  $V^+ / V^- = \pm 15V, T_a = +25^\circ C$ ) and has positive temperature coefficient (Refer to Supply Current vs. Temperature characteristic).

Therefore, you should carefully design with due attention to the supply voltage, the internal power dissipation and the ambient temperature.

■ Countermeasure to Excess Current by Parasitic Circuit

When the NJM5532  $V^+$  is open (Fig.2), the NJM5532 may be burnt flowing the excess current by internal parasitic circuit(Fig.3).The excess current generating condition is following:

- / Between input terminal and  $V^-$  voltage difference is higher.
- / Input terminal has no resistance of  $1k\Omega$  or more.
- /  $V^+$  terminal is connected with low impedance. (Ietc is higher)

Fig.2

Fig.3

For countermeasure to excess current by parasitic circuit, NJRC recommends the following method.

- / prevent operating of a parasitic circuit by inserting a SBD (Fig.4-1/4-2).
- / limiting a parasitic circuit operation by inserting a resistance ( $1k\Omega$  or more) (Fig.5).
